1. Public schools only.
2. Not including pre-vocational schools where there were 157 pupils enrolled in 1957/58, 150 in 1956/57, 185 in 1955/56, 154 in 1954/55 and 97 in 1953/54.
3. Not including part-time teachers who numbered 19 (F.7) in 1957/58, and 1956/57, 17 (F.5) in 1955/56 and 13 (F.5) in 1954/55 and 1953/54.
4. Including part-time teachers.
5. Including part-time students.
6. In addition, teachers of general secondary schools also gave lessons in teacher training schools.
7. Courses are held by teachers of general secondary schools.

THE EDUCATIONAL SYSTEM

The Federation of Malaya became an independent nation within the British Commonwealth on 31 August 1957. Under the new constitution the Federation Government has power to make laws with respect to: elementary, secondary and university education; vocational and technical education; training of teachers; registration and control of teachers, managers and schools; promotion of special studies and research; and scientific and literary societies.

The Education Ordinance of 1957, upon which the education system rests, is based on the recommendations of a Committee appointed in September 1955 'to examine the present Education Policy of the Federation of Malaya and to recommend any alterations or adaptations that are necessary with a view to establishing a national system of education acceptable to the people of the Federation as a whole, which will satisfy their needs and promote their cultural, social, economic and political development as a nation, having regard to the intention to make Malay the national language of the country whilst preserving and sustaining the growth of the language and culture of other communities living in the country'.

Under the Ordinance, the organization and administration of education is now shared between the Federation Government and local education authorities broadly as follows: (a) educational policy in general, secondary education, teacher training are the responsibility of the Minister of Education; (b) local education authorities are responsible for primary and trade education.

In framing its policy the Federation of Malaya faces a difficulty common to any nation with a plural society. Owing to historical factors intimately bound up with the development of the country, there are three principal races: Malay, Chinese and Indian. The difficulties attendant upon the diversity of languages—Malay, the various dialects of Chinese, and the languages of the sub-continent of India, are complicated by a similar diversity of religion and custom.

Present policy has the aim of creating a consciousness of Malayan citizenship which will unite the groups and encourage the use of Malay as the national language to promote understanding and solidarity. English, as a world language, is to be maintained, with Malay as an official language.

Financial provision for education is made, in the case of secondary schools, in the form of direct payment to the board of governors of each school, the monthly sum being 'the difference between fees collected and teachers' salaries'. Payment of recurring expenses incurred in the running of a school is by grant annually, excepting in the case of teachers' salaries. In the case of primary and trade schools, local education authorities distribute the money, which they receive part as a Ministry grant and part from education rates, to schools within their control.

At present there are 12 local education authorities, one for each State of the Federation (11) and one for the Municipality of Kuala Lumpur.

THE DEVELOPMENT OF SECONDARY EDUCATION

The development of secondary education in the Federation of Malaya was, until recently, almost entirely confined to the schools using English as the medium of instruction. The reason for this was a practical one: until the second world war English gave admission to higher studies, particularly in England, which were not then available in Malaya or South-East Asia. Graduate staff, mostly recruited from the United Kingdom, helped greatly in the part-time training of teachers recruited locally and trained through part-time courses (the 'normal-training system').

Thus the curricula pattern was based upon that of similar schools in England. The adoption of the Cambridge Junior and Senior Local Examinations, as set by the Cambridge Examinations Syndicate, ensured that syllabuses were parallel with those of English secondary schools. Although these examinations have been replaced by the Cambridge Oversea School Certificate and Higher School Certificate, this pattern is still maintained, though it is being continually modified to suit Malayan needs.

The period since the second world war has seen a tremendous increase in secondary education in English and the establishment of a Malayan University where English is the medium of instruction. The University was formed in 1949 through a fusion of Raffles College (founded 1928) and the King Edward VII College of Medicine (founded 1904). There are now two divisions of the University, one in Kuala Lumpur and one in Singapore.

Until 1958 there was no secondary education in the Malay medium except in teacher training establishments producing teachers for Malay primary schools. In 1958, however, Malay medium secondary classes were opened at various centres. Staffing in these classes is still a problem.

Before World War II secondary education in the Chinese medium was extremely restricted in the Federation and followed the traditional Chinese pattern. There was a tendency to send children back to China to complete their education. War in China from 1937 onwards and World War II interrupted this and the result has been a tremendous increase in the number of secondary (junior middle and senior middle) schools, many of which are independent of government financial assistance.

Administration

Secondary education is organized by the Minister of Education with the advice of the Permanent Secretary for Education and his staff and also on the advice of other advisory committees and agencies. For instance, advice on

school syllabuses is supplied by the General Syllabus Committee, and on Malay language and literature by the Literature Agency (Dewan Bahasa dan Pustaka).

Through his ministerial staff, the Minister controls the Chief Education Officers, each of whom controls the organization of secondary education within a state. The Chief Education Officer provides general administration while the schools themselves, within the general policy, are run by their principals and boards of governors.

The 1957 Ordinance made provision for a Federal Inspectorate which submits reports on all types of schools to the Ministry. Further supervision is also provided by the Chief Education Officers and their professional staff.

Parents' committees and parent-teacher associations are still in the early stages of formation and as yet exercise little influence on general policy or upon individual schools.

Finance. The Federal Government's expenditure on education is derived from the general revenue. Estimates are prepared a year in advance and submitted to the Federal Legislature for inclusion in the annual budget in the normal way. Grants are made to local education authorities for distribution to primary schools and trade schools and direct to boards of governors of secondary schools.

Schools may be built entirely on government grant, or receive partial aid, or be entirely the result of private effort.

Pupils are charged fees at the rate of 5 Malayan dollars per month in fully assisted secondary schools. Fees are collected monthly and the money made available monthly to each school represents the difference between expenditure on salaries and the school fees collected.

Assistance to parents takes the form of pre-university scholarships, federal minor scholarships, state scholarships, free places, and the subsidizing of hostels where Malay boys from rural areas are accommodated while attending schools in the towns.

A school medical and dental service is in operation but is in need of expansion.

TYPES OF SECONDARY EDUCATION

English-medium schools. These schools offer a 5-year course (forms 1 to 5) leading to the Oversea School Certificate examination of the Cambridge University Syndicate, or the Federation of Malaya Certificate of Education. Sixth forms take the Cambridge Higher School Certificate as preparation for a university course.

Pupils enter the school as a result of selection based upon a federal examination—the Secondary Schools Entrance examination. Those from schools whose language medium is other than English undergo a year's intensive course in English, before entry into form 1, in 'remove' classes in the secondary school.

This is in addition to the special opportunities which still exist for Malay children to convert from Malay medium to English during their primary course via 'special Malay classes'. A selection by examination, on a state basis, is made at primary 3 or 4 level in Malay primary schools, and the successful candidates enter special Malay classes in English-medium primary schools. They pass into standard 6 of the English school after a 2-year course with special emphasis on the English language. If successful in the Secondary Schools Entrance examination, these pupils go straight into form 1 in an English-medium secondary school.

The subjects generally taught are the national language (Malay), English language, literature, mathematics, general science, history, geography and art. Provision is also made for the teaching of Chinese and Tamil language and literature where the demand exists. Where staffing permits and there are workshop facilities, metalwork, technical drawing, cookery, needlework, etc., are taught.

Promotion is automatic up to the end of the third year, when pupils sit for a public examination—the Lower Certificate of Education. Only candidates satisfying particular conditions are allowed to go on to the 2-year courses leading to the School Certificate Examination or the 3-year courses in the technical institutes.

Sixth-form (2-year) courses divided into two streams, arts and science, are also provided at selected centres. They lead to the Cambridge Higher School Certificate examination, which qualifies pupils for entrance into most English-speaking universities throughout the world and is used as an entrance examination by the University of Malaya.

The subjects taught at this level are those of a normal pre-university course in science subjects, but arts subjects have additional options in Malay, Chinese and Tamil language and literature.

The teaching staff in English-medium secondary schools is mainly recruited in Malaya. At the lower levels teachers hold a School Certificate and take a 2 years' course in a teachers' training college in Malaya or in one of the two special colleges established in the United Kingdom.

At form 4 level and beyond, most teachers have degrees granted by the University of Malaya or diplomas from its predecessor, Raffles College. There are some with honours degrees from the University of Malaya and a decreasing number of people with honours degrees who were recruited overseas in the United Kingdom or in India.

Chinese-medium schools. This is a period of change for Chinese secondary schools and new patterns are still being formed. In the past, Chinese secondary schools offered a 6-year course—3 years in the junior middle classes, followed by 3 years in senior middle classes. Under the 1957 Education Ordinance a change is required to bring the course into line with other schools; some schools have already made the necessary alterations.

Schools may either prepare for the Lower Certificate of Education, taken in the English medium after 4 years, or for the Chinese Schools Promotion examination taken in Chinese after 3 years. Those which opt for the former may go on to the examinations for the Cambridge Oversea School Certificate or the Federation of Malaya Certificate, while those which keep to the Chinese medium prepare for the Chinese Schools Leaving Certificate.

Traditionally all Chinese schools have been run by management committees who have financed the school and run it on their own lines. The 1957 Ordinance requires that, in order to qualify for full assistance, Chinese schools shall eventually be run as other secondary schools will be—

i.e., by boards of governors—and that they shall prepare for the Lower Certificate Education and the School Certificate/Federation of Malaya Certificate examinations.

Partially assisted Chinese-medium secondary schools are at present graded—those assigned to grade 1 receive a *per capita* government grant of $36 per pupil per year, while those in grade 2 receive $21 per pupil per year, and in grade III $15 per year.

The teaching staff of Chinese secondary schools is now appointed by the management committees. The majority of teachers at the lower levels have usually passed either senior middle 3 or junior middle 3 and have undergone 2 years' part-time teacher training ('Chinese normal-trained'). In senior middle classes most of the teachers have either been college trained in China or possess Chinese university degrees.

With effect from 1958 special provision has been made for the training of Chinese-medium teachers at the Malayan Teachers' Training College in Penang and from 1959 at the Language Institute in Kuala Lumpur. Selection is from among those who have passed senior middle 3 with distinctions in Chinese and credits in English.

Malay-medium schools. In 1958 a start was made in providing secondary education in Malay, when Malay-medium classes were opened in existing English secondary schools. These follow the academic pattern of the English-medium school and will eventually offer candidates for the Lower Certificate of Education Examination in the Malay medium.

Vocational and technical schools

Secondary schools. Greater emphasis is now being placed upon technical training and more practical subjects are being introduced into the previously entirely academic school curriculum. Many large secondary schools have been provided with metal and woodwork shops, and equipment for technical drawing. Where these facilities are available the aim is that pupils with a practical bent should take these subjects up to School Certificate level.

In an increasing number of schools facilities are also available to study commercial subjects to the same level.

Staff is drawn from amongst ordinary non-graduate teachers who have undergone specialist training for the work.

Technical institutes. At present there are two in the Federation, one in Penang and one in Kuala Lumpur. They provide a 3-year course from Lower Certificate of Education level up to the level of the Oversea School Certificate/Federation of Malaya Certificate examinations in general education, together with mechanical engineering, electrical engineering and building construction. During the third year pupils are sent for 3 months' training in industry.

These technical institutes have grown up out of the old junior technical trade schools, which they are replacing.

The lecturing staff falls into three categories: those with engineering qualifications from the Technical College plus 2 years training in the United Kingdom; senior instructors who have passed the final City and Guilds examination (London) and have some teaching experience; and instructors who are college-trained teachers.

The Technical College. This college, which has residential accommodation for 500 students, is situated in Kuala Lumpur. It offers 3-year courses in civil, electrical, mechanical and radio engineering, and land surveying and architecture, leading to a diploma which is accepted as a qualification for entry into government technical departments at 'technical assistant' level. The minimum qualification for entry is a grade 2 School Certificate in the Cambridge Oversea School Certificate examination with credits in Malay or English, mathematics and general science.

The lecturing staff is at present made up of Indian university graduates and persons holding professional qualifications from the United Kingdom, while all heads of departments have honours degrees in engineering subjects from recognized universities.

Rural trade schools. These schools are new and experimental. Like primary schools, they are the responsibility of local education authorities. The six schools in the Federation cater largely for Malay boys who have completed their primary education. Tuition is in Malay and the courses follow a syllabus which emphasizes the practical aspects of general building and mechanical work.

Staff is recruited from tradesmen in industry or from among instructors with experience in the old junior technical trade schools.

Teacher training schools

The great expansion in educational facilities since 1946 has necessitated a radical revision of the old 'normal-training' system by which teachers underwent professional training at week-ends whilst at the same time observing and practising in the schools.

Primary teacher training. In 1957 the Day-Training College/Centre Scheme was introduced. Twelve centres have now been established throughout the Federation to supplement the 3 residential colleges—Sultan Idris Training College, Tanjong Malim, Malay Women's Training College, Malacca, Kota Bharu Training College—which were then in existence. All of these make use of both Malay and English and 10 of them offer instruction through the medium of Chinese as well.

The minimum qualification for entry into 'day training' is a pass in the Lower Certificate of Education examination, but special arrangements are made for the admission of candidates from Chinese-medium schools not yet preparing for the L.C.E.

Courses are divided so as to give students 2 years' full-time instruction, broken by several weeks' practical teaching in schools, followed by a year of full-time teaching with formal instruction only in week-end classes.

Lecturing staff in these day-training college centres are teachers with at least 5 years' practical experience.

About 1,000 Malay School teachers in remote areas are receiving part-time training by correspondence from a staff specially trained for this work in Australia, under the Colombo Plan.

Secondary teacher training. There are four colleges for secondary teacher training. Two are in the United Kingdom and

two in Malaya. One in England pays special attention to producing teachers of English, and one in Malaya (the Language Institute) to providing teachers of the national language and other languages commonly in use in Malaya.

The minimum qualification for admission to these colleges is a Federation of Malaya Certificate of Education/ Cambridge School Certificate or a pass in the senior middle III examination with a distinction in Chinese.

The staff, whether from India or the United Kingdom, or local officers, all have university degrees and appropriate teaching and training experience.

The Vocational Teacher Training College. This offers to trained teachers a 1-year course in woodwork and metalwork leading to competence to teach those subjects up to form 3 level in secondary schools. There are also advanced courses in the same subjects for teachers of forms 4 and 5.

Instructors are trained teachers with teaching experience and City and Guilds Certificates.

Out of class activities

All types of secondary schools have well-developed extra-curricular activities: various sports, cultural clubs ranging from art and photographic societies to literary, debating and dramatic societies, Boy Scouts, Girl Guides, Boys' Brigade, the St. John's Ambulance and Red Cross organizations, Army Cadet and Air Training Cadet Units, etc.

TRENDS AND PROBLEMS

Fundamental to the consideration of trends and problems are: (a) the great increase in the school population from 1946 (404,319) to January 1959 (1,248,831); (b) trade recessions, particularly affecting the price of tin and rubber, the source of most of the Federation of Malaya's revenue.

Since 1956 the aim of government policy has been to bring primary education within the reach of all children. By 1958 this had almost been accomplished, although the stage at which primary education can be declared free and compulsory for all has not yet been reached.

The increase in school population has naturally already begun to affect secondary schools, and the problem of financing new schools and extending existing ones in the face of financial stringency is already urgent.

The supply of honours graduates with teaching diplomas has not been able to keep pace with the expansion of secondary education. The shortage of science teachers has been particularly acute. However, it is likely that in the near future the University of Malaya will be able to come closer to meeting the demand.

Industrialization poses various other problems. In spite of the increasing demand for rural schools as the rural population realizes the need for education, the demand for urban schools continue to grow in proportion with the drift to the towns. Secondly, it is becoming increasingly obvious that not all who find their way into secondary schools are fitted for an academic career, nor does an academic career necessarily suit the opportunities for employment that exist in modern life. School Certificates are no longer a passport to a successful career, and there is an increasing need for more technical and vocational training to fit people for work in the new industries.

While this is sufficiently obvious to planners wrestling with financial restrictions in order to meet the need, it is not so obvious to the general population. Malaya faces the problem common to many countries, that tradition has accorded extra kudos to white-collar jobs, and there is a shortage of those who wish to become engineers and technicians below university degree level. It is the problem of the educated unemployed, or of the man forced to do a job that he thinks is beneath his dignity.

Another fundamental problem is that of language within the school system. It is intimately bound up of course with the need to create a Malayan nation out of our plural society.

It is the government's policy to increase the use of Malay until it is in fact, as well as name, the national language. Malay is a compulsory subject in every government and assisted school, and fluency in the language will eventually become a condition of entry into government service. Initially this will throw a strain on suitably qualified staff since at the same time Malay secondary classes are being set up and make their own call upon Malay-speaking teachers. It is to satisfy this special demand that the Language Institute has been opened.

At present Malay and English are official languages. For some time to come, it is probable that English, offering the same advantages as Latin did in medieval Europe as a *lingua franca*, will continue to be used, especially in higher education. However, a great deal of education is still carried on in the Chinese medium.

STATISTICS

Population (mid-year 1958 estimate): 6,515,000.
Area: 50,690 square miles; 131,387 square kilometres.
Density: 129 per square mile; 50 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, total enrolment was about 1,118,000 not including handicapped children attending special schools and persons attending

adult education courses; this represented about 18 per cent of the total population. There were also 1,134 students enrolled at the University of Malaya, then located only in Singapore, and some 1,700 students overseas (in Australia and the United Kingdom). From 1953 to 1957 total enrolment in pre-primary, primary, secondary, and vocational schools and in teacher training centres increased by approximately 40 per cent.

In 1957/58, primary schools accounted for 87 per cent of the total enrolment, general secondary schools 11 per cent, vocational schools 0.9 per cent, teacher training institutions 0.7 per cent. The proportion of girls was 41 per cent in primary schools, 36 per cent in general secondary schools, 40 per cent in vocational schools. The proportion of women on the teaching staff was 32 per cent in primary schools (29 per cent in 1953/54), and 29 per cent in general secondary schools (28 per cent in 1953/54). The pupil-teacher ratio in primary schools was 33 (32 in 1953/54). (See Table 1.)

Enrolment trends in secondary education, 1949–57. Table 2 shows rapid expansion of both general and vocational secondary education between 1949 and 1957, so that the 1957 enrolment in each case was more than five times as high as in 1949. As to teacher training, there was an increase in enrolment from 1950 to 1953, but a subsequent decline reduced the 1957 enrolment to only 70 per cent of the enrolment in 1950. Nevertheless, taking all three categories together, the average total enrolment for the period 1955–57 was nearly twice the average enrolment for 1950–54 and possibly three times as high as the 1949 total enrolment. For the period 1955–57, the ratio of total secondary enrolment to the estimated population 15–19 years old stood at 22.

Examination results in secondary education, 1953–57. From 1953 to 1958 the number of successes in the Cambridge School Certificate examination increased by 48 per cent. The number of London Chamber of Commerce certificates awarded in 1957/58 was 3 per cent more than in 1954/55. The ratio obtained by relating the number of certificates granted to the number of pupils enrolled in the corresponding course was higher for teacher training than for the other types of education under review. (See Table 3.)

Educational finance, 1957. During the fiscal year beginning in January 1957, nearly 120 million Malayan dollars was spent on education, representing 19 Malayan dollars per inhabitant. This does not include a grant of $4,250,000 made to the University of Malaya. Of the total expenditure, 92 per cent came from federal government funds. Capital expenditure was nearly 9 per cent of the total. (See Table 4.)

MEXICO

THE EDUCATIONAL SYSTEM

The present educational system came into being as a result of the Mexican Revolution of 1910. In addition to its economic and political aims the revolutionary movement set itself objectives of a social nature, with particular emphasis on culture and education. Once the armed struggle was ended, consideration was given to the urgent need—side by side with an improvement in the living conditions of the masses—of organizing an extensive educational system which could bring about the cultural advancement of broad sections of the population and the creation of a full sense of nationhood while ensuring the continuous progress of the work of emancipation.

The triumph of the revolutionary movement was followed by the promulgation of the Political Constitution of 1917, in which the central principles for which the struggle had been so resolutely waged found their legal embodiment.

Presenting in an integrated form all aspects of Mexican political and social thinking, the Constitution as a whole is a fountain-head of educational doctrine, although it is Article 3 which is specifically concerned with the control and organization of the educational system.

The present Article 3, which has been in force since 1946, reads as follows:

'The education imparted by the State—the federation, states or municipalities—shall tend towards the harmonious development of all the human faculties, and at the same time foster patriotism and the sense of international solidarity based on independence and justice.

'I. With freedom of religious belief guaranteed by Article 24, the guiding principle of such education shall be to remain aloof from any religious doctrine whatsoever and, in the light of the results of scientific progress, to combat ignorance and its effects—servitude, fanaticism and prejudice.

'Furthermore, (a) it shall be democratic, bearing in mind that democracy is not only a juridical structure and a political system but also a way of life based on the continuous economic, social and cultural advancement of the people; (b) it shall be national, in so far as its aims are to promote—while eschewing hostility and exclusivity—an understanding of our problems, the development of our resources, the defence of our political independence, the safeguarding of our economic independence and the continuity and progression of our culture; (c) it shall contribute towards better human relations, both by the contribution it makes towards inculcating in the pupil not only a respect for the dignity of the individual and the integrity of the family but also a firm belief in the importance of the common good, and by the attention it pays to fostering the ideals of fraternity and the equality of rights of all men, avoiding privileged treatment in respect of a particular race, sect, group, sex or individual . . . .'

Under the new Public Education Act, of 23 January 1942, which regulates Articles 3, 31 (Section I), 73 (Sections X and XXV) and 123 (Section XII) of the Political Constitution of the United States of Mexico, the national educational system embraces the schools, institutes, laboratories and scientific research centres depending directly or indirectly on the State, and the cultural activities conducted by them, the private primary, secondary, and teacher training schools, and schools of any type or level specially designed for workers and peasants, which operate under legal authorization, and the special private schools and institutes of all types which are officially recognized.

The national educational system covers the following types of education: pre-primary, primary, secondary, teacher training, vocational and preparatory, higher technical and professional, including universities; education imparted in laboratories or scientific research institutes, including universities; out-of-school education, including that given at universities, and imparted at schools providing special types of education not included among those already mentioned. The structure of the system is shown in the diagram on page 821.

Role of the public authorities

The federation, the states and municipalities share in the provision of education, the major responsibility devolving on the Federal Government. At federal level educational and cultural matters come within the province of the Secretariat of Public Education, the functions, scope and powers of which are prescribed by the State Secretariats and Departments Act of 30 December 1939, now in force, with certain amendments and additions.

Some of its more important tasks, as laid down in this Act, are as follows: to see that the various types of education on which the national educational system is based are all made available in the appropriate schools, and to provide physical training and artistic education in schools; to supervise and control public education; to exercise administrative and technical control over all schools of whatever type set up by the Federation, with the exception of those maintained and technically directed, in accordance with the law, by other state secretariats or departments; to ensure observance of the legal provisions governing primary, secondary and teacher training education in private schools and to prescribe the measures to be applied to carry them into effect; and to exercise similar supervision over the private technical, industrial, commercial and higher schools coming under the federal educational system; to establish a system of promotion and insurance for teachers; to establish equivalence of university studies, diplomas, titles or degrees; to regulate the exercise of the professions.

The Secretariat also has wide responsibilities for the promotion of art, archaeology, science, music, the theatre, sport, etc.

In pursuance of these manifold functions the Public Education Secretariat has set up appropriate directorates, departments and institutes, including directorates-general for primary education in the federal district, primary education and inspection in the states and territories, teacher training, agricultural training, regional technical and special schools, pre-primary education, Indian affairs, social welfare, the liberal professions, legal affairs and educational equivalences, audio-visual aids, school hygiene, literacy and out-of-school education, higher education and scientific research, and administration. It has also established the National Institute of Fine Arts, the National Institute of Anthropology and History, the National Polytechnical Institute, the Youth Institute, the Federal Institute for Advanced Teacher Training, the Pedagogical Museum, and other special institutions.

The governments of the federated states, which, as indicated, share with the Federal Government in exercising the social function of providing education, maintain and direct their own state school systems which in many cases cover the entire range from pre-school to university. The Public Education Act already referred to regulates educational activity throughout the Republic both on the federal level and in the states, municipalities, federal district and federal territories.

The state governments have their own education directorates, which control and direct school activities, and where there are university institutes special departments have been set up to take charge of this type of higher education.

In order to promote the technical unification of education throughout the Republic, the Public Education Secretariat has attached to itself a National Technical Council of Education (Consejo Nacional Técnico de la Educación) which is an advisory body of the secretariat itself and of the federated states; while a Joint Education Board (Comisión Mixta de la Educación) operates in each of the latter as a co-ordinating body between the states and the federation.

Role of private agencies

The existence of private interests in education is recognized by the State. However, this recognition is subject to statutory legal provisions, which are laid down in Sections II, III, IV and V of Article 3 of the Constitution.

'II. Private individuals may impart education of all types and levels; but in the case of primary and secondary education, teacher training, and education of any type or level designed for workers and peasants, they must receive the prior authorization of the public authorities. Such authorization may be refused or revoked without the possibility of legal or other redress.

'III. Private schools imparting education of the types or levels specified in the foregoing section must adapt themselves unreservedly to the provisions of Sections I (the text of this has already been given) and II above, and must also comply with the official curricula and syllabuses.

'IV. Religious bodies, ministers of religion and limited liability companies engaging, either exclusively or predominantly, in educational work, and associations or societies connected with the spread of any religious belief whatsoever, shall take no part in any form in the affairs of schools where primary and secondary education, teacher training or special education for workers and peasants are imparted.

'V. The State may, at its discretion and at any time, withdraw its official recognition of the instruction given at private schools.'

THE DEVELOPMENT OF SECONDARY EDUCATION

The history of modern secondary education in Mexico can be divided into two periods. The first was inaugurated in effect by the Law of 2 December 1867 which established, on the initiative of Dr. Gabino Barreda, a direct disciple of the philosopher August Comte, the National Preparatory School (Escuela Nacional Preparatoria) with a curriculum based on the hierarchy of sciences drawn up by the founder of French Positivism. The second stage began in 1926 with the establishment of the present system of general secondary schools, thanks mainly to the efforts of Professor Moisés Sáenz.

The preparatory school system was soon adopted by the governments of all the federated states, which set up schools known as *institutos* or *colegios*. During the succeeding 50 years or so the curriculum, which was the same for all pupils, underwent various reforms and counter-reforms, the fiercest attacks of its opponents being directed against its positivist bias. Nevertheless, it was able to maintain itself more or less intact until the end of the first decade of the present century.

But the Revolution of 1910 had its own demands to make as regards the solution of educational problems, while the study of developments in Europe and the United States of America also contributed to the reform of Mexican education. It was realized that neither the *Escuela Nacional Preparatoria* nor other schools following the same system were in a position to provide a secondary education accessible to large sections of the population, since they were based on a curriculum designed purely to prepare students for entrance to university and a professional career. Persons who could not afford to continue their studies at a professional school were doomed to a sense of failure.

There were two things about these schools, as Professor Sáenz observed, that were most noticeable. The first was the divorce between the intelligentsia and the working classes—between the preparatory schools which produced graduates, and the technical schools which produced 'practical men', and also between the institutes attended by the sons of the well-to-do middle class, young patricians or children enjoying special privileges, and the trade and vocational schools attended only by the poor. The second was that far too many children failed to complete their studies at the preparatory schools.

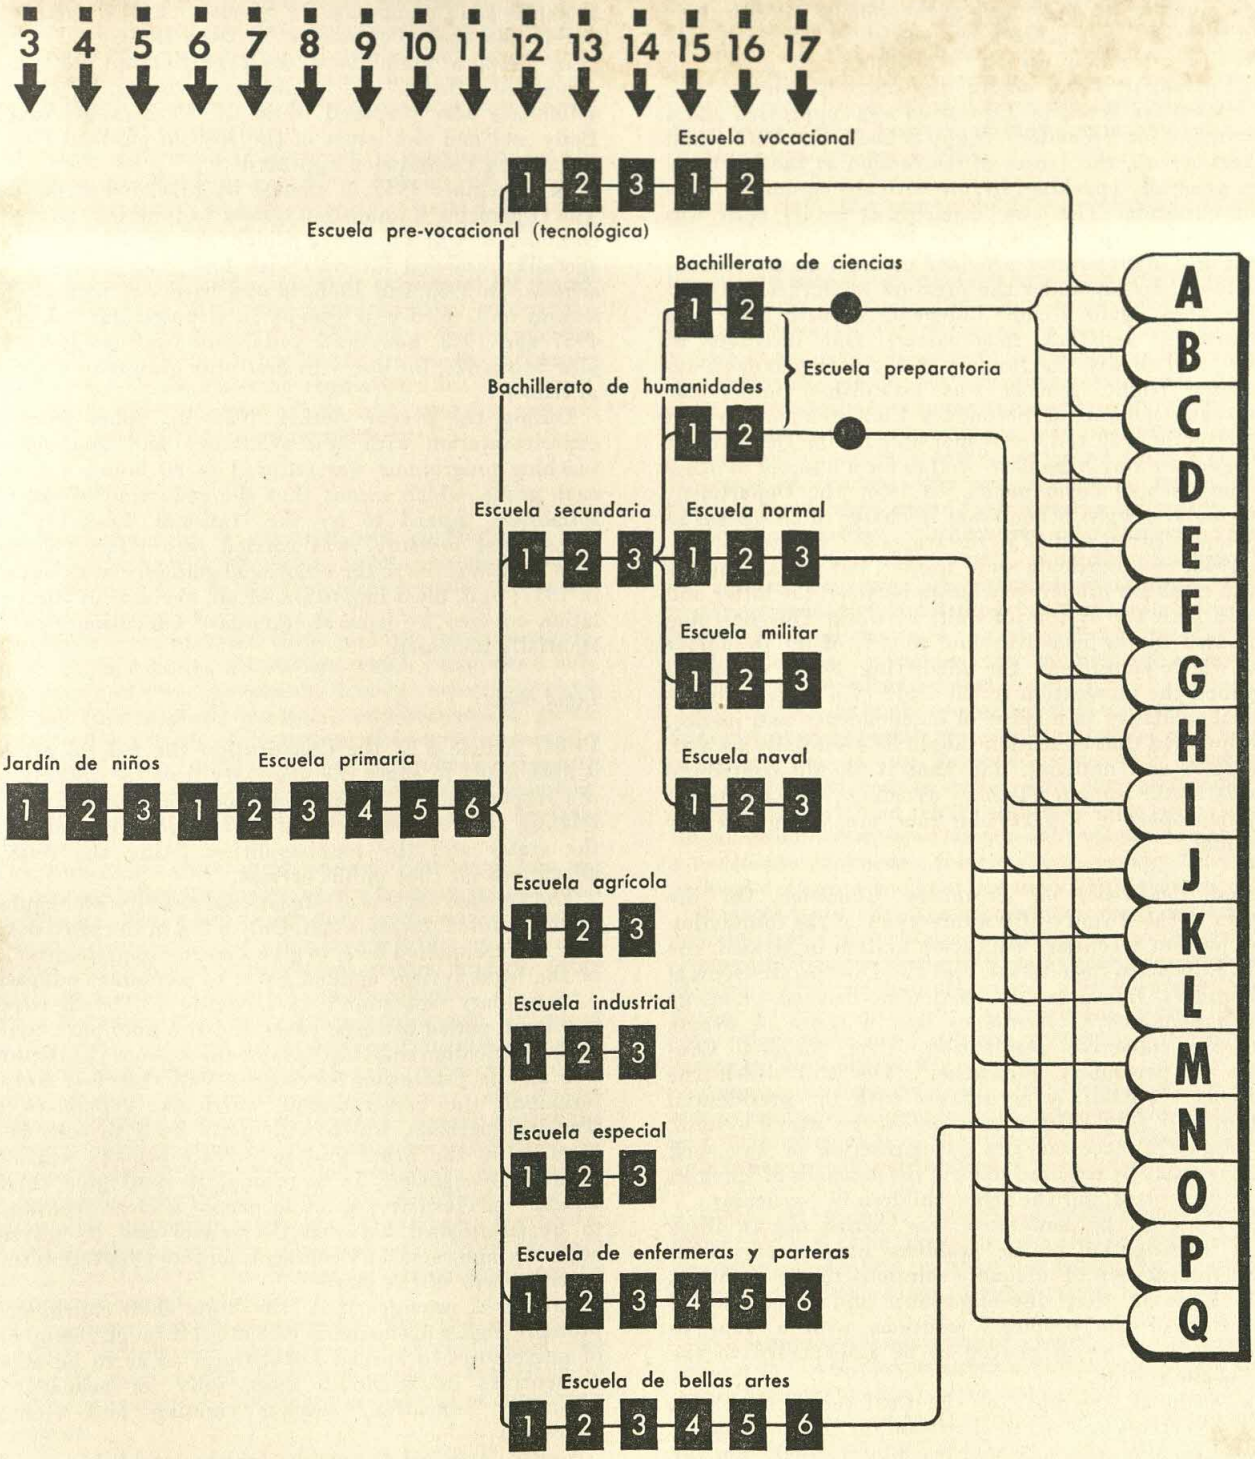
The 1926 reform. In 1917, when Dr. Sáenz was director of the Escuela Nacional Preparatoria, he and a group of teachers tried to find a solution for the problems raised by

this type of school, but the results were not very satisfactory. He then travelled extensively over Europe, where he studied reforms in secondary education. It was not a question, however, of copying any of the European systems but rather of gaining a clear insight into the trends of secondary educational reform throughout the world in order to find a suitable solution to Mexico's own problems in that respect, making due allowance for the requirements of the national situation. That solution could not, of course, be completely original or completely different from the solutions applied to similar problems in other countries, since their experience was bound to be the same in regard to many aspects of the problem.

In 1923, the course of instruction at the Escuela Nacional Preparatoria and teacher training schools in the federal district was split up into two cycles, the first of which, covering 3 years, was designed as the secondary cycle, while the rest of it constituted the preparatory cycle proper and the vocational cycle at the teacher training schools.

The groundwork for the reform of secondary education having thus been prepared, two presidential decrees were issued to give it legal effect. The first, dated 29 August 1925, authorized the Public Education Secretariat to set up secondary schools suitably organized in accord with established law and democratic educational principles. These secondary schools were to be equivalent as regards curriculum and standard to the so-called 'secondary cycle' of the Escuela Nacional. The second, dated 22 December 1925, provided for the complete separation of the Escuela Nacional secondary cycle in buildings other than those intended for the preparatory cycle, and set up a Directorate for Secondary Education (which began operations on 1 January 1926) within the Public Education Secretariat. In 1926, also, the new integrated system of secondary education was initiated, covering five different types of school: two resulting from the detachment of the secondary cycles at the Escuela Nacional and the National Teacher Training School (the latter being created in 1925 by the merger of the two teacher training schools in the federal district); another two which began to function in mid-March; and a night school for adults which was transferred to the directorate's control in June and which constituted the secondary cycle of the Preparatory Night School.

The Directorate was authorized, at the time of its foundation, to take charge of the inspection and control of private secondary schools, and the field of action of the new system went on extending in that direction. On 16 November 1926, a decree was issued specifying the conditions for incorporating private schools into the official system for the secondary cycle. A series of conditions were therefore laid down governing the school and its equipment, the teaching staff, the curriculum and the organization of work. In 1927, there were 11 incorporated private secondary schools, including 10 in the federal district. In 1958, there were 409.



The socialist bias in secondary education. Following this process, which might be described as the initial and foundational one in the system of general secondary education, the most important change in it occurred during the term of office of President Cárdenas (1934–40), as a result of the amendment in December 1934 of Article 3 of the Constitution. The effect of this was to give to primary and secondary education, teacher training and education for workers and peasants, a socialist impress, this tendency being specially marked in the history, geography and civics syllabuses. A great impetus was also given at that time to the establishment of secondary night schools for workers, of which there were 2 in 1934, with 1,566 students, and 28 in 1940, with 4,816 students. To direct them the Public Education Secretariat set up a Department for Workers' Education which was also responsible for a considerable number of primary night schools, trade night schools, boarding schools for workers' children and a preparatory

GLOSSARY

bachillerato de ciencias: see *escuela preparatoria.*
bachillerato de humanidades: see *escuela preparatoria.*
escuela agrícola: vocational training school of agriculture.
escuela de bellas artes: vocational training school of music, dancing or fine arts.
escuela de enfermeras y parteras: vocational training school for nurses and midwives.
escuela especial: vocational training school for industrial and commercial occupations.
escuela militar: vocational training school (army).
escuela naval: vocational training school (navy).
escuela normal: teacher training school.
escuela preparatoria: upper general secondary school with courses leading to baccalaureate in science (*bachillerato de ciencias*) and arts (*bachillerato de humanidades*), and a baccalaureate of general type (*bachillerato único*).
escuela pre-vocacional (tecnológica): lower vocational secondary school.
escuela primaria: primary school.
escuela secundaria: lower general secondary school.
escuela vocacional: upper vocational secondary school.
jardín de niños: pre-primary school.

school. Some of the secondary night schools were sections of the 9-year night schools opened in 1938, which also covered the 6 years of primary schooling.

In December 1940, under the next President, the Department for Workers' Education was suppressed and a Department for Secondary Night Schools for Adults and Workers set up, the course of instruction at these schools being, generally speaking, in line with the secondary day-school curricula. The new department in its turn was suppressed in January 1943, and its schools were transformed into night courses provided at the ordinary secondary schools. Later, under the pressure of workers' organizations, they again became independent, with their own headmasters, assistant headmasters and directors of studies, and finally, in January 1947, a Department for Secondary Night Schools was established under the Directorate-General for Secondary Education, which had been set up in 1940 and was responsible for the Department for Secondary Day Schools as well as for a number of other secondary school departments. In 1958, the Department for Secondary Night Schools was in charge of 28 schools in the federal district and 42 in the states and territories.

In 1945, new curricula were worked out for all courses so as to establish proper correlation between the latter and to fit in with the system of units of work. This new line culminated in the constitutional reform of 30 December 1946, which suppressed the qualifying term 'socialist', prescribed the inculcation in the child of a sense of international solidarity in a spirit of independence and justice, and stipulated that education should be essentially secular, democratic and national, and that it should contribute towards better human relations, avoiding privileged treatment in respect of a particular race, sect, group, sex or individual.

National Conference on Secondary Education. On the occasion of the twenty-fifth anniversary of the foundation of the present secondary education system in Mexico, the Public Education Secretariat, and the Directorate-General of Secondary Education, in particular, decided to merge the commemorative ceremonies into a series of events under the collective designation, 'The National Conference on Secondary Education'. The aim which the conference set itself, in accordance with the presidential sanction of 6 July 1950, was to assess the school system, and propose if necessary its reconstruction or any such changes as may be required to meet the demands of Mexican society in general and the schoolchildren in particular.

The work of the conference was carried out in three stages: investigation of the problems of secondary education; formulation of adequate solutions to the problems emerging from that investigation; and experimental application of the proposed solutions with a view to extending those which proved to be satisfactory to the whole of the system.

The National Assembly of the Conference laid down general directives and detailed criteria for the formulation of new curricula, syllabuses and teaching methods, but the 12 days during which it met were too short a time to allow it to complete the work of formulation. It therefore set up a Policy Committee of the Organizing Commission, a Commission for General Secondary School Curricula and Syllabuses, a Commission for Special School Curricula and Syllabuses, and a Permanent Advisory Body.

In 1952, a preliminary draft curriculum for general secondary schools and preliminary drafts of the new syllabuses were prepared while the Permanent Advisory Body met and two issues of the *Revista* published by the Organizing Commission appeared.

In December 1952, a change in government occurred. The Organizing Commission ceased to function, and a new commission was appointed which prepared a curriculum specially intended for trial with first-year groups in two schools. In 1955 and 1956, it was tried out with all first, second and third-year groups in a particular school. In 1957 and 1958, new draft syllabuses were prepared, and also textbooks, for use with first-year groups in a number of schools.

During the 6-year period 1953–58, apart from this experimentation with new syllabuses and methods, the teaching programme was reduced to 30 hours a week in each grade, which meant that the reduction of the 1945 syllabuses, agreed to by the National Assembly as a transitional measure, was carried into effect; a strong impetus was given to the vocational guidance work initiated in 1947; and, most important of all, the size of the population covered by general secondary education was substantially increased.

Legal basis

Under Article 3 of the Constitution the federal congress is authorized to enact the necessary laws for apportioning the responsibilities for public education, including those relating to secondary education, between the federation, the states and the municipalities, fixing the requisite allocations for that public service.

The detailed aspects of educational activity are regulated by the Public Education Act. Only a few of the provisions of this Act are quoted here, to give a more comprehensive idea of the legal system applied by it to secondary education.

'Secondary education', says Article 73, 'shall cover a minimum period of three years and the minimum content of the curriculum shall be the same throughout the Republic. The Public Education Secretariat will therefore have to formulate the corresponding curricula, syllabuses and teaching methods, which will apply both to schools depending on the State and to private schools which are officially recognized. In so doing, it shall give them a measure of elasticity, so as to permit a close relationship to be established between the school and its physical, economic and social environment, and its adaptation to the specific needs of the pupils.'

Article 92 provides that 'the State shall endeavour to promote higher professional education through the medium of universities or special institutions, so as to be able to concentrate its resources more fully on primary and secondary education, teacher training and technical education . . .' .

Lastly, Article 119 provides for the establishment of an advisory body of the Public Education Secretariat and the Federated States, known as the National Technical Council of Education, to be responsible for formulating or studying curricula, syllabuses and teaching methods for the various

types and levels of education, including secondary education, and to investigate problems relating to the organization and administration of schools and methods of achievement evaluation. The council includes representatives of the federation, the federated states and leading Mexican cultural institutions.

Secondary education is governed in particular by the Regulations for Work in Secondary Schools, of 1 August 1946. This enactment classifies schools as general secondary schools or special secondary schools; it defines the functions of the principal, assistant principal-secretary, inspectors-general, directors of studies (*jefes de enseñanza*) for special subjects, teaching staff and administrative and maintenance staff; it lays down the conditions for enrolment, the rights and duties of the pupils, the criteria for evaluating pupils' progress, as also the regulations for the pupils' associations, parents' associations and study groups set up for each speciality by serving teachers.

Administration

Secondary education is directed and controlled in accordance with the legal provisions mentioned above, which confer responsibility in that connexion upon the Public Education Secretariat.

The latter has entrusted these tasks to the Directorate-General for Secondary Education, which comprises a sub-directorate and six departments dealing respectively with technical (pedagogical) matters, administration, public secondary day schools in the federal district, secondary day schools outside the federal district (*secundarias foráneas*), secondary night schools and recognized private secondary schools incorporated in the national system (*escuelas encorporadas*).

The Sub-Directorate of Secondary Education has the main responsibility for questions of a technical nature, and therefore has direct links with the Technical Department and is also responsible for prior investigation in connexion with the appointment of inspectors-general and the other officials responsible for control and supervision.

On 4 February 1959, an Advisory Technical Section of the Directorate-General of Secondary Education was set up to study and propose solutions for the technical problems submitted to it by the Directorate-General and to recommend suitable measures to improve the standard of the secondary teaching staff. It has permanent committees for educational planning, curricula and syllabuses, pedagogical research and vocational guidance, teaching methods, achievement evaluation and school supervision, textbooks, and out-of-school activities. The chairman of this advisory body is the head of the Technical Department of the Directorate-General.

The persons mainly responsible for the control of secondary schools are: the principal of the school, the Director of Studies, the Inspector-General, the Head of Department concerned, the Director-General of Secondary Education.

Supervision and inspection. The actual work of school inspection devolves on the inspectors and directors of studies. Since 1953, these officials come under the departments whose schools they are required to supervise, and they conduct their activities in accordance with the instructions emanating from those departments and the provisions of the Regulations for Work in Secondary Schools. The inspectors supervise the general organization, administration and operation of the schools, while the directors of studies deal with all matters relating to teaching in their respective specialities.

Teaching staff. The responsibility for selecting secondary teachers rests with the Directorate-General of Secondary Education, working through the sub-directorate. In accordance with the Professions Act, the teachers appointed are those who have specialized in a particular course either at the Higher Teacher Training School (Escuela Normal Superior) or at the Faculty of Philosophy and Letters of the National Autonomous University of Mexico, the only limit on appointments being the budget allocation.

The appointed teachers begin with an initial period of 6 hours of classwork a week, and then come under the Directors of Studies, who are responsible for allocating them to the schools where their services are required.

Secondary school teachers are classified as follows: (a) class teachers of various categories (A-B-C-D-E); (b) subject teachers; (c) workshop instructors; (d) art teachers (for drawing, modelling, music, physical education); (e) experimental class and workshop assistants; (f) prefects (*prefectos*)—who supervise the pupils; (g) vocational advisers; and (h) directorial staff.

The directorial staff, consisting of the principal and an assistant principal-secretary, are in charge of all the other categories. To qualify for such posts, they must have previously performed the duties of the successive categories of class teacher and have obtained from the National Registration Commission (Comisión Nacional de Escalafón) a certificate confirming their right to occupy those posts without detriment to the interests of third parties.

In accordance with the regulations, every school has a general pupils' association comprising separate specialized groups which promote the civic and social education of the children. They include clubs of various kinds (sports, music, literary, dramatic, recreational, public service, school decoration, etc.) and are an effective instrument for corporate discipline in the schools.

There are also parent-teacher associations whose specific aim is to ensure co-operation in achieving the educational and social objectives of the schools. These associations are linked together in a federation.

Finance. At present, the Public Education Secretariat allocates 50 million pesos to the Directorate-General of Secondary Education, most of this sum going to cover the salaries of the teaching, administrative and maintenance staff.

The following are examples of monthly salaries: inspector-general for secondary education, 2,691 pesos; principal of secondary night school in the federal district, 2,009 pesos; principal of secondary day school in the federal district, 2,583 pesos; class teacher, category A, 1,138 pesos; class teacher, category E, 2,153 pesos; subject teacher in the federal district, 99 pesos an hour.

To meet the other costs of maintaining the school, public schools have additional funds, such as those accruing

from their share of the 'minor expenses' fund (300 pesos a year), and the income they receive for special examinations and copies of documents. As the total funds from all these sources are insufficient, the parents' associations have agreed to the establishment of a *cuota de cooperación*, to meet the most urgent needs, which takes the form of an annual enrolment fee of 30 pesos per pupil.

The limited amount budgeted every year for the establishment of new schools in the states and territories makes it very difficult to meet the requests made in this connexion. It is already impossible, in these circumstances, to establish new schools depending entirely on the federal authorities, which is why the system has been developed of schools in co-operative status, with equal sums payable by the federation and the local authorities and compulsory participation by the other interested sectors, organized into patronage committees and responsible for looking after the material side.

However, as the federal authorities have still found it impossible by these means to meet all the requests for establishing secondary schools in different parts of the country, recourse has had to be had to the system of subsidies, although on a small scale, to schools needing assistance. These subsidies range from 6,000 to 40,000 pesos a year.

Buildings and equipment. In general, secondary school premises are inadequate. Most of the schools are housed in unsuitable buildings which fail to provide proper teaching conditions, the only justification for this being necessity. The Public Education Secretariat is responsible for paying the rent of those buildings which are not the property of the nation; it also pays the charges for electricity, water, telephone and other public services.

Another aspect of this problem is the inadequacy of furniture and equipment.

School welfare services. The main welfare services conducted at secondary schools are vocational guidance, social work and school medical care.

TYPES OF SECONDARY EDUCATION

Secondary education may be subdivided into two types: general and intermediate vocational (*sub-profesional*).

In the first category come the schools which continue the work of the primary schools and help to develop the personality of young people and adults, while at the same time providing proper vocational guidance during the 3 school years that make up this cycle. For those who wish to take up a professional career 2 more years of study are needed at an upper secondary school (*escuela preparatoria y vocacional*) so as to enable them to make a firm choice of a career at a university or polytechnical institute.

The general secondary schools are of three types: secondary, pre-vocational and university extension.

The intermediate vocational schools (*escuelas de segunda enseñanza subprofesionales*) continue primary education but give the pupils an opportunity of preparing themselves for employment as skilled workers, as tradesmen or as technical assistants in industry, commerce or agriculture. These schools are of three types: special, agricultural and technical.

General secondary schools

It is the secondary schools (*escuelas secundarias*) which absorb the bulk of the schoolchildren coming from the primary schools. They provide a well-defined and all-round course of instruction, enabling those who complete it to obtain a secondary education certificate, whether they wish to continue their studies or terminate them in order to enter employment.

The State provides this education free of charge to all persons without any limitation other than the quotas for each school.

The secondary schools are run according to two types of school calendar, 'A' and 'B', which are the same as for the rest of the country's educational system, and are based on climatic considerations. They each divide the school year into 2 terms of 5 months, with 2 holiday periods of 10 days, 1 in each term on completion of the courses, and 2 months' vacation before the next school year opens.

Under the 'A' calendar, the work of enrolment, classification of groups and special examinations takes place during the second fortnight of January, and under calendar 'B' during the second fortnight of August. In the first case, the classes start at the beginning of February and conclude at the end of November, and in the second they start at the beginning of September and conclude at the end of June.

The secondary schools have different time-tables for day classes and evening classes, depending on local requirements and the needs of the school population.

Some secondary day-schools work from 8 a.m. to 2 p.m., from Monday to Saturday, with 6 or 7 50-minute periods a day and a 10-minute break after each period, as well as a 20-minute recess to enable the children to have some light refreshment; the Saturdays are devoted to social activities or meetings of the pupils' clubs. Other day schools work from 8 a.m. to 12 noon and from 2 to 4 p.m., from Monday to Friday. The periods are of 50 minutes as a minimum, with a 10 minute break in between. Club activities are held one evening per week.

The secondary evening and night schools have a shorter time-table of 4 hours, from Monday to Friday, with 5 periods also of 50 minutes but without breaks. There are no workshop classes, since the pupils are young people or adults already employed in workshops or offices; nor are there any special sports lessons, because of the inconvenience of the time, although team matches are organized on Sundays. The time-table is from 4 to 8 p.m. for the evening schools and from 5.30 to 10 p.m. for the night schools.

Aims. The purpose of the *escuelas secundarias* is to produce young people with well developed personalities, capable of contributing to the general welfare of society; to inculcate desirable attitudes and standards of conduct; to impart a general culture; and to discover and guide the children's aspirations.

Curriculum. The secondary curriculum is characterized by (a) its uniformity, as evidenced by the common subjects

compulsory for all grades at all secondary schools, the period (3 years) normally allotted to it, and the total time devoted to each course; (b) its variability, as evidenced by the workshop subjects, which are taught in accordance with local requirements and the pupils' needs; and the club activities which enable pupils to use their leisure time in an organized manner; (c) its flexibility, as evidenced by the option of taking one of the subjects in the third grade for a course of two extra periods a week in addition to the normal course so as to help the pupils to discover where their vocational bent lies, and the exemption from workshop and sports activities of pupils who attend secondary night schools because they are at work during the day; and (d) its adaptability to the pupils' capacities as evidenced by the facilities provided to enable those who fail to pass in all their subjects in any school year to bring themselves to the proper level, and the arrangement whereby pupils failing to pass in four or more subjects can take them at their own schools under special conditions.

The curriculum provides for courses enabling the pupils to become acquainted with the elements that have contributed towards the culture, work and advancement of the Mexican nation, as well as those that make for the fulfilment of individual physical, health, social, aesthetic and recreational needs. It is characterized by the organization of related courses into integrated programmes, the content of which is presented in a cyclic pattern, e.g., arithmetic, algebra, geometry and trigonometry are integrated in the mathematics course and reappear in each of the three successive grades.

The subjects and activities are listed in the following table, together with the number of 50-minute periods allocated to each.

TIME-TABLE FOR SECONDARY SCHOOLS[1]
(in periods per week)

Subject	Year		
	1	2	3
Spanish language and literature	4	3	3
Mathematics	4	3	3
Biology	3	3	3
Physics	–	3	–
Chemistry	–	–	3
Geography	2	2	3
World history	2	2	–
Mexican history	–	2	2
Civics	2	2	2
English or French	3	2	2
Drawing	2	–	–
Technical drawing	–	2	–
Modelling	–	–	2
Music	2	1	1
Physical education	2	2	2
Workshop crafts or home economics	4	3	3
Option[2]	–	–	2
Total	30	30	31

1. Day schools. Pupils in night secondary schools are exempted from physical education and workshop crafts or home economics.
2. Two extra hours per week in any subject of the third year programme except geography, Mexican history, modelling, music, or physical education.

The content of the syllabuses is arranged as a series of 'units', each of which covers a central theme of interest to the pupils, and their general as well as particular objectives are clearly defined by the list of activities, which all contribute towards the development of the personality of the pupils, although the educational objectives are paramount.

Conditions for admission. Admission to secondary schools will become increasingly difficult, owing to the fact that the establishment of new schools is failing to keep pace with the annual growth of population, despite the considerable joint efforts being made by the authorities and the active elements in each local community.

In order to provide accommodation for the greatest possible number of pupils, the following types of secondary school have been established; all types keep to uniform standards as regards curriculum and teaching and differ only in the way in which they are financed:

Federal or state secondary schools. These are run by the authorities, and charge no fees. Where the number of would-be pupils exceeds the quota, selection tests are held.

Federal secondary schools with co-operative status. Private initiative, in the form of patronage committees or parents' associations, assists either with the cost of construction or, under special agreements, by paying fixed sums to cover staff salaries; but appointments to the staff are made on the nomination of the federal or state government and the principal and assistant principal are appointed by the federation. Education in this type of school may be free or subject to contributions within everyone's means.

Recognized private schools (*escuelas encorporadas*). These are run financially as business concerns and their entire costs are covered by monthly tuition fees paid by the parents. The teaching and directorial staff, and the school building, have to meet statutory requirements as the condition for operation. They are required to admit 5 per cent of their pupils free, on the basis of scholarship grants to those unable to find a place at the state schools, so that only a very small number of applicants are left without a school to attend.

All applicants for admission to secondary schools must have a primary education certificate, be under 15 years of age for secondary day schools and over 15 (or prove that they are employed) for secondary night schools, and pass selection and group classification tests.

Group classification in the first year is based on the level of preparation and age of the pupil; evaluation tests are being made in order to form groups which are as homogeneous as possible as regards both previous education and interests.

In the succeeding years, when the children are better known, they are grouped in accordance with their progress and their bent.

Achievement testing. The evaluation of the knowledge, habits, aptitudes, skills, attitudes and experience of the children, for diagnostic and promotion purposes, is effected on the basis of their work in and out of class, such as exercises, tasks, or research or documentation work set them by the

teacher, and of the results of the final examinations on a given subject or group of subjects, and of occasional tests during the year.

The marks obtained are recorded so as to give an idea of the pupil's progress, application and efforts to reach the monthly standard for the period in question. The scale of marks is from 1 'very poor' to 10 'excellent'.

Success or failure in each course or activity is evaluated separately.

Promotion. The secondary school tries to ensure that promotion is as rapid as possible, and therefore offers pupils the fullest possible facilities to complete their studies within the normal 3 years, but at the same time allows a longer time for those who fail to do so because of conditions of work or for other reasons. The length of time is, in fact, adapted as far as possible to the requirements of the individual pupil, thus ensuring that the educational purposes are at all times fulfilled.

The following examinations are conducted with that object in view:

1. Special semester examinations, for pupils who for justifiable reasons fail to sit for the ordinary semester examination, or for those who fail to attend the minimum number of classes for each course (60–80 per cent attendance). The examination covers the subject matter for the corresponding school period.
2. Special annual examinations, for pupils who fail to reach the final minimum pass standard. These examinations are conducted in two stages—before the beginning of the courses for the school year, and halfway through the year. They cover the subject matter for the two terms.
3. Proficiency examinations, for pupils who are not entitled to sit for the two above-mentioned examinations on account of their failure to put in the minimum attendance, or for those who are self-taught or have followed a different curriculum or syllabus. The examination covers the subject matter for the entire course and consists of practical and written tests.

Vocational and technical schools

The Instituto Politécnico Nacional is the state institution, attached to the Secretariat of Public Education, which provides technical education throughout the country.

Its chief functions are the following:

Planning, establishing, directing and supervising the national technical education system.

Providing and supervising technical education at its different levels throughout the country, and at the same time putting into practice the most modern educational and technical methods of teaching and research.

Establishing such schools, study centres and scientific research centres as it deems appropriate, in accordance with the methods best adapted to the aims of the institute.

Introducing, modifying or discontinuing courses, study plans and curricula in all schools and institutions included in the national technical education system.

Issuing study certificates, diplomas and degrees at different levels.

Ratifying, at its discretion, the equivalence of studies completed in schools or institutions outside the national technical education system.

Five types of education are provided by the Instituto Politécnico Nacional: pre-vocational, vocational, professional, post-graduate and training for skilled workers and foremen.

The following are institutions at secondary level.

Pre-vocational schools. These follow after the primary school and give a minimum of 3 years' training. Their aims are to provide pupils with a basic general education, to develop the pupils' manual dexterity and promote industrious habits by means of work in workshops and the study of technology, and to initiate vocational investigation. There is a single curriculum.

This study cycle leads to the Pre-vocational School Certificate, equivalent to the Secondary School Certificate.

Vocational schools. Entrance to these is from the pre-vocational school or the secondary school. The course occupies a minimum of 2 years, and corresponds to the *bachillerato* course in general schools. The aims are to raise the level of the student's general culture and to give specialized preparation for technical or professional studies. The curricula naturally vary according to the specific character of the individual schools, each course leading to the corresponding Vocational School Certificate or Diploma. Thus, for example, No. 1 Vocational School of Civil Engineering and Architecture, in Mexico City, awards the Certificate of Vocational Education in Civil Engineering and Architecture, which is required for admission to the Escuela Superior de Ingenieria y Arquitectura. Other types of vocational school are those for electrical and mechanical engineering, commerce and administration, economics, medical and biological sciences, chemical engineering, textiles. Either the Vocational School Certificate or the *bachillerato* admits to the higher professional schools which award the professional degrees of engineer, chemist, doctor, accountant, auditor, etc.

Training schools for skilled workers and foremen. These have the following aims: (a) to provide short courses for young people and workers who are, or desire to be, engaged on productive work, in order to confirm or improve their status as workers in a given branch of activity, or to transfer to a different branch; (b) to provide technical education below professional level (*enseñanza subprofesional*) so as to train technicians who will occupy intermediate posts in industry and serve as a link between the professionally trained engineers and the ordinary workers. Both types of course are planned within the context of the social and economic development of the country.

The requirements for admission for the short training courses are the primary school certificate or an ability test; and for the foremen's courses, the pre-vocational school certificate or the secondary school certificate.

Study in these schools leads to a certificate, in the case of the short training courses (e.g. skilled radio technician's certificate, skilled electrician's certificate, skilled mechanic's certificate, etc.), and to a diploma for the foremen's courses (e.g. diploma for the mechanical technician's course, the electrical technician's course, etc.).

Regional technical centres. These centres, which are attached to the National Polytechnical Institute, endeavour to meet regional requirements in technical education, and to promote and encourage commercial, industrial and agricultural development. They provide various study cycles, appropriate to the purposes for which they were created, including technical training for young people, courses for workers, re-education for adults, pre-vocational courses, vocational courses, professional courses and courses in industrial research.

Teacher training schools

The teacher training schools are responsible for the training of primary school teachers.

The teacher training system comprises federal teacher training schools, founded and supported by the federation; state teacher training schools, maintained by the governments of the individual states, and private teacher training schools, financed from private sources.

There are rural teacher training schools, and urban teacher training schools.

To solve the problem of the numerous unqualified primary school teachers who are working in rural areas, the Instituto Federal de Capacitación de Magisterio was established by the Law of 26 December 1944.

TRENDS AND PROBLEMS

Now that 33 years have elapsed since the *escuelas secundarias* were first set up, it can be stated that the principles which originally governed their establishment have retained with very little change their full validity in face of present-day needs and imperatives. On the other hand, a careful examination of the present position of secondary education shows that in practice there have been deviations from those objectives, aims and concepts.

In response to the necessity for reform and consequent reconstruction of the national educational system—a problem which has been receiving the active attention of the Public Education Secretariat—three essential documents have been issued analysing the present situation, namely:

1. Basic principles governing the national educational system, and objectives and requirements of curricula and syllabuses (study approved by the heads of the technical departments of the Directorates-General of the Public Education Secretariat and published by the National Technical Council of Education in March 1959).
2. Inaugural address by the Secretary for Public Education at the second plenary assembly of the National Technical Council of Education on 29 July 1959.
3. General Regulations governing the formulation of secondary school curricula and syllabuses, a study based on discussions at the National Conference for Secondary Education and submitted by the Directorate-General of Secondary Education for consideration and decision by the second plenary assembly of the National Technical Council for Education, which unanimously approved it on 31 July 1959.

Without undertaking a close examination of these important documents, it is sufficient to summarize the basic principles which—having regard to the various functional defects of secondary education—should inspire any new planning of education at that level. They are:

1. Principle of unity: secondary education should be planned on uniform lines throughout the country.
2. Principle of adaptation: secondary education should be planned to operate in a form adapted to the needs of secondary school children and of society.
3. Principle of efficiency: secondary education should be planned so as to meet the requirements of the all-round development of the personality of the pupil and also to make him reasonably proficient in an activity determined by his bent and by local requirements.
4. Principle of co-ordination: the planning of secondary education should ensure close co-ordination between the courses and activities, and between them and the aims and objectives of secondary education, with constant regard to the preceding and subsequent levels of education.
5. Principle of guidance: secondary education, in its planning and more especially in its programming and development, should fulfil the essential purpose of guiding the pupils.
6. Principle of economy: secondary education should be planned so as to achieve the maximum progress with the minimum waste of vital energy, in the interests of the physical and mental health of pupils.
7. Principle of training for citizenship: in secondary education, an important place should be given to training for citizenship, through constant attention to those of the pupils' activities which enable them to acquire proper attitudes to other people and habits of co-operation and social service.

It should be added that during the first year in office of Dr. Adolfo López Mateos, as President of the Republic, the Public Education Secretariat, on his express instructions and through the agency of Dr. Jaime Torres Bodet, the Secretary for Public Education, sponsored a far-reaching reform of school curricula and syllabuses at the pre-primary, primary, secondary and teacher training levels—a reform which is due to come into force in the immediate future and which sets a new course for public education in Mexico's continued efforts to develop and improve its public education system.

STATISTICS

Population (mid-year 1958 estimate): 32,348,000.
Area: 760,337 square miles; 1,969,269 square kilometres.
Population density: 43 per square mile; 16 per square kilometre.

Summary of school statistics, 1953–57. In 1957 total enrolment at all levels of education reached nearly 4.5 million pupils, or 14 per cent of the total population. About 4 per cent of the pupils were attending kindergartens, 88 per cent were in primary schools, almost 3 per cent in the junior and senior secondary schools together, less than 2 per cent in vocational schools, less than 1 per cent in teacher training schools, and slightly over 2 per cent in universities and colleges. As to the proportion of girls enrolled, data available for the latest years relate to general secondary schools (33 per cent girls in 1956), vocational schools (48 per cent girls in 1956), teacher training schools (61 per cent girls in 1956), and universities and colleges (28 per cent girls in 1957). For earlier years, the proportion of girls enrolled in primary schools was reported to be about 65 per cent (see *World Survey of Education: II-Primary Education*).

Between 1953 and 1957 primary school enrolment increased by 26 per cent, and the teaching staff increased by 33 per cent. Average number of pupils per teacher in primary schools was 38 in 1957 as compared with 40 in 1953. (See Table 1.)

Enrolment trends in secondary education, 1949–57. Table 2 shows that total enrolment in general and vocational secondary education more than doubled in the period of 9 years; in teacher training it more than tripled. Thus the average total enrolment for the period 1955–57 was more than twice as high as in 1949 and represented about 7 per cent of the estimated population 15–19 years old.

Examination results in secondary education, 1953–56. Complete data on examination results are not available. The number of teaching certificates granted each year from 1953 to 1956 were as follows: kindergarten teachers, 67 (1953), 86 (1954), 97 (1955), 133 (1956); rural school teachers, 7 (1953), 34 (1954); *profesor de instrucción primaria superior*, 1,603 (1953), 2,494 (1954), 2,729 (1955), 2,309 (1956).

Educational finance, 1959. According to data published by the Unesco Regional Office for the Western Hemisphere in the *Boletin trimestral de Proyecto Principal de Educación Unesco-América Latina*, Vol. 2, No. 5 (January–March 1960), the 1959 budget estimate of the Ministry of Education amounted to 1,482,480,000 pesos, an average expenditure of 44.5 pesos per inhabitant. An amount of 555 million pesos, about 37 per cent of the total budget, was allotted to primary education. Official exchange rate: 100 pesos = 8 U.S. dollars.

MONACO

THE EDUCATIONAL SYSTEM

Public education comes under the Government Councillor for the Interior. An Education Committee composed of 12 members appointed for three years by HRH the Prince Regnant is responsible for the supervision, control and promotion of both primary and secondary education.

Two school inspectors, appointed for a term of three years by the Prince Regnant, are responsible for the standard of teaching given in the various schools, for ensuring that administrative instructions are carried out, and for recommending measures for any reforms and improvements which may seem to them necessary.

The State bears all costs of public education, including the construction, equipment and maintenance of all state schools, and defrays their running costs, including the purchase and renewal of supplies for classical and scientific education.

Teachers, whether seconded from France or not, are remunerated by the State of Monaco in accordance with the rates of pay prevailing in France. However, a special bonus is paid to teachers who are *agrégés*, so as to attract and retain the most highly qualified staff.

A school medical inspection service, set up in 1950, is responsible for supervising the health of pupils and staff in public and private schools.

The structure of the school system is similar to that of France.

THE DEVELOPMENT OF SECONDARY EDUCATION

The principal laws governing secondary education are the following:

Sovereign Decree of 25 September 1910, founding the Monaco *lycée*.

Sovereign Decree of 30 January 1919, instituting a secondary education course for girls.

Law No. 250 of 24 July 1938, instituting free secondary education for pupils who are nationals of Monaco.

Sovereign Decree No. 2197 of 8 September 1938, laying down the conditions for admission to the *lycée* and to the girls' secondary school.

Sovereign Decrees No. 1649 of 30 October 1934 and No. 1373 of 1 August 1956, founding the Académie de Musique Rainier III, and Departmental Order of 11 October 1934, providing regulations for the running of that institution.

TYPES OF SECONDARY EDUCATION

Owing to the smallness of its territory and its tiny population, the Principality of Monaco has only one general secondary school, the *lycée*, which prepares pupils for the two parts of the secondary leaving certificate, or *baccalauréat*. The course lasts 7 years and is free for Monaco nationals, a very small charge being made to foreigners. Curricula are identical with those in France but with the addition of the history of Monaco and religious instruction. The staff is composed mostly of qualified secondary teachers (*agrégés* and *certifiés*) seconded from France.

The examining authority for the Monaco *lycée* is the *Académie* of Aix-en-Provence.

The passing of the *baccalauréat* at the end of the secondary school course qualifies students for entrance to universities in France—and sometimes elsewhere—for whatever higher studies they may wish to pursue.

For training in music and the arts the Principality of Monaco has a School of Design and Decorative Art and a School of Music (the Académie Rainier III) which has many classes for vocal and instrumental music where the teaching is given by soloists of the National Orchestra of the Monte Carlo Opera who are *premiers prix de Conservatoire.*

TRENDS AND PROBLEMS

Owing to the country's special situation, developments in secondary school curricula and teaching methods in the Principality of Monaco are closely linked with those in France.

[*Text prepared by the Monaco National Commission for Unesco in November 1959.*]

STATISTICS

Population (mid-year 1958 estimate): 21,000.
Area: 0.4 square miles; 1 square kilometre.

Summary of school statistics, 1953–57. In 1957/58 enrolment in 6 public primary and one public general secondary school was 2,563 pupils, of whom 45 per cent were girls, representing some 13 per cent of the total population. There were, in addition, about 200 pupils at a private secondary school. Enrolment in commercial, vocational and domestic science courses numbered 158 pupils in 1958/59. Compared with 1953/54, the number of teaching staff in public primary and secondary schools was unchanged at 132, of whom three-quarters were women. The pupil-teacher ratio in public primary schools was 20 and in the public *lycée* 18. Enrolment in public schools had increased by 12 per cent over 1953/54. (See Table 3.)

Enrolment trends in secondary education, 1930–57. Enrolment in the public *lycée* increased by 123 per cent over this period. The ratio of enrolment to the estimated age group 15 to 19 years old rose from 33 in the 5 years 1930–34 to 80 in the 3 years 1955–57. (See Table 2.)

Examination results in secondary education, 1953–57. The number of students passing the second part of the *Baccalauréat* increased from 25 to 37, including 17 girls, in the 5 years under review.

Educational finance, 1957. Total recurring expenditure on education was 141 million French francs in 1957 (fiscal year beginning January). (See Table 1.)

2. Public school only.

MONGOLIAN PEOPLE'S REPUBLIC

THE EDUCATIONAL SYSTEM

Before the revolution in 1921, Lama monasteries were the main educational institutions in the country, and only one secular school existed. Shortly after the revolution the Government took steps to set up primary schools and in 1923 the first literacy campaign was launched. In the following year, the Mongolian People's Republic was proclaimed and a Ministry of Education was established. In addition to government-supported schools, there were a number of voluntary schools organized and financed by the people themselves. As the majority of the people were nomads, special attention was given to the setting up of boarding schools.

In 1940, following the political unification of the country, a single unified school system was introduced, marking the beginning of a vigorous extension of public education. The reform of the alphabet took place in 1941, when Cyrillic letters replaced the ancient characters, and in 1942 compulsory education was introduced.

Article 90 of the Constitution of 1952 proclaims the right of all citizens to education. The enjoyment of this right is ensured by the provision of compulsory general primary education, the development of a network of schools and institutions of secondary and higher education, the use of the pupils' mother tongue as the medium of instruction, the system of state scholarships for students in institutions of higher and specialized secondary education, and by the free vocational training of workers.

The educational system is entirely secular and there is no discrimination or privilege affecting entry to schools. Girls have the same educational rights as boys. Kazakh pupils go to schools in which they are taught in their own language.

The Ministry of Education exercises general control over the whole educational system. In each of the 18 *aimak* (provinces) into which the country is divided, there is a Department of Public Education responsible to the Provincial Government for education in the area.

The financing of public education is borne by the *aimak* authorities, for schools under their jurisdiction, and by the Central Government.

The educational ladder begins with a kindergarten which admits children from the age of 3. The primary school has a 4-year course and is followed by the 3-year incomplete secondary school. This leads to a further 3-year course in the upper classes of the complete secondary school or specialized (vocational and technical) secondary education. Institutions at the higher level include the State University at Ulan-Bator, founded in 1942.

TYPES OF SECONDARY EDUCATION

The aim of the general education course is to produce good citizens by cultivating in each child a consciousness of civic duty, a love of country and humanity, and an interest in work and in socialism. The curriculum for the secondary classes (fifth to tenth years of the general course) includes Mongolian language and literature, arithmetic, algebra, geometry, trigonometry, astronomy, chemistry, physics, zoology, botany, history and constitution of the Mongolian People's Republic, history of the Union of Soviet Socialist Republics, geography, Russian, a second modern language, practical work, drawing, technical drawing, singing and physical education. Latterly, great importance has been attached to polytechnical education and production training has been introduced into all secondary schools. Every school has well equipped workshops and ground for practical work in agriculture. Pupils are taken to state factories and enterprises to study production.

Secondary school teachers are trained at the Pedagogical Institute (at higher education level) and at the State University.

Vocational and technical schools at secondary level include 'technicums', vocational training schools, and teacher training schools for primary teachers.

[*Text prepared by the Unesco Secretariat in July 1960.*]

STATISTICS

Population (mid-year 1958 estimate): 1,040,000.
Area: 591,000 square miles; 1,531,000 square kilometres.
Population density: 1.8 per square mile; 0.7 per square kilometre.

Summary of school statistics, 1956. Available data are very incomplete and cannot be summarized in tables. In 1956, there were 78 nursery schools enrolling approximately 4,000 children, and 432 primary and secondary schools with 91,000 pupils. Of the latter group of schools, 349 were 4-year elementary schools, 52 were 7-year schools and 31 secondary schools. About 5,000 pupils were enrolled in 15 vocational and teacher training institutions. There were 4 higher educational institutions with a total enrolment of 3,200 students. In all, some 263,000 pupils were enrolled in educational institutions at all levels in 1956, representing about a quarter of the total estimated population. The total teaching staff numbered approximately 3,500 in 1956.

MOROCCO

THE EDUCATIONAL SYSTEM

Following independence, the Moroccan Government inherited a complex educational system which had been set up under the Protectorate for purposes that no longer concorded with the changed circumstances, and which had been moulded by a number of diverse ethnic, linguistic, social, cultural, religious and economic factors. For example, the coexistence of different ethnic and religious communities led to the establishment of both Franco-Muslim and Franco-Jewish schools, and also of schools coming under the Alliance Israélite Universelle (AIU) but subject to educational control by the Ministry of Education, and receiving the subvention necessary for their operation. Similarly, language differences have also had their impact on education: Spanish has been the language of instruction in the northern area, and French in the rest of the country.

Under the Protectorate, schooling was mainly the preserve of the children of French officials and the upper strata of Moroccan society, so that education acquired an urban impress and primary education developed more rapidly in the towns than in the countryside. The existence of this 'field of recruitment' has led to the opening in Rabat, Casablanca, Fez, Meknès, Marrakesh and Agadir of large general and technical secondary schools.

These centres, which are provided with well-equipped boarding facilities, are capable of accommodating large numbers of children thanks to a system of scholarships, and thus provide the means for training the higher staff of which Morocco stands in need. The creation of 1,867 new scholarships for general secondary education, has brought the total number now awarded up to 6,318 and the appropriations required to 220,000 NF. For technical education, the number of scholarships awarded is 3,849 while for Muslim education there are 2,119.

Since it became independent, Morocco has shown a wish to return to the deep-rooted traditions of Islam and of Arab civilization, and for that purpose to establish contact with the Eastern world. North Africa has always been a bridge between East and West; hence the aim of Moroccan education must be to form a specifically Moroccan individuality composed of elements drawn from the two sources of Eastern and Western civilization. In addition, the special characteristic of Islam is that it is intimately linked with Arab culture. The educational objective must therefore be to maintain the bonds between religion and education intact.

Finally, the importance of economic factors must be stressed: the country's needs demand the opening of certain schools, an engineering school, for example, which will come into operation in October 1960. These requirements cover higher-grade staff—mechanical, electrical, chemical and civil engineers and architects; middle-grade staff (holders of industrial or commercial secondary school certificates) (*brevets*); and skilled workers. Indeed it may be said that ethnic, linguistic, cultural and religious factors are losing their importance while the social and economic factors are becoming predominant.

The public authorities naturally take the lead at all administrative levels in providing educational facilities. At the local level, the regional inspectorates study demand and supply as regards premises, teaching staff and school recruitment. The information is collected by the provincial authorities and channelled towards the Central Government, i.e., the Ministries of Education, National Economy, Agriculture and Public Works, at which level the authorities concerned, once all the information is at their disposal, formulate a policy for establishing schools in accordance with national priorities.

The public authorities are assisted in their work by private bodies such as the advanced training boards (one for each school); the patronage committees, whose aim is to give technical education material and moral support in each locality; and the National Association for the Development of Vocational Training, which is now emerging from a period of somnolence. The Government also receives valuable assistance from the chambers of commerce and industry, the Chambres Syndicales du Patronat, the Comité des Industriels, the Association des 'Jeunes Patrons' and old pupils' associations, all of which draw members from every walk of life and are able at all times to keep the authorities alive to the needs and potentialities of the labour market.

Moroccan education today takes the following forms:

Modern state education. This comprises three levels and is provided in schools set up by the Ministry of Education and the French Mission Universitaire Culturelle. It is heir to the French system established under the Protectorate.

The secondary level is open to children who, over a period of 5 years of primary education, have acquired the necessary foundation for continuing general or technical education. At the end of the 7-year secondary course, pupils sit for the French general or technical *baccalauréat.*

On leaving a *lycée* or *collège* the young Moroccan has a fair knowledge of French and a reasonably wide background of Western type. However, his knowledge of Arabic is inadequate and he is likely to abandon traditional concepts whose worth has been proved over the ages.

Islamic education. This also comprises three levels and is a form of state education. It is provided in Koranic schools, *medersas* and universities, of which the most famous is the Karawiyīn University at Fez. Secondary schooling covers 6 years and is followed by a higher course (3 years) of literary and legal studies. At the end of the 9 years pupils may obtain a certificate—the *'Ālemiya.* The young Moroccan who completes this course has a very good knowledge of Arabic and the Islamic sciences, is fairly well abreast of Western thought and often eager to tackle the new problems of our time.

To complete this rather scholastic education and counteract the competition of the French *baccalauréat,* which until now has been the gateway to higher education and hence to many public posts, Rabat University is offering modern courses leading to a Moroccan *licence* (arts or law).

Muslim private education. This was established under the Protectorate to withstand the invasion of French in all disciplines and to provide schooling for children who could not attend the Protectorate schools. All subjects are taught in Arabic and adapted to local conditions. However, French is regarded as the second language. The secondary course covers 7 years and leads to the Moroccan *baccalauréat* (first and second parts).

The principals of private schools receive a government subsidy which defrays almost half the costs of the school (mainly salaries).

Jewish private education. Provided by the Alliance Israélite Universelle, this is available in principle to Moroccan Jews. It is similar to that given in French schools. A few hours are devoted to the teaching of Hebrew, and in recent years an effort has been made to extend the teaching of Arabic, which had been rather neglected.

European private education. This comprises both denominational and secular schools and is restricted mainly to the primary level. There are only a few secondary classes.

The Moroccan educational system is governed by a number of laws and regulations introduced over the past forty years. The *Dahir* of 26 July 1920 instituted a Directorate of Education, while the general organization of the educational service was dealt with in the *Dahirs* of 17 December 1920, 8 March 1921, 30 August 1926 and 28 September 1940.

When Morocco formed its first independent Government (7 December 1955) the Directorate of Education and Fine Arts became the Ministry of Education, Youth Activities and Sports (October 1956). Other very important reforms followed. Some were aimed at endowing the country with permanent institutions whose role it would be to advise the Ministry at the higher level, to work out an appropriate policy for education and culture and to ensure a certain continuity in its application. Thus a Higher Council of Education and a National Council of Popular Culture were set up. The Higher Council of Education (*Dahir* No. 1-59-121 of 1 June 1959) is consulted on proposed reforms affecting the various types of education; it gives its opinion on all questions of national import affecting

education and training, whatever ministerial department they may concern. The National Council of Popular Culture (*Dahir* No. 1-59-140 of 1 June 1959) advises the Government on all questions of out-of-school education and cultural activities.

Other reforms have dealt with the structure and internal organization of educational services with a view to bringing the administration into line with the country's new needs and resources. The *Dahir* of 9 February 1959 outlines the organization of the Ministry of Education and a ministerial decree implements it by defining the structure and duties of the different services.

The diagram on page 837 shows the structure of the Moroccan educational system.

THE DEVELOPMENT OF SECONDARY EDUCATION

Secondary education, in the sense of education for adolescents, existed before the establishment of the French Protectorate over Morocco in 1912. Available to pupils who had been educated in the Koranic schools, it was given in the mosques, the most famous of which was the Karawiyīn University at Fez.

The teaching was almost entirely religious (theology, religious sciences, Muslim law and the grammar necessary for reading texts). It led on to higher Islamic education—also given in the mosques—which was designed to train jurists, scholars and theologians. This education still exists.

In the early days of the Protectorate European secondary schools in conformity with the French educational system were opened at Tangier (1909) and at Casablanca (1914) for boys and also at Casablanca (1915) for girls. As time went on *lycées* and *collèges* sprang up in the big centres to meet the needs of the growing French and other European population. The French curriculum was strictly applied so that pupils could transfer easily to or from schools in France. European schools were open to Moroccans and Europeans alike, under the same conditions regarding age and ability qualifications.

Alongside these European schools secondary schools specially designed for Muslim Moroccans were set up at Rabat and Fez from 1915 on, and these Muslim *collèges* became public schools in 1920, with the institution of a Muslim Education Service within the Directorate of Education. Special curricula were drawn up, largely on the lines of the European secondary school curriculum, but including a few hours of Arabic. However, despite the important place occupied by Arabic, the Koran and Islamic disciplines, the teaching of Arabic remained inadequate. Teachers were French or Moroccan according to the subject taught.

After 1930 the increase in the school population made it necessary to open further secondary schools in various regions, and boarding facilities were added in a number of schools. The curricula and examinations applying to Muslim secondary education were successively modified. By 1956, the examinations comprised the lower secondary certificate (*brevet d'études du premier cycle*), common to European and Muslim schools, the Muslim secondary school certificate and the *baccalauréat*.

At that time there were seven Muslim secondary schools, some of which extended only to the end of the first cycle (classes 6 to 3), others went as far as the second or first class. (The numbering of secondary classes follows an inverse order—see diagram.) In order to obtain the second part of the *baccalauréat* pupils had to go to a European school for the final year or years.

The advent of independence was to lead to important policy changes in secondary education. Some European schools were taken over by the French Mission Universitaire et Culturelle in Morocco, while others remained under the authority of the Ministry of Education. In 1956 the Muslim Secondary Education Service became an autonomous service distinct from that of primary education and secondary schools without the two final classes were extended to include them. Complementary schools (primary continuation schools) became *collèges* offering the first cycle (first 4 years) of the secondary course, new schools were founded, and secondary education for girls quickly developed. To the girls' *collèges* set up at Rabat (in 1945) and at Fez (in 1947) were added first-cycle *collèges* and also a *collège* at Meknès (in 1958).

In 1957, under King Mohammed V, a commission was appointed to draw up a reform of secondary education, aimed at the gradual 'Moroccanization' of education and the unification of time-tables and curricula. The new curricula came into force in October 1957, and a secondary teacher training school was opened to train teachers to educate pupils in the spirit of the reform.

In October 1958 the Secondary Education Division was formed, combining the Muslim Secondary Education Service with the European Education Service, which until then had been autonomous. At the same time, an Educational Research Centre was set up with the help of secondary school teachers and inspectors to assist the Ministry of Education.

At present there are 54 secondary schools of the European or Moroccan type, which, thanks to their flexible curricula, provide a good education perfectly suited to a school population of diverse origin.

Technical education, too, was introduced in Morocco at an early stage, the necessity of training qualified staff for industry and commerce leading to the foundation, in 1917, of the Casablanca industrial and commercial school, now a purely industrial school. Another development was the opening of technical sections annexed to some of the general secondary schools (Collège des Orangers, Rabat, Collège de Mers Sultan, Casablanca, Collège de Kénitra). However, it was not until October 1945 that technical education was properly planned and organized.

Until independence secondary education was governed by French provisions with the modifications imposed by local conditions. But Morocco had no law or regulation making school attendance compulsory.

Administration

In pursuance of Article 2 of the *Dahir* of 9 February 1959, the Ministry of Education comprises a general secretariat, a general administrative service and five divisions: Primary Education, Secondary Education, Technical Education, Higher Education, Youth Activities and Sports.

In so far as secondary education is concerned, laws and regulations are drawn up by the head of the division in question. In matters of teaching he is assisted by the Higher Council of Education and the Educational Research Centre. In close liaison with the head of division, this centre works out curricula suited to the peculiar conditions of the country and of modern life, advocates teaching methods, approves textbooks, etc. The resultant policy is submitted by the Minister of Education to the Cabinet before it is implemented. The head of division is further assisted by provisional bodies—particularly by commissions composed of Moroccan personalities, inspectors and specialized teachers.

The principals of general schools come directly under the authority of the central administration. There is no decentralization: secondary schools (with the exception of technical schools) are not answerable to any other public administration and have no administrative connexion with private bodies.

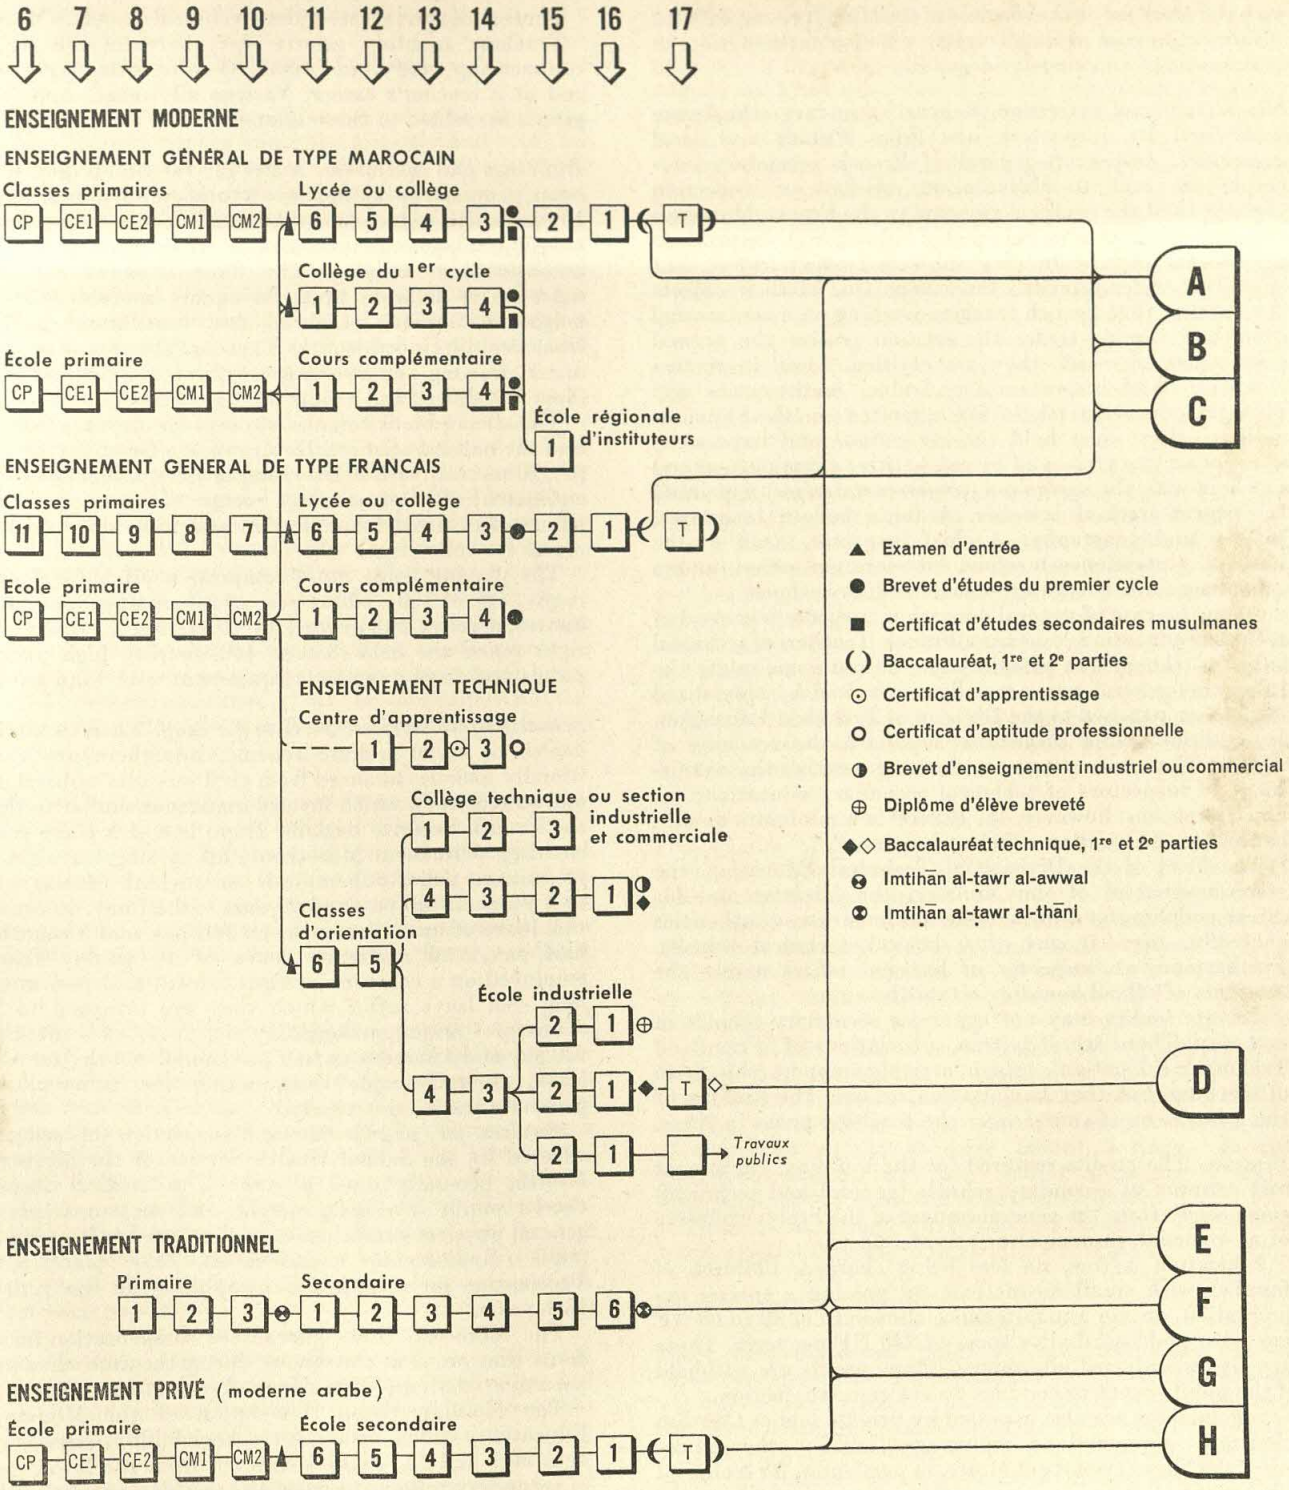
In the case of technical education its organization is jointly studied, drafted and reviewed by the services of the Ministry, the Division of Technical Education and the Research Centre. The Division of Technical Education is under the control of the Minister of Education. The Head of Division is assisted by a head of service and various specialized inspectors (industrial education, commercial education, agricultural education, domestic science, fine arts). He has at his disposal an administrative service with several departments dealing respectively with teaching staff, finance, building plans, school equipment. These services are in direct contact with schools which come under the Technical Education Division, but liaison with multipurpose schools is maintained through the Division of Secondary Education.

Some schools come under several ministries: Education and Public Works (special schools for training Public Works staff), Education and Agriculture (Meknès College of Agriculture), Education and Labour and Social Welfare (vocational training school).

The chambers of commerce and industry and other private bodies mentioned above are in contact with the Technical Education Division in many different ways, such as direct contacts between principals of schools and members of the division, written or verbal communications

GLOSSARY

NOTE. For secondary classes in *lycées* and *collèges* the diagram shows the inverse order of numbering which is usual in these institutions, the secondary level beginning at the 6th class and progressing to the 1st, with a terminal class T. The usual names of the primary classes are *cours préparatoire* (CP), *cours élémentaire, 1 et 2* (CE.1 and CE.2) and *cours moyen, 1 et 2* (CM.1 and CM.2).



centre d'apprentissage: vocational training school for apprentices.
classes primaires: primary classes attached to a *lycée* or *collège.*
classes d'orientation (direction-finding classes): first 2 years in a *collège technique* or the *École Industrielle.*
collège: general secondary school.
collège du 1er cycle: lower general secondary school.
collège technique: vocational (technical) secondary school.
cours complémentaire: extended primary course with lower secondary curriculum.
École Industrielle: vocational secondary school with industrial and technical courses and a course preparing for entry to employment in Public Works Department (*Travaux publics*).
école primaire: primary school.
école régionale d'instituteurs: regional teacher training school.
enseignement général de type français: general education modelled on that provided in corresponding types of school in France.
enseignement général de type marocain: general education of Moroccan type.
enseignement moderne: education which is 'modern' in the sense that the curriculum emphasizes general, secular subjects as contrasted with the 'traditional' schools (see *enseignement traditionnel*).
enseignement privé (*moderne arabe*): private education with the 'modern Arabic' type of course.
enseignement technique: vocational and technical education.
enseignement traditionnel: traditional type of education, emphasizing classical Islamic studies.
lycée: general secondary school.
section industrielle et commerciale: industrial and commercial section attached to a *lycée* or *collège.*
travaux publics: see *École Industrielle:*

HIGHER EDUCATION

A. Institutions preparing for a Moroccan *licence.*
B. Institutions in Morocco or France preparing for a French *licence.*
C. Courses preparing for entrance examinations to the higher professional schools (*grandes écoles*) in France.
D. School of Engineers (Morocco).
E. Third cycle of traditional Islamic education; there are 2 courses, literature and law, each leading in 3 years to the al-'Ālemiya certificate.
F. School of Administration (Morocco).
G. Universities in the Middle East.
H. Secondary Teacher Training Institute.

EXAMINATIONS

baccalauréat, 1re et 2e parties: first and second parts of the *baccalauréat*, the basic qualification for university entrance.
baccalauréat technique, 1re et 2e parties: first and second parts of the technical *baccalauréat*, qualifying for engineering and technical education at higher level.
brevet d'études du premier cycle: lower secondary certificate, taken at the end of the first cycle (fourth year) of general secondary course.
brevet d'enseignement industriel ou commercial: vocational secondary certificate of industrial or commercial studies.
certificat d'apprentissage: apprenticeship certificate.
certificat d'aptitude professionnelle: vocational proficiency certificate.
certificat d'études secondaires musulmanes: lower secondary certificate for Moroccan type of course.
diplôme d'élève breveté (*industriel*): industrial technician's diploma.
examen d'entrée en sixième: secondary school entrance examination.
imtiḥān al ṭawr al-awwal: certificate of 1st level (primary) studies in traditional schools.
imtiḥān al ṭawr al-thāni: certificate of 2nd level (secondary) studies in traditional schools.

with the Minister or the services of the Ministry, suggestions, wishes expressed through trade unions, participation in examinations and prize-givings, etc.

Supervision and inspection. General secondary schools are supervised by inspectors sent from France and local inspectors. Inspectors-general of French secondary education are sent to Morocco on missions of inspection (Article 14 of the protocol annexed to the Franco-Moroccan cultural convention initialled on 30 May 1957). Inspections are annual for the literary subjects (*section lettres*), but spaced at wider intervals for others. One of their objects is to ensure that French teachers working on a contractual basis and coming under the mission receive the normal promotions to which they are entitled. Local inspectors comprise chief inspectors for Arabic, mathematics and physical education (these are recruited on their qualifications—they must hold the *agrégation*[1] and have some years of service etc.—and by competitive examination) and teachers with the *agrégation* (*professeurs agrégés*) appointed to inspect natural sciences, Arabic, modern languages, history and geography. A chief inspector, head of the bursars' (intendances) school co-operation office, audits school accounts (boarding schools and day schools).

As in the case of general education, inspectors-general of technical education come from France. Teachers of technical subjects (theory and practice) who do not come under the inspectors-general are normally supervised by specialized inspectors attached to the Division of Technical Education. In addition, chief inspectors supervise the teaching of Arabic. There is as yet no legislation governing the recruitment of inspectors of technical secondary education; for non-Moroccans, however, the *licence*[1] is a minimum qualification for the position of 'chief inspector'.

The head of the Division of Technical Education, the secretary-general of the Ministry, the Minister and his direct collaborators, in fact the administrative authorities generally, may at any time inspect technical schools. Furthermore an inspector of bursars' offices audits the accounts of school boarding establishments.

Private bodies may not supervise secondary schools in any way. There are, it is true, associations of 'Friends of Technical Education', which actively support this form of teaching, but they have no control over the running of the schools, or of course over the teaching given in them.

Finance. The credits required for the building, equipment and running of secondary schools (general and technical) come solely from the general budget of the State, exclusive of all regional, municipal or private aid.

Education is free, no fees being charged. Children of families with small means can, on passing a special examination, obtain a maintenance allowance of 30 to 60 NF per term and board allowances of 240 NF per term. There are also semi-board allowances. These grants are withheld if the pupil's work or conduct do not give satisfaction.

Scholarships are also awarded by private bodies (Muslim charitable organizations, orphanages) and by other ministries (the Ministry of Agriculture, in particular, for technical education).

There are no private secondary technical schools in Morocco.

Teachers' monthly salaries vary between 630 NF, the commencing salary, and 1,538 NF, the salary paid at the end of a teacher's career. Various allowances and family grants are added to these salaries.

Buildings and equipment. A site for the building of a *lycée* must, generally speaking, have a total area of approximately 10 acres. Allowance must be made for a day school, a boarding school, administrative services, playing fields and administrative housing. The dimensions of classrooms must be as follows: area, 56 square metres (8.5 × 6.5); height, 3.25 metres. Lighting and ventilation should be from two sides (north-south). There are also special rooms for music, drawing, history and geography (equipped for showing films and slides), and a room for maps and collections.

The science block comprises rooms for physics, chemistry and the natural sciences, lecture rooms for about 40 pupils (8 × 10 metres) with desks rising in tiers, a blackboard and equipment for projection, rooms for practical work, laboratories fitted for collective and individual work and rooms for collections.

The playing fields must comprise a pitch for football, rugby, etc. of 100 × 60 metres, a basketball ground 26 × 14 metres, a volley-ball ground 18 × 9 metres, a running track right round the field (350 to 400 metres), high and long jumps and fixed gymnastic equipment with sand beneath.

School welfare services. Services for staff. There is no state health or social welfare scheme, but there are various friendly societies financed from civil servants' subscriptions and state grants, which furnish assistance similar to that of the French Securité Sociale. There is a sick-leave scheme entitling permanent Moroccan staff to long leave (in case of cancer, polio, tuberculosis or mental illness) of up to 3 years on full pay and 2 years on half pay, to ordinary sick leave of up to 3 months on full pay and 3 months on half pay, and maternity leave of 10 weeks. Teachers employed on a contractual basis are entitled to 6 months' long sick leave (after which they are returned to their country of origin), to ordinary sick leave of 3 months on full pay and 3 months on half pay, and 2 months' maternity leave. A radioscopic examination for tuberculosis is generally carried out yearly.

Services for pupils. Medical inspection of schools is effected by the School Health Service of the Ministry of Health, generally once a year. The medical inspector checks pupils' eyesight, weight and measurements and general physical condition. A medical card is kept for each pupil. Radioscopic examinations take place yearly. Vaccination for smallpox is compulsory in the 12th and 18th years.

The Moroccan State guarantees compensation for accidents that occur at the schools during the time when pupils are under the care of teachers. Accident insurance is free.

The Holiday Camp Association of the Ministry of Education, which caters for schoolchildren between the ages of 7 and 14, enables children from the lower grades of secondary schools to go to the seaside or the mountains during the long vacation. Funds come from state subsidies and donations, from collections and school fêtes, as also from parents' contributions.

1. For an explanation of the terms *agrégation* and *licence*, see chapter on France. The Moroccan *licence* is patterned on the French equivalent.

TYPES OF SECONDARY EDUCATION

State education is of the following four types:

General secondary education. This is given in the full-time secondary schools coming under the Ministry and is of two types: (a) *Moroccan national education.* Mention has already been made of the educational reform of 1957, and the trend towards 'Moroccanization' and unification of curricula, syllabuses and time-tables in all sectors of education. At present the teaching is bilingual (Arabic and French or Spanish), French or Spanish being used for the teaching of special subjects. A second modern language is also taught—English, French or Spanish—but Latin and Greek are not included in the curriculum.

Since the reform the course has been of 6 years' duration, comprising two cycles of 3 years each. The first cycle, which is the same for all pupils, is devoted to general education, with the possibility of branching off into technical subjects in the first year. The second cycle is specialized and comprises five sections with a literary or scientific slant. The first cycle leads to the *brevet d'études du premier cycle* or the certificate of Moroccan secondary education (*certificat d'études secondaires marocaines*), and the second cycle to the Moroccan *baccalauréat.* But pupils can also prepare for the French *baccalauréat* (7-year course), modern section (philosophy, elementary mathematics, experimental sciences). (b) *French education.* This is identical with the secondary education given in France with the addition of the rudiments of Arabic.

Islamic education. Following on from Islamic primary education, this course is for children of about 12 years of age. The curriculum includes both general education and Islamic disciplines (Muslim law and theology), all of which is taught in Arabic. It is a 6-year course, divided into two cycles, the first being devoted to general education, the second allowing for specialization with literary, scientific and theological and legal sections.

Technical education. On completing their primary education pupils may enter schools for apprentices *(centres d'apprentissage)*, technical secondary schools (*collèges techniques*) or the national vocational school (*école national professionnelle*) as long as they comply with the age qualifications. A school and vocational guidance service within the Division of Technical Education is available to pupils and parents. This service, by means of knowledge and aptitude tests, organizes standardized entrance examinations for the apprentices' schools. During the first year of the secondary course, which is particularly important, it keeps in constant contact with pupils.

Extended primary course. This consists of 2 years following on from the primary school. It provides further general education and prepares pupils for various careers—subordinate posts in the civil service, clerical positions, etc.

In the private schools curricula are similar to those of the state schools, but all subjects are taught in Arabic. French is learnt as a modern language.

On completing their general secondary education (Moroccan or French), pupils with the *baccalauréat* may enter universities in Morocco (faculties of law, arts and science), in France, and also in other countries on certain conditions. They may also sit for the competitive entrance examinations to the *grandes écoles* in France (École Polytechnique, École Centrale) as privileged foreigners. With the *baccalauréat* they are automatically accepted in certain French technical institutions for the training of veterinary surgeons, engineers, agronomists, etc. Finally, during their secondary schooling and without the *baccalauréat*, they may enter regional teacher training schools (1-year course), without passing a competitive examination, or the Moroccan school of administration (two sections, Arab and French), on passing a competitive examination. (Candidates with the *baccalauréat* do not have to sit for this examination.) The above schools are restricted to Moroccans.

Pupils who have completed their technical secondary education find many openings. They may continue their studies at the higher level (a) in schools of engineering, at the higher training school for technical teachers or the merchant navy school, if they have the technical *baccalauréat* or if they have gone through the vocational teacher training school section; (b) at the Cap Matifon vocational teacher training school or at the Air Force and Navy School at Rochefort, France; (c) at the Institute of Commerce at the University of Grenoble, at the High Schools of Commerce or at the higher training school for technical teachers, after a probationary period at the Rue Abbeville Collège in Paris, if they hold the higher teaching certificate in commerce; and (d) at the Meknès School of Practical Agriculture if they hold the teacher's certificate in agriculture.

Organization of the school year. The schools reassemble on 1 October. The summer holidays run from 30 June (15 June in the hottest parts of the country) to 30 September. The school year is divided into three terms (October to December, January to March, and April to June).

Fixed holidays common to all schools are as follows: the holidays at the end of the first term (23 December to 2 January), All Saints Day (1 November), the royal national holiday (16, 17 and 18 November), Labour Day (1 May) and the holiday at the end of the second term (20 March to 1 April). In the Moroccan schools the mobile holidays are al-'Eīd al-Ṣaghīr (about 3 days), Ascension day (1 day) and al-'Eīd al-Kabīr (about 4 days). In the European schools they are al-'Eīd al-Ṣaghīr (1 day), Ascension day (1 day) and Whitsun (2 days).

There is no school on Friday or Sunday. The school hours are from 8 a.m. to noon and 2 to 5 p.m.

General secondary schools

From the educational point of view, secondary schools under the Ministry of Education belong to one of two broad categories: the national type, which are in general reserved for Moroccans and children of Islamic origin, and the French-type schools which are open to all French, Moroccan or foreign children who wish to have the benefit of a French education. Both types of school are subject to the same administrative rules and are run internally on similar lines. The national origins of the teaching staff are the

same and they are recruited in the same manner. The only differences are in the curricula and in certain examinations peculiar to one or the other type of education.

Types of schools include *lycées*, *collèges*, first-cycle *collèges* and *cours complémentaires* (extended primary courses). Some schools include technical sections.

Lycées can be of either Moroccan or French type. Until the reform is fully implemented courses will last for 7 years, covering two complete 'cycles'. The *lycées* prepare candidates for the following examinations: lower certificate of secondary education (*brevet d'études du 1er cycle*); certificate of Moroccan secondary education (*certificat d'études secondaires marocaines*) (Moroccan schools only); entrance examination to the Regional School for Primary Teachers (École Régionale d'Instituteurs); entrance examination to the Moroccan Civil Service School (École Marocaine d'Administration); *baccalauréat*, parts I and II, classical and modern (classical in French schools only).

Collèges can also be either Moroccan or French. Courses run for 6 years, in two cycles, and lead to part I of the baccalauréat (part II can be taken from a *lycée*).

The *collèges du premier cycle* are Moroccan only. The main purpose of these schools is to decentralize secondary education.

Lastly, the *cours complémentaires* (1, 2 or 3 years) although belonging administratively to primary education, follow secondary curricula and may if necessary prepare students for the same examinations as the *collèges du premier cycle*.

Staffing of secondary schools. The school administrative staff consists of a principal, who is a *proviseur* (*agrégé* or *licencié*) in *lycées*, or a *directeur* (*licencié*) in *collèges;* a vice-principal (*licencié*), known as the *censeur*, who is mainly in charge of discipline and administration, and assists the *proviseur*, and *surveillants généraux* (boarding school and day school) mainly responsible for general supervision; an assistant principal (*répétiteur*) in *collèges du 1er cycle*, who assists the principal by carrying out general supervision; assistant masters (*répétiteurs*), whose qualification is a *baccalauréat* and who supervise the pupils; and lastly, in every *lycée* or *collège*, a bursar (*intendant* or *économe*) who is in charge of school finances and supplies and who is assisted by under bursars (*sous-intendants*) or house assistants (*adjoints des services économiques*). Ushers (*maîtres d'internat*) are responsible for the boarders while the children are in the dining halls or the dormitory.

Teaching staff includes *agrégés*, *licenciés* and *certifiés* teachers, semi-qualified teachers (those who hold three certificates but not a full *licence*), general instructors, teachers of Arabic, and *oustades* (who also teach Arabic). Teachers in secondary schools are specialists in a particular subject. A literature teacher is as a rule qualified only to teach literature, a mathematics teacher teaches only mathematics and so forth. Specialization is less rigid in the *collèges du 1er cycle*, where the teaching is mainly by non-specialists. The number of teaching hours required from teachers of arts and science subjects is as follows: *professeurs agrégés*, 15; *professeurs certifiés* and *licenciés*, 16; teachers of Arabic and *oustades*, 16; semi-qualified teachers, 18; non-specialist supply teachers for secondary classes, 18; non-specialist teachers in *collèges du 1er cycle*, 20. Additional remuneration is given for overtime. The number of teaching hours per week required from each teacher is so calculated as to leave him time to prepare his classes, correct exercises and keep abreast of literary and scientific developments.

A school board, made up partly of *ex officio* members and partly of elected members (all are members of the school staff) meets from time to time or as circumstances require, in order to deal with matters affecting the running of the school.

Recruitment of pupils. For all schools except *cours complémentaires* there is an entrance examination in the first secondary year. For the Moroccan-type schools these examinations test French and Arabic; for the French-type schools the examination is similar to the entrance examination for the sixth class of a secondary school in France. Pupils taking the modern sections are grouped according to age in the first secondary year and subsequently according to their standard of achievement, in order to make the classes as homogeneous as possible.

Curricula. Subjects taught in Arabic in the Moroccan-type schools include classical Arabic, ethics and civics, Islamic history and religious instruction (Koran and *hadith*). Subjects taught in French or Spanish include French, history and geography, mathematics and physical and natural sciences. The modern languages studied in these schools are English, Spanish or French; finally, the curriculum includes a number of subsidiary subjects—drawing, music and physical education.

In the former northern zone, teaching is also bilingual but greater stress is laid on Arabic. In the first cycle, all subjects are taught in Arabic; the second cycle is at present bilingual (Arabic/Spanish) with French as a compulsory modern language.

Since 1 October 1958 the number of teaching hours per week for the various subjects in the first and second years of Moroccan secondary education has been fixed as follows: Arabic 10; French or Spanish 6 (including 1 hour's supervised study); mathematics 6 (including 1 hour's supervised study); natural sciences 2; history $2\frac{1}{2}$; geography $1\frac{1}{2}$; physical education 2; total 30 hours.

The French schools have the same curricula and timetables as secondary schools in France, with the addition of 3 hours per week classical Arabic.

Achievement testing. Educational attainment is tested by means of oral and written tests and by end-of-term examinations; the latter are often replaced by less formal written tests. The results are entered as averages in the pupil's record book and in the end-of-term report sent to the parents. Pupils are placed for each separate test, for their general performance (all subjects) each term and, lastly, for the whole school year (*classement général*).

A staff meeting is held each term, when the teachers discuss each pupil in turn and state their opinion of his work and abilities. These assessments find concrete expression in a system of rewards (entry on a scroll of honour, encouragement, congratulations) and punishments (exclusion from the scroll, warning, censure, suspension).

At the end of the school year the teachers' council decides which pupils shall be promoted. Promotion is usually

automatic for those who have reached the average standard in all subjects. Pupils who have not reached the average standard are promoted only after passing an examination in certain subjects or a general examination. Those whose work has not been satisfactory must stay in the same class for another year or are expelled as unsatisfactory after being examined by the director of studies (*orienteur*).

A disciplinary board meets when necessary to deal with and punish cases of serious misdemeanour, and can finally expel a pupil provided the head of the Secondary Education Division agrees.

Vocational and technical schools

The main types of these schools have already been mentioned: apprenticeship schools, and the two types of vocational secondary schools (*collèges techniques* and *école nationale professionnelle*). The vocational secondary schools prepare students for the technical *baccalauréat* and for the various teaching certificates in industry and commerce (primary).

The Lycée Moulay Slimane at Fez started a course in preparation for the *baccalauréat* in economics in 1959.

In schools where there are French-type sections the same curricula are followed as in the *collèges techniques* in France. Moroccan sections have been instituted, which will follow special curricula.

Agricultural secondary education comes under the Ministry of Agriculture (a section preparing students for the École Nationale d'Agriculture has been opened at the Kénitra Lycée).

Education in domestic studies or in preparation for women's careers is given in the *collèges techniques*, as is commercial and industrial education. Only the building schools (*écoles du bâtiment*), which are in fact apprenticeship schools, are completely specialized. The other schools include several sections (industrial, commercial, women's).

A school was opened in October 1958 which in a 2-year course prepares students for the School of Engineering (of the type of the École d'Ingénieurs in Strasbourg). The latter will receive its first students on 1 October 1960 and in 3 years will train engineers for work in planning or operational offices.

Finally, it may be of interest to give details of two pilot schools: the École Industrielle (for boys) and the Collège Mers Sultan (for girls) both at Casablanca.

The École Industrielle includes: a section of the *école nationale professionnelle* type, which prepares students for the *diplôme d'élève breveté d'école nationale professionnelle;* classes which prepare students for the engineering schools at Aix, Strasbourg and Clichy (France); a technical section preparing students for the technical *baccalauréat;* an educational theory and practice section for training teachers of handwork; a Public Works section, preparing pupils for the examination for *adjoints de travaux publics* and for the entrance examination to the École des Travaux Publics at Cachan, France; a laboratory technician section for which there is a choice between chemistry and biology; an industrial section preparing students for the industrial certificate (*brevet d'enseignement industriel*); and a section preparing students for the technical teacher's proficiency certificate (specialized instructors).

The Collège Mers Sultan (girls) at Casablanca includes an educational theory and practice section for training handwork teachers; a section preparing students for positions as instructors in domestic economy; an applied arts section, which offers specially gifted pupils an opportunity of entering either the Collège de la rue du petit Thouars or the Collège Elisa Lemonnier; a commercial section (commercial teacher's certificate, part II); and an industrial section (industrial teacher's certificate).

Out-of-class activities

'Boarders' councils' act as intermediaries between the school authorities and the children. They are made up of delegates elected by their schoolfellows.

School clubs for educational, cultural or sports purposes are run by the children themselves under the guidance of the teachers. Some of these clubs assist in the running of the school. They include a committee of pupils elected by their schoolfellows, in charge of the management, running and discipline of the clubs, and of individuals running a wide variety of special activity groups (film clubs, reading circles, photographic, correspondence and inter-school exchange groups, drama, painting and drawing groups and so forth).

Most schools organize educational outings, lectures and art appreciation sessions. In addition, schoolchildren can receive free or reduced-price tickets for various cultural events (lectures, plays, and so forth).

The Physical Education Service organizes school sports events on holidays (inter-school football, basket-ball, volley-ball and other matches).

In some population centres there are cultural and recreational clubs for young people, run by the Youth Activities and Sports Service, which admit secondary school children.

TRENDS AND PROBLEMS

Technical education. Technical education is flourishing and 6,525 children are at present receiving secondary education of this type. The current problem is to develop to the full and get the maximum use out of the facilities that already exist and to establish new schools to meet the country's growing needs. When the 5-year school building plan is put into operation the situation will become clearer, and it will be possible to lay down precise objectives. The first of these will be a plan for primary education such as to produce a plentiful supply of good students for technical education; other objectives will be the provision of one year's secondary education for all children, and greater emphasis on direction finding, so as to sort out those children who will be directed towards a general education and those who will be advised to choose technical education.

It is already possible to distinguish certain main trends.

The provision of school facilities in the northern zone has been speeded up by the opening of more apprenticeship schools and of technical secondary schools (*collèges*) at Tetouan and Alhucemas.

Attention is being paid to the necessity of constantly

adapting technical education to the country's new needs. With this in view the number of commercial sections is being steadily increased, so as to produce skilled staff for the state and private sectors of the economy; an engineering school has been established, and it is planned to open a technical teacher training school.

More 'practical sections' (*sections pratiques*) are being started and their quality improved. These include a growing number of 2-year practical courses for Moroccan girls, including those in rural districts, who have completed a primary education. The courses provide a further general education while at the same time preparing the girls directly for family and social life. Similarly, practical courses in agriculture and rural crafts give boys in the rural areas an opportunity to pursue their trade without being uprooted from their environment.

Lastly, an increasing number of Moroccan (as distinct from French) vocational courses in industry and commerce is being provided. It has been found necessary to establish courses in line with the primary and secondary training which the non-French children receive before admission to technical education. These courses, which prepare pupils for the technical *baccalauréat*, the industrial certificate (*brevet d'enseignement industriel*) and the Moroccan commercial certificate (*brevet d'enseignement commercial marocain*) will follow time-tables and curricula of their own, so that the necessary technical standards may be maintained while at the same time a type of general education is provided which accords with the spirit of Moroccan education as a whole.

General education. The rapid growth of secondary education (54 schools with 32,079 pupils) has made decentralization a necessity, and in 1959 *collèges du 1er cycle* were set up in the medium-sized towns. Moreover, those secondary schools which already existed were expanded, and a number of boarding schools were opened. The opening of the new girls' secondary school at Meknès is one of many examples showing what is being done to cope with the increased intake of primary school leavers.

Although the provision and equipment of new school buildings is undoubtedly an urgent problem, the most important task is to work out a basic philosophy of Moroccan education. This is what the Ministry of Education is now trying to do, taking as its three guiding principles a uniform educational system, 'Moroccanization', 'Arabization'.

The existence of three types of state education (national, French, Islamic) has made the problem of providing school and university education so complicated that it has become imperative to establish a uniform system. The ultimate aim must be to give all citizens a common outlook so that there is no longer any difference between the Karawiyīn 'traditionalist' and the 'modern' student.

Curricula must be 'Moroccanized' so as to allow Moroccans to become conscious of their own individuality, based on a balance and harmony between two complementary worlds, East and West. The establishment of uniform curricula of a Moroccan type depends on the availability of textbooks which reflect these two aims of Moroccan education. The production of such textbooks is the subject of one of the plans of the Educational Research Centre. The Ministry of Education also aims to produce national textbooks which can be bought by all children whatever their social status.

Lastly, 'Arabization' is essential in a country whose religion, everyday language and traditions are based on the Arabic tongue. Nevertheless, while it is natural that Arabic should be the cultural vehicle for Morocco, Arabization must not lose sight of facts. French will be regarded as a second language, and will therefore be taught, starting at secondary level, as a tool for studying foreign cultures. Arabization, of course, is bound up with the staffing question. The problem is to recruit and train Moroccan teachers, and for this purpose it seems essential that the status of the teaching profession should be revised. The Institute of Secondary Education (Institut Pédagogique de l'Enseignement Secondaire) has been founded to train Moroccans for a teaching career; the future of the country depends on young people who will thus be equipped with a specifically Moroccan training.

STATISTICS

Population (mid-year 1958 estimate): 10,330,000.
Area: 171,305 square miles; 443,680 square kilometres.
Population density: 60 per square mile; 23 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, total enrolment[1] (not including 12,584 pupils in vocational schools at the primary level, an unknown number of students of higher Islamic studies, and some 2,000 persons in adult education classes) was about 660,000 pupils, representing some 6.5 per cent of the total population. Over 92 per cent of these pupils were in various types of primary schools. The proportion of girl pupils was 31 per cent in primary school, 29 per cent in general secondary schools and 36 per cent in vocational schools. Between 1953 and 1957, the primary school enrolment more than doubled while the secondary school enrolment increased by 45 per cent. (See Table 1.)

Enrolment trends in secondary education, 1930–57. In 1957, general secondary school enrolment was 9 times as high

1. It is not stated, though probable, that the statistics presented in the accompanying tables refer only to the southern zone (former French zone). For the northern (former Spanish) zone, data presented in the previous edition give a total enrolment, in 1953/54, of over 102,000 pupils at all levels of education.

as in 1930 and vocational school enrolment was 3 times as high as in 1945. The enrolment ratio has steadily gone up, but for the period 1955–57 the average total enrolment still represented only a little more than 5 per cent of the estimated population 15–19 years old. (See Table 2.)

3. EDUCATIONAL FINANCE, 1957 (in thousand francs)[1]

A. RECEIPTS BY SOURCE

	Amount
Total receipts	**17 731 565**
Central Government	17 717 785
Tuition fees	1 600
Other receipts from parents (for holiday camps)	2 180
Repayments	10 000

B. RECURRING EXPENDITURE BY LEVEL AND TYPE OF EDUCATION

	Amount		Per cent
Total recurring expenditure		**[2]17 731 565**	**100.0**
Administration		473 565	2.7
Instruction		16 038 000	90.4
Primary education	9 070 000		51.2
Secondary education	3 742 000		21.1
General	1 720 000		9.7
Vocational	1 840 000		10.4
Teacher training	182 000		1.0
Higher education	2 040 000		11.5
Adult education	326 000		1.8
Other education	860 000		4.8
For private schools	250 000		1.4
For Jewish schools	610 000		3.4
Other recurring expenditure (school meals, scholarships, subsidies to private schools)		1 220 000	6.9

1. Official exchange rate (1957): 100 francs = 0.24 U.S. dollar (approx.)

2. Of this sum, 15,718 million francs were spent on salaries to teachers, etc.

A modern school system is now developing in the Sultanate. There are two good primary schools for boys, catering for about 300 pupils each, in Muscat and Salalah, and a third has just been opened in Muttrah. In the villages throughout the country there are numerous little mullah's schools which teach the Koran, writing and arithmetic.

In Gwandur, Muttrah and Muscat, the Ismaïlis, the Khojas and Hindus have their own day schools for the children of their communities. The standard is from kindergarten to something less than matriculation. English is taught in the higher classes.

[*Text prepared by the Unesco Secretariat in January 1960.*]

STATISTICS

Population (mid-year 1958 estimate): 550,000.
Area: 82,000 square miles; 212,380 square kilometres.
Population density: 7 per square mile; 3 per square kilometre.

NEPAL

Nepal consists geographically of three distinct zones. In the south and bordering on India is the Terai, a strip of land cultivated in parts, the remainder consisting of dense forests. In the centre is the Nepal Valley which, although containing less than a tenth of the population, is of overwhelming importance in the economic life of the country. The third zone is the great mountainous tract stretching northward to Tibet, a region of hills and valleys with innumerable small villages. The population is a medley of different races, with three main languages and many dialects. These languages are Nepali, Newari and Hindi—Nepali being much the most important and the official language of the country.

THE EDUCATIONAL SYSTEM

Apart from the traditional Buddhist institutions, three types of school exist side by side in Nepal: the so-called English schools, originally patterned on the similar schools in India; the 'basic' schools where the curriculum follows the Gandhian pattern; and the *pathshalas* or Sanskrit schools which are not rigidly graded and in which much time is devoted to memorizing Sanskrit religious writings. Nepali is compulsory at all levels, but the mother tongue is the medium of instruction in the lower grades. English is introduced in the third grade of the 'English' schools. Most primary schools are village schools serving a local community. The full primary course in graded schools of English or basic type lasts 5 years. High schools, which generally have upper primary grades attached to them, are found in the towns and tend to serve a large area or region, but they do not represent a large proportion of primary level enrolments. For the present there is no question of universal compulsory education; a national plan drawn up in 1955 foresees the achievement of this goal in 1985.

Administration

The Ministry of Education is responsible to the Cabinet, the Prime Minister and the King, who jointly exercise both the legislative and executive functions of government. Educational policies, rules, regulations and orders, as promulgated, are published in the *Nepal Gazette*, the official organ of the Government, and become part of the School Code. Officials of the Ministry are members of such groups as the University Commission, the Textbook Commission and others, and the Ministry from time to time consults educational advisers under the foreign aid programme.

From the point of view of administration, three categories of schools may be distinguished: government schools, supported and administered entirely by the Central Government; government-aided schools which meet certain standards and receive varying amounts of financial aid; and independent schools. The control exercised by the Central Government depends on the amount of financial aid extended. Thus, the Ministry has only nominal control over unaided private schools, but as most of them desire

government grants they conform to established government patterns. The Ministry of Education, through the Director of Public Instruction, is directly responsible for all government schools and colleges. Government schools are headed by a headmaster, and colleges by a principal; private and government-aided schools are controlled by managing committees. Supervision, through inspectors and sub-inspectors, under the Director of Public Instruction, is compulsory for government and government-aided schools but is optional for private schools, who usually invite inspection when applying for a government grant. Curriculum matters in both primary and secondary schools come under an examinations board responsible to the Director of Public Instruction. There are also two Roman Catholic missionary schools which prepare for the Cambridge Oversea Certificate examination, and three 'basic education' schools which follow the curriculum prescribed by the Gandhi Memorial Trust Fund of India.

SECONDARY EDUCATION

There was no public provision for education in Nepal before 1877. In that year a school called the Durbar High School was established but its purpose was to educate the élite. In 1918 an intermediate college was established to bridge the gap between secondary and higher education and was affiliated to the Calcutta University.

In 1934 Nepali became the medium of instruction as well as of examination for the school leaving certificate (upper secondary) conducted by the Government School Leaving Certificate Board.

After the advent of democracy in 1951, the number of high schools rose rapidly to nearly a hundred and the total is steadily increasing. Some are privately endowed and managed while others receive aid from the Government. A few are boarding schools, but the standards of accommodation and teaching provided by these institutions vary greatly.

In 1954–55 the Ministry of Education appointed a National Education Planning Commission which drew up an educational plan for the succeeding period of 25 years. They recommended the development of multi-purpose high schools serving every district in Nepal and providing 5 years of free secondary education for as many boys and girls as possible. A new curriculum was prepared and tried out in 1958 in the Pokhara multi-purpose high school. It changed the old 'English' type of curriculum into one catering for a much wider range of abilities and interests: students take five basic subjects—social studies, science, Nepali, mathematics, and physical education—and two other vocational subjects, e.g., preparatory training for teaching, medicine, nursing, law, engineering, politics; commercial training for future secretaries, accountants, clerks and government office workers; agricultural courses covering all aspects of agriculture and forestry; industrial occupations; and home making. These various courses can lead to higher education.

Since 1956 the College of Education has offered a 4-year course, and, in addition, a 1-year course for secondary school graduates leading to the degree of Bachelor of Education. Both courses include the training needed for teaching in the multi-purpose high schools. At present there are 170 prospective secondary teachers enrolled in these courses.

TRENDS AND PROBLEMS

The main emphasis in secondary education is on the extension of the multi-purpose high schools. With their diversified courses these schools are intended to develop the skills and leadership so greatly needed for the social and economic improvement of the country. The satisfactory development of these high schools and of a practical system of education adapted to the needs of the students and the community will depend in the first place on the effective training of secondary school teachers.

THE EDUCATIONAL SYSTEM

The Netherlands educational system as a whole, and hence continued education,[1] has its juridical basis in Article 192 (at present 208) of the 1917 Constitution.

This article was the outcome, incidentally, of a political conflict which lasted for many years. The Netherlands educational system can only be properly understood if account is taken of the predominant feature of that conflict and of the national character—love of freedom.

Thus the passage in the Constitution to the effect that education is free relates not only to freedom as far as the provision of education is concerned but also to instruction itself, in the sense that parents can obtain the type of education for their children that they wish. The Government has translated this freedom into fact by providing private educational establishments with the necessary means to that end.

At the same time, the Constitution defines the state's own task by stressing that education is a constant concern of the Government. This stipulation, as well as the Government's obligation to present an annual report on education to the States-General, applies not only to public education in all forms but also to private education.

As far as public general elementary education is concerned, the Constitution specifies that it shall be provided by the authorities in each municipality in an adequate number of schools. For the other sectors of public education, the only other stipulation—which also applies to private education—is that the efficiency standards of education financed wholly or partly from public funds shall be regulated by law, with due regard to religious convictions. As far as private education is concerned, the Constitution lays down the general principle that education shall be free, except for supervision by the Government and, in so far as general education, primary and secondary, is concerned, except for examination of the ability and morality of teachers, the whole to be regulated by law.

Of very far-reaching significance is the passage in the article where it states that the cost of private general primary education fulfilling conditions to be imposed by law shall be defrayed from public funds in the same measure as public education. The conditions must guarantee the same standards as those stipulated for public education but must particularly respect the freedom of private education with regard to the choice of means of instruction and the appointment of teachers.

As far as private secondary education and preparatory university education is concerned, the Constitution says only that the conditions under which private education shall be granted contributions from public funds shall be laid down by law.

A typical feature of Netherlands education therefore is that the establishment or maintenance of private schools is encouraged by substantial subsidies, in many cases the whole of the personnel and material operational costs being defrayed. The fact that the conditions governing the teaching programme, school buildings and intellectual and moral fitness of the teaching staff are identical for public and private education ensures uniformity of standards.

Factors affecting the provision of education

Social factors. The Netherlands is a very densely populated country. The population figure has doubled since 1900 and this is one of the reasons for the increase in the number of pupils in every branch of education. Another is the growing demand for further education, due among other things to greater prosperity, increased subsidization, the lengthening of the period of compulsory education and the democratization of the educational system. The Netherlands is passing through a stage of rapid social and economic structural change which makes it essential for all intellectual forces to be used to the best advantage.

A shift is clearly perceptible in economic activities ranging from the agricultural and industrial sectors to the service sector. These changes, which are the concomitant of mechanization and automation, call for a rise in the level of technical knowledge and understanding all along the line. The shifts resulting from economic progress have already led to a marked expansion in post-primary education, the scope of which has nearly doubled during the past 20 years. The aim is to extend it in one form or another to all children within the near future.

Religious factors. To obtain a clear understanding of the specific legislation and the main principles of the reorganization plans, account must be taken of the religious situation in addition to the social factors. The bitter struggle for freedom of education, culminating in the equal status of public and private education in respect of financing, makes it easy to understand why many parents have made use of their freedom to choose a school for their children in harmony with their own convictions. The result is that about 72 per cent of the total number of primary schools are private (28 per cent Protestant, 42 per cent

1. Secondary education in the broad sense, in which it is used in the sub-title of the present *World Survey of Education*, meaning all types of post-primary education, is referred to in Dutch as *voortgezet onderwijs*, or continued education. This covers: (a) *voorbereidend hoger onderwijs* (VHO) or preparatory university education provided in the grammar schools (*gymnasien*); (b) *middelbaar onderwijs* (MO) or secondary education, referring specifically to the education provided by the modern secondary schools (*hogere burgerscholen*), lyceums (*lycea*), girls' secondary schools (*middelbare scholen voor meisjes*), and commercial schools (*handelscholen*); (c) *uitgebreid lager onderwijs* (ULO) or advanced primary education; (d) *voortgezet gewoon lager onderwijs* (VGLO) or complementary primary education; (e) teacher training for primary and pre-primary teachers; (f) vocational education below university level. Administratively types (a) and (b) are usually grouped as *voorbereidend hoger en middelbaar onderwijs* (VHMO).

Catholic and 2 per cent other groups) while about two-thirds of the schools providing continued primary education (VGLO schools) or advanced primary education (ULO schools) are private.

As to schools providing vocational training, over 90 per cent are private, while the corresponding percentage for preparatory university and secondary education (VHMO schools) is well over 60 per cent.

The public schools are open to all children without distinction as regards religious belief; individual religious convictions are respected and the ministers of the various churches are given the opportunity of conducting services for pupils whose parents so desire.

Role of public authorities

The role of the public authorities is clearly defined in the Constitution, which expressly recognizes the right of parents to choose the type of education they want for their children. Both the terms of legislation and the broad lines of the possibilities offered, as indicated for example in the Second Education Note to the States-General, emphasize clearly that such freedom of choice is a paramount consideration in view of the fact that education should form an integral part of upbringing, and that the upbringing of children is in the last resort the right and duty of their parents. This premise entails the imposition, in the general interest, of severe restrictions on official intervention.

The second principle is the positive task of the authorities to indicate the broad lines along which education should be developed, thus ensuring the necessary basic correlation between all the educational facilities provided, and the cohesion of the entire structure of education.

As the provision of education cannot be dissociated from many other aspects of social life, educational policy in its broad lines is regarded as a matter of general importance to the country, and efforts are made to maintain permanent contact with various departments. The Bill regulating continued education, based on the ideas expressed in the Second Education Note, proceeds explicitly from the two principles set out above and from the provisions of the Constitution.

Role of private agencies

The role of private agencies also reflects the government policy of freedom of education, whereby the guarantees for sound development are primarily sought from those initially responsible for it. In consequence, the Government has repeatedly stated its view that the prerequisite for sound development is increasingly intensive activity on the part of educational and school organizations, parents and education experts, until they are ultimately capable of effectively supervising and representing the whole of the field of education entrusted to them. A large measure of freedom and authority is delegated to school management boards, whether controlled by local authorities or by private associations. The Ministry, while exercising close supervision over the fulfilment of subsidy requirements, refrains from direct intervention. Private schools appoint their own teaching staff, the Government having no voice except with regard to the requirements of intellectual and moral fitness referred to above. Furthermore, school authorities are entirely free in the choice of educational equipment; and finally, if, in the opinion of the school inspector, the curriculum at any primary school (including VGLO and ULO schools) falls short of requirements, the case is judged not by the Ministry but by the Educational Council, a body fully independent of the Government (see page 850).

THE DEVELOPMENT OF SECONDARY EDUCATION

Before a clear picture of the origin and history of the various types of school and of legislation dealing with continued education can be obtained, a few further observations on the evolution of Dutch educational legislation in general will be necessary.

Educational freedom first came into existence after a hard-fought intellectual struggle which influenced political life over a long period and was reflected in legislation. In the early nineteenth century the Government, influenced by the rationalism predominant at the time, viewed private schools with scant approval, for they were considered sectarian. In the second half of the century the spread of liberal ideas brought about a changed attitude towards the needs of those who could find no satisfaction in the national unitary school. The Constitution which followed the triumph of liberalism in 1848 contained the principle of educational freedom, and the legislation governing primary education was to a certain extent brought into harmony with it in 1857. However, many amendments were still necessary before further consequences of the accepted principle were drawn in the 1917 revision of the Constitution.

Advanced primary education (ULO), originally owed its growth to private initiative, and though already referred to in the 1857 Act, no subsequent mention appeared in the 1878 Act. In spite of the unsatisfactory legal position, however, this type of education gradually expanded and, between 1902 and 1914, private Protestant, undenominational and Catholic associations were established to provide it.

In 1907 the first examinations were held, after which a strong tendency developed towards standardization of programmes and curricula. Economic progress led to a heavy demand for manpower with a modicum of education. Improved subsidies led to the further expansion of this type of school, more particularly after it had reached the stage of full development, through its inclusion among the schools participating in the system of automatic equalization introduced under the 1920 Primary Education Act.

Complementary primary education (VGLO) came into being as the lowest step in continuation education after the second world war. VGLO schools are designed for children who will begin work as soon as they have completed their compulsory education.

The modern secondary school (*hogere burgerschool*) (HBS) was, originally, also intended as a final stage in education. A few secondary schools were indeed in existence at the beginning of the nineteenth century, alongside the Latin schools and *gymnasia*, but the period of greatest expansion came immediately after 1863, when the

Secondary Education Act (*Middelbaar onderwijswet*) established the HBS, whose 5-year course was designed to provide a general education as well as a foundation for specific purposes but was not intended as a preparation for university study. In fact, however, it was used for that purpose, and under the Limburg proposal (Act of 7 November 1917), holders of the final HBS diploma who had completed a 5-year section B course were allowed to sit for examinations in the faculties of medicine, mathematics and physics. Pupils completing their course in the literary and economics section—the HBS-A, which was regulated by law in 1937 (Law of 22 April 1937)—receive a diploma which admits them to another limited group of fields of study.

The *gymnasium* was granted legal recognition as a preparatory school for higher education under the Higher Education Act of 1876, which, like the Secondary Education Act of 1863 already referred to, is still in force, though extensively amended. Since 1900, private *gymnasia* have had the right to conduct university entrance examinations (the *jus promovendi*), and have been receiving government subsidies since 1905. The *lyceum*, which may be regarded as a combination of the *gymnasium* and HBS, has not yet obtained legal recognition as an independent type of school and is therefore governed, as far as the combined lower forms are concerned, by a variety of legal provisions.

The girls' secondary schools (*middelbare scholen voor meisjes*) were regulated by the law of 2 April 1948.

Commercial schools, notwithstanding the expansion of Netherlands trade in the nineteenth century, had difficulty in obtaining their own status and form. The Secondary Education Act of 1853 was designed to meet the demand for a type of school closely adopted to social requirements and bearing in mind the importance of trade. In practice, the HBS developed rather in the direction of preparation for university study. The situation was improved by the introduction of the HBS-A course which, like the commercial day and evening schools, is governed by the Secondary Education Act.

Primary school teacher training was regulated in 1952 by separate legislation (law of 23 June 1952, and decision of 9 December 1953 regarding the implementation of certain articles in the Training Colleges Act). It had previously been governed by the Primary Education Act.

Technical schools were first established in the middle of the nineteenth century as a result of private initiative, and were first regulated as such by law under the Technical Education Act of 4 October 1919. This law also concerns home economics schools for girls.

As regards agricultural and horticultural schools, the oldest institutions date from well back in the last century, but it is only in the past 50 years that this branch has shown a marked degree of expansion, thanks to private initiative. The schools come under the control of the Minister for Agriculture, and apart from certain provisions in the Secondary Education Act have not yet been regulated by law. They are, however, being regulated in the Bill on Continued Education now in the course of preparation.

The co-ordination of the various laws was already considered as urgent at the beginning of this century. In 1903 a Co-ordination Committee was established for the purpose of drafting a new form of organizational structure for education, but while the substance of the commission's report was made use of, no coherent plan for the whole was established.

Attempts made in 1934 and in 1946 had just as little success. In 1951 a Note dealing with educational facilities was issued by the then Minister, Mr. Rutten, setting out guiding principles for the gradual reorganization of education from the instructional standpoint. The Second Education Note, issued in 1955 by Mr. Cals, the Minister, and Mr. de Waal, the Secretary of State, took up and developed the first Note by dealing with the legislative problems also.

The principles set out in the second Note were developed, *inter alia*, in the Bill regulating all post-primary education (*voortgezet onderwijs*) (29 October 1958), after many experts and organizations had been given an opportunity of expressing their views on the matter.

Administration

The foundation of VGLO and ULO schools is regulated by the Primary Education Act and is to some extent automatic. Provided certain conditions are fulfilled, a private school of either type can be founded without any prior need for its inclusion within the framework of a school planning project. However, the estimated number of pupils must be above a certain minimum. This minimum is not high for ULO schools, being fixed at 61 in towns with more than 100,000 inhabitants and 24 in smaller communities. For VGLO schools the totals are fixed at 91 and 31 respectively. In the case of schools which can be expected to fulfil these conditions satisfactorily—this is assessed on the basis of parents' signatures—the association wishing to establish the school can, on payment of a surety, automatically obtain the money required for its establishment from the local authority, this surety is repaid after 20 years if the number of pupils appears to have remained consistently at the level fixed. This partly explains why the number of ULO schools in particular has risen very quickly. In the case of *gymnasia* or HB schools, on the other hand, the Minister decides whether a school applying for a subsidy is necessary or not; and only when he has decided in favour and the relevant budget item has been approved by Parliament can the subsidy be paid, while before a technical or home economics school can be established, a recommendation is required from the local authority specifying that the establishment of a school of this type is necessary.

Although the Ministry in no way wishes to act as a central body administering and controlling educational affairs at will, a certain degree of planning for education at secondary level appears essential and hence the Bill on secondary education also makes provision for specific planning procedure, involving the annual establishment by the Minister of a list of schools he wishes to be considered for the receipt of financial aid during the next three years, a proportion of those listed to be included in the budget estimates each year. In principle, the Minister's list will be established on the basis of partial lists received from school and local authorities throughout the country, to which

the Minister will add the state schools considered necessary. For most of the school types mentioned, the Bill lays down standards fixing the minimum pupil strength of schools, and if it can be proved, on the basis of statistical data, that the size of the schools to be established may reasonably be expected to comply with these standards, the Minister is bound to include them in his list. In addition, he may include other schools, even though not complying with the standards, if in his judgement the need for them exists. The system outlined must therefore be regarded as a combination of planning and the objective application of minimum enrolment standards (automatism).

Advisory boards. The Educational Council, whose independence of the Ministry has already been stressed, is established by law and its members appointed by the Crown. Its function is to advise the Minister of Education, Arts and Sciences, either at his request or on its own initiative, on general problems relating to education (curricula, proposed legislation, reorganization plans, etc.). The Council has four departments—for higher education, pre-university and secondary (*middelbaar*) education, general primary education (including also continued primary education, teacher training schools and pre-primary schools), and vocational training. The various laws require the Minister to seek the Educational Council's advice concerning the organization of schools of the various types and in most cases it is followed. Moreover, he usually seeks the advice of government inspectors as well as of various organizations active in the educational sphere. Particular mention should be made of the Pedagogical Centres, of which four now exist (1 Roman Catholic, 1 Protestant and 2 general).

Suggested curricula are generally prepared by the government inspectors. The opinion and advice of the Educational Council, and possibly of one or more of the above-mentioned advisory bodies, is then obtained, after which they are finally fixed by the Minister.

GLOSSARY

NOTE. Literal or conventional English translations of Dutch terms are placed before the definitions.

algemene landbouw- of tuinbouwschool (secondary agricultural or horticultural school): vocational secondary school for property administrators and managers; sometimes specialized on one subject (e.g. dairying) then known as *landbouwvakschool.*

avondnijverheidsschool (technical evening school): part-time vocational training school for boys.

bedrijfsschool (industrial school): vocational training school usually attached to a factory.

gewoon lager onderwijs (elementary education): primary school, often with attached continuation classes (*voortgezet*).

gymnasium (grammar school): general secondary school of academic type, with two streams, A (languages) and B (science).

handelsonderwijs (commercial training): vocational training schools of commerce of various kinds, including the *handelsdagschool* (day school), *handelsavondschool* (evening school) and *school voor winkelpersoneel* (school for shop assistants).

hogere burgerschool (modern secondary school): general secondary school with two streams, A (languages) and B (science).

huishoudschool: vocational training school of home economics.

klein-seminarium (junior seminary): general secondary school of academic type providing initial training for intending Roman Catholic priests.

kleuterschool (infant school): pre-primary school.

kunst-, kunstnijverheid- en bouwkunstonderricht (instruction in arts and crafts): vocational secondary school of fine arts and crafts.

kweekschool: teacher-training school for primary teachers.

lagere land- of tuinbouwschool (elementary agricultural or horticultural school): part-time vocational training school of agriculture or horticulture.

lagere technische dagschool (elementary technical day school): vocational training school.

middelbaar technisch onderwijs (intermediate technical education): vocational secondary school.

middelbare school voor meisjes (intermediate school for girls): general secondary school of non-academic type for girls.

opleiding voor nijverheidsonderwijs: training classes for intending teachers in vocational schools for boys (*jongens*) or girls (*meisjes*).

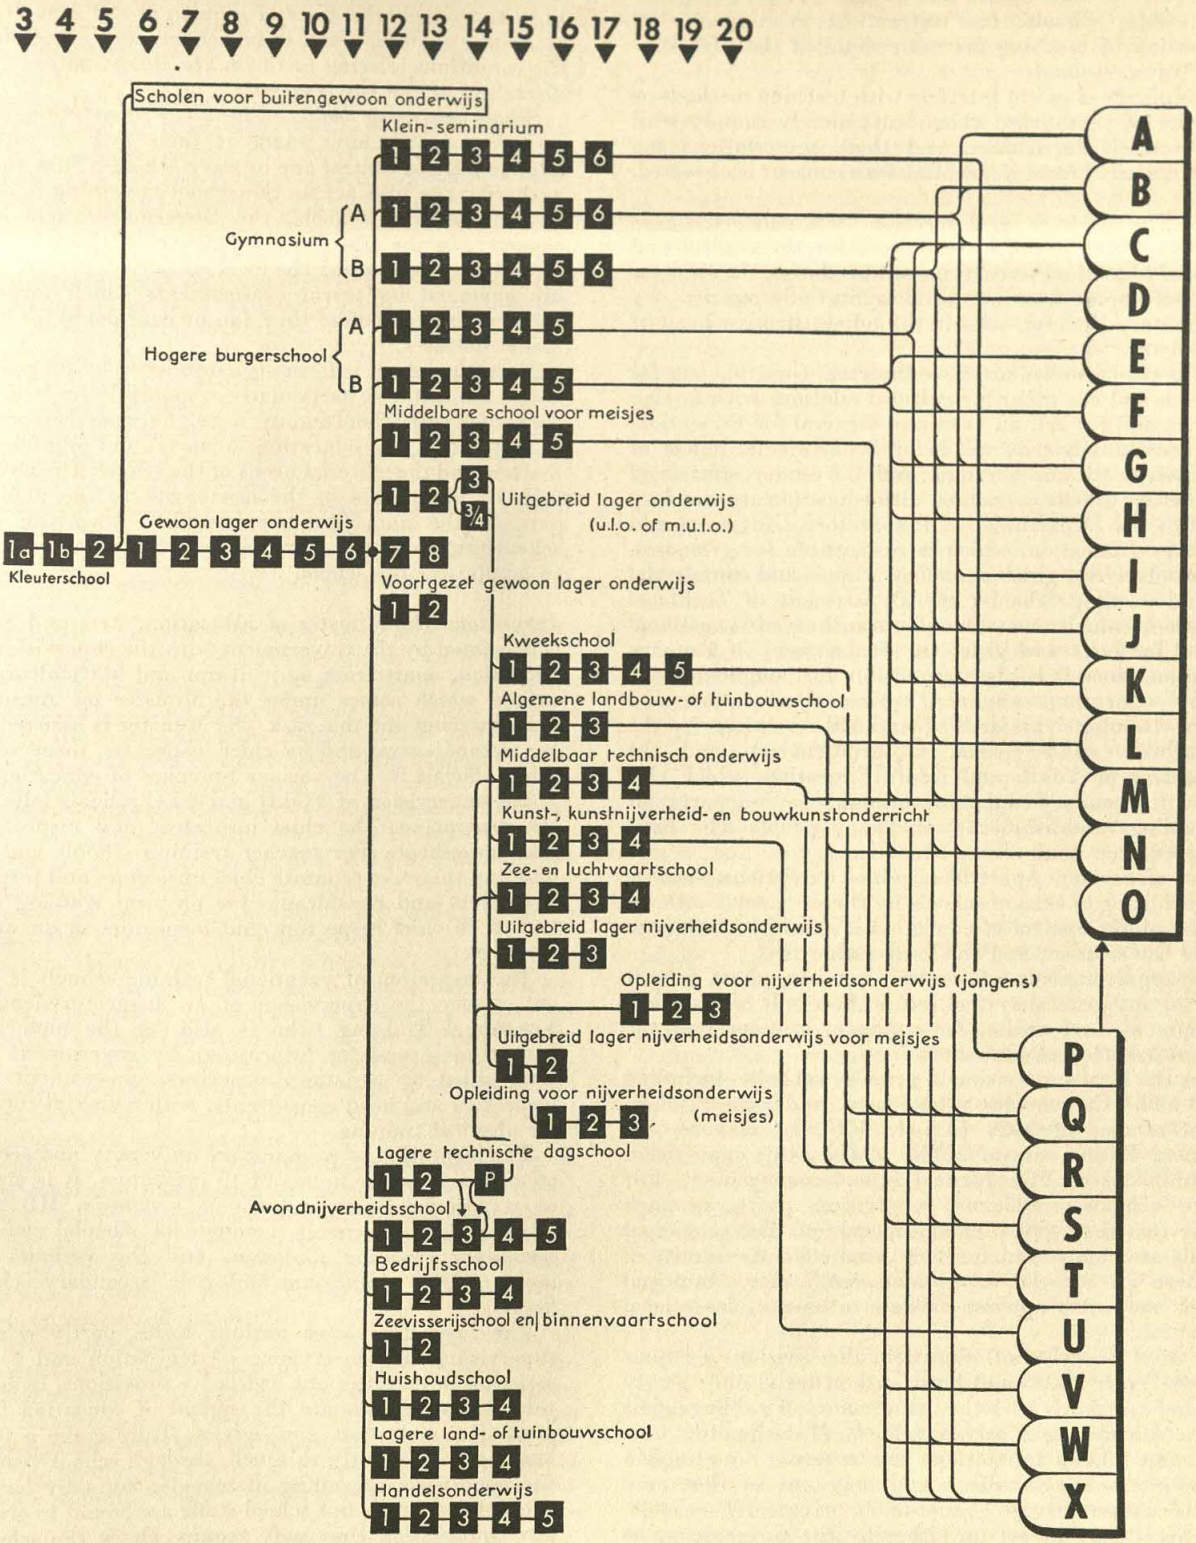
scholen voor buitengewoon onderwijs: special schools for physically and mentally defective children.

uitgebreid lager onderwijs u.l.o. of m.u.l.o. (advanced primary education): lower general secondary school.

uitgebreid lager nijverheidsonderwijs (advanced vocational training): vocational training school for boys or for girls (*voor meisjes*).

voortgezet gewoon lager onderwijs (complementary primary education): upper two years of eight-year primary school, with practical bias, sometimes a separate institution.

zee- en luchtvaartschool (navigation and naval and aircraft mechanics school): vocational training school.



zeevisserijschool en binnenvaartschool (seafishery and inland navigation school): vocational training school.

For public schools, the instructions relating to the organization of teaching are more detailed than for subsidized private schools.

The Ministry does not interfere with teaching methods or the choice of textbooks, which must merely comply with the prescribed curriculum, and these prescriptions too may be departed from if the Minister's consent is obtained.

Control. The Minister for Education, Arts and Sciences is responsible, within the Government, for the control and quality of education. In carrying out his duties, the Minister is assisted—apart from one or more State Secretaries—by the Secretary-General, who is the administrative head of the Ministry.

Under the Minister are two Directors-General, one for education and the other for cultural relations with foreign countries and for art, an Inspector-General for Education, three general advisers, heads of departments, chiefs of sub-departments and services, and the senior officials of the Ministry. Chiefly concerned with education at secondary level are: the Department of Preparatory University and Secondary Education, which is responsible for *gymnasia*, HB schools, *lycea*, girls' secondary schools and commercial day and evening schools; the Department of Technical Education, which controls all branches of vocational training for boys and girls; the Department of Primary Education, since it is also responsible for complementary primary education, advanced primary education and teacher training (welfare educational training is the responsibility of a special sub-department); and the Department of Youth and Adult Education, which also deals with secondary education through its sub-department for training establishments for young people who have completed their compulsory education.

Local authorities. Apart from minor exceptions, such as the subsidizing of certain schools by the provincial authorities, the public control of education is shared between the Central Government and the local authorities.

The apportionment of control between them is not based on any general system but is the result of historical development, and varies, for example, in respect of the different branches of education.

Thus the local supervision of primary schools—including VGLO and ULO schools—is entrusted, under the Primary Education Act of 1920 (Article 176), to mayors and aldermen. In the case of public schools, this supervision is combined with the duty of school management. For private schools, municipal supervision plays a much smaller role than government supervision. The municipal councils are competent to set up local control committees but these are of relatively minor significance. Municipal councils may also appoint officials to ensure closer local supervision.

For most branches of education, the division of labour between Government and local authorities is only partly regulated as regards both the maintenance of public schools and the subsidizing of private schools. Municipalities with more than 20,000 inhabitants are required to establish and maintain a *gymnasium* and may not in that case subsidize either private *gymnasia* or private HB schools. HB schools may be set up either by the Government or by the local authorities. Both the amount of State contributions towards the costs of municipal HB schools, girls' secondary schools, commercial schools and *gymnasia*, and the conditions relating to them, are almost entirely at the discretion of the Government.

School governing bodies. These are institutions or associations which have made it their task to establish, administer and control one or more schools. Thus the local authority can also act as the school governing body. For government HB schools, the Government acts in this capacity. In the case of public *gymnasia*, there is a board of trustees representing the local authority. Private schools are governed by private associations which must have corporate status before they can be considered for government subsidies.

Since the school is formally established by its governing body, the latter is particularly responsible for everything connected with school maintenance, the general organization of instruction and education, financial and administrative matters and the material needs of the school. The governing body is responsible in the last resort to the pupils and parents, the immediate responsibility devolving on the school principal, who is appointed by the governing body to administer the school.

Inspection. The Minister of Education, Arts and Sciences is delegated by the Government with the supervision of all education, apart from agricultural and horticultural education, which comes under the Minister for Agriculture.

In carrying out this task, the Minister is assisted by an Inspector-General and by chief inspectors, inspectors and other officials for the various branches of education.

The supervision of VGLO and ULO schools falls within the province of the chief inspectors and inspectors for primary schools. For teacher training schools and school building there are separate chief inspectors and inspectors. Inspectors and consultants for physical training are attached to chief inspectors and inspectors in an advisory capacity.

The inspection of vocational training schools is carried out, under the supervision of an Inspector-General for Vocational Training (who is also, at the moment, the Inspector-General for Education), by government inspectors, aided by assistant inspectors, government women inspectors and head consultants, with a special consultant for physical training.

The inspection of preparatory university and secondary education is in the hands of 15 inspectors. It is organized on a regional basis and covers *gymnasia*, HB schools, girls' secondary schools, commercial schools, courses for secondary teaching diplomas, and the various departments (HBS, *gymnasium* and girls' secondary school) of *licea*.

The inspectors have various tasks, partly related to supervising the observance of legislation and partly to assisting in carrying out legislative provisions. In addition, they strive to promote the spread of education through mutual consultation and advice. They make a point of keeping permanently in touch, through school visits, with the conditions prevailing in schools; not only have they the right of entry, but school staffs are bound to give them any information they may require about the school and the tuition given.

The inspectors co-operate in establishing the curricula for public schools. Although they do not co-operate with private schools for this purpose, the latter's curricula must be submitted to the public education authorities and checked by the inspectors annually.

With regard to local supervision, details concerning control by local authorities have been given above.

Catholic and Protestant schools have organized a form of school supervision within their own spheres.

Finance. Except for higher education, where private schools are only partially subsidized, it can be said that both public and private education in the Netherlands are fully supported by the authorities.

VGLO and ULO schools. The Government meets the whole of the cost of teachers' salaries in both public and private schools of these types. In both types of school, the operational costs in respect of the buildings, teaching aids, furniture, etc., are charged to the local authority, as are also the capital expenditures.

The annual indemnity for operational costs is worked out on the basis of the corresponding cost per pupil at public schools, and is just as high for private schools as for public schools with an equivalent number of pupils.

Preparatory university (VHO) and secondary (MO) schools. Teachers' salaries and operational costs are paid in full by the Government for state schools, and by the local authority for municipal schools. On their request, however, the State allocates municipalities maintaining HB schools, *gymnasia* and girls' secondary schools a small subsidy towards covering such costs. In the case of municipal commercial day and evening schools, the State grants a 50 per cent subsidy. The establishment costs for buildings are met on the basis of a 100 per cent annuity. The annual operational costs in respect of equipment are reimbursed on the basis of the comparable costs per school, per class and per pupil at public schools.

Teachers' salaries in VHMO schools are fixed by the Government in the same way as those of primary schoolteachers. The basis is the number of teaching periods, but any lessons over and above 32 a week are not paid by the State. A total of 26 periods a week ranks as full occupation. A graduate teacher receives more than a non-graduate. The maximum salary is roughly 60 per cent higher than that for primary schoolteachers.

Vocational training. To institutions and associations having corporate status and to municipal services (thus covering both private and public schools), the State grants a subsidy of either 70 per cent or 75 per cent of the net costs. The remaining 25 or 30 per cent is the responsibility of the local authority, which can recover it in part from other local authorities involved.

Teacher training schools. The State pays the whole of the salaries for both public and private schools. The operational costs in respect of buildings, teaching equipment, furniture, etc., are fully met by the State on the understanding that the reimbursement of costs to private (including municipal) schools is calculated on the basis of the costs of public teacher training schools of comparable size.

School fees. During the 6 years of primary school and the first 2 years of the VGLO school until the pupil is 15, no fees are payable except for a possible extra charge on behalf of the school. For other schools, fees are determined in the light of the income tax assessment of the parents.

Scholarships. During the past few years, the system of scholarships and interest-free loans has become very widespread. As a result, students have greater facilities for engaging in studies matching their capacities than was formerly the case.

The facilities cover study at preparatory university and secondary schools, vocational schools, teacher training schools, nursery teachers' training courses, art and music academies, ballet schools, drama schools and universities and university colleges. Some 20 million guilders were made available by the Government in 1958 for scholarships and interest-free loans.

School buildings. Under the Primary Education Act of 1920, a decree on building, applying equally to public and private schools supported entirely or partly out of public funds, was issued on 3 March 1924 (*Official Gazette* No. 95, recently amended by Royal Decree of 15 September 1950, *Official Gazette* No. K 404). This decree contains the minimal educational and health requirements relating to the building and installation of school premises and grounds.

Aesthetic and other considerations connected with the relation of the school buildings to their surroundings are not dealt with, but the chief building inspector can indirectly exert influence in this direction by advising the school and local authorities. The plans and buildings for *gymnasia* are, under the terms of the Higher Education Act, subject to the Minister's approval and to the supervision of the Government Building Service. The Secondary Education (MO) and Vocational Education Acts contain similar provisions.

School welfare services. The supervision and control of pupils' health is ensured by 140 school medical services, which in large communities are usually sub-departments of the local medical and health service. Smaller communities usually combine to set up joint school medical services.

Apart from ensuring that the buildings are hygienic, it is the task of these services to examine pupils individually. In so doing, the mental health of the child is kept in mind as far as possible. For specific difficulties connected with teaching or upbringing, the advice of medico-pedagogical bureaux is generally called in. A law of 9 July 1953 protects pupils against the risk of infectious diseases among the teaching staff: anyone connected with a teaching institution must be in possession of a valid certificate to the effect that he is not suffering from tuberculosis of the respiratory organs. Supervision is exercised by the medical inspector of public health. Teachers on first appointment must undergo a general medical examination. School dentists visit the schools and in many cases treat any defects they discover.

The schools provide milk at cost price to children wanting it. Free school meals and clothing are provided with the co-operation of a number of private associations. These services, on which local authorities spent 1.6 million guilders in a single year, are run on a charitable basis.

TYPES OF SECONDARY EDUCATION

The ordinary primary school has 6 grades. When children reach the age of 12 they must usually choose another school, about 35 per cent going on to ULO schools and 15 per cent to preparatory university and secondary schools.

After the seventh year of primary schooling, about 40 per cent of boys transfer to a vocational training school or an elementary agricultural or horticultural school. About 35 per cent of girls transfer to a home economics school after 6 years of primary schooling. There remains a group which may either remain in primary school for the seventh and eighth year or transfer to 2-year VGLO schools or classes.

Lessons designed to serve as a preparation for entry into various vocations are sometimes given in the top grade of the primary school. In addition, parents may obtain advice from the school principal or from a vocational guidance bureau. As a *lyceum* has one or two classes devoted to preparation for adult community life, pupils may postpone their decision for a short time.

The school year usually runs from September to September, with holidays at Christmas and Easter and a long summer holiday from mid-July to September. The school week normally has 6 days, of which 1 or 2 are usually half holidays. However, there are a number of variations to the rule, which is also true for the school day, which although usually divided into morning and afternoon periods, sometimes continues with breaks until early afternoon.

General secondary schools

Gymnasium. It has already been explained that this type of school is governed by the Higher Education Act and serves as a preparation for the university. While no entrance examination is prescribed, one is usually set, especially in Dutch, arithmetic, geography and history. Sometimes the new method is followed of having 2 to 4-week trial classes.

The *gymnasium* course lasts 6 years, following on the 6 years of primary school. In their fifth year pupils are divided between section A, with emphasis on Greek and Latin, and section B, with emphasis on the exact sciences. For the public *gymnasia*, the general curriculum and detailed time-table are established by Royal Decree (of 7 June 1919, *Official Gazette* No. 313, as amended). The time-table is given below.

Curricular prescriptions are less detailed for private *gymnasia*, but must provide for a fixed minimum number of lessons per subject, and the maximum total number of periods per class must be completed.

At the end of the study course, an examination is held under the supervision of a panel appointed by the Government.

Diploma A entitles the holder to sit for examinations in the faculties of divinity, arts and philosophy, and in the faculty of medicine also under specific conditions. Diploma B allows entry to the faculties of medicine, mathematics and physics, veterinary science, arts and philosophy (in so far as the study of classical languages is concerned), engineering and other fields of study. Both diplomas A and B allow entry to the faculties of law, agriculture, economics, political and social sciences and several other fields of study.

Those who have studied at an evening *gymnasium* or otherwise may also sit for a government examination qualifying them for a diploma with the same rights. This also applies to HBS pupils.

Hogere burgerschool. The HBS course covers 5—and sometimes 6—years. Originally intended as general educational schools preparing pupils for earning a livelihood, HB schools have also provided preparatory university education since 1917. An entrance examination is compulsory. The same subjects are taught as in a *gymnasium*. Where the results of the written entrance examination do not tally with the opinion given by the principal of the primary school, an oral examination is held. There are two types of HB schools, A and B, which have the same curriculum for the first 3 years. In type A schools, more attention is paid to social subjects and languages. For public HB schools, the curricula and time-tables are fixed by Royal Decree of 28 May 1954, *Official Gazette* No. 291. The time-table is reproduced on the following page.

As in the case of private *gymnasia*, the prescriptions for private schools of this type are less detailed. At the end of the 5 or 6-year course a final examination is given by a panel consisting of the teachers of the top classes and experts annually appointed by the Minister.

The HBS-B diploma entitles the holder to sit for examinations in the faculties of medecine, mathematics and physics, veterinary science, engineering, agriculture and in certain other fields. Both A and B diplomas entitle their holders to sit for examinations in the faculties of law (notarial studies), economics, political and social science, and in several other fields (social science, social geography, psychology and education).

Lyceum. The *lyceum* as such is not regulated by law. It is a combination of gymnasium and HB school and gives

5- or 6-year courses and a 1- or 2-year course as preparation for community life. It does not issue its own diploma. *Lycea* sometimes have a girls' secondary school attached.

Girls' secondary school. This is also an independent type of school, with 5-year courses. Prescriptions for the minimum and maximum number of lessons are laid down by the Royal Decree of 21 June 1955, *Official Gazette* No. 291.

A specimen time-table for a public school of this type is shown below.

TIME-TABLE FOR GIRLS' SECONDARY SCHOOL
(in periods per week)

Subject	Year of study				
	1	2	3	4	5
Dutch language and literature	4	4	4	4	4
French language and literature	5	3	3	3	4
English language and literature	3	3	3	3	4
German language and literature	–	3	4	3	4
Geography	3	2	2	2	2
History	4	2	2	2 (4)	2 (3)
Mathematics	5	2	1	–	–
Physics	–	–	3	3	–
Chemistry	–	–			–
Botany and zoology	2	2	–	1	1

Handicrafts	–	2	2	2	2
Music	–	1	1	1	1
Physical training	3	3	2	2	2
Total	32	29	29	30	29

The final examination is taken under the supervision of a panel appointed by the Minister.

The final diploma allows entry to a number of schools for advanced vocational education but not to universities or university colleges.

Commercial schools. Day schools generally give 4-year courses, although there are a few which run a 3-year course. Subjects taught include: Dutch, French, English, German, commercial subjects, geography, history, political institutions, political economics, mathematics, physics, chemistry, writing, drawing, physical training. The syllabus is regulated by the Royal Decree of 21 June 1955, *Official Gazette* No. 292. The final diploma gives no right of entry to universities. A large proportion of the diploma-holders find a place in the economic and administrative branches of business life. In addition to the commercial day schools there are commercial evening schools with courses ranging from 3 to 5 years, all of which prepare pupils for the diploma.

Advanced primary (ULO) schools. Although regulated by the Primary Education Act of 1920, ULO schools have since that date become administratively separate from the primary schools proper and are in their own way a type of secondary school. They have a dual purpose as final classes and as a bridge to more advanced schools. Entry is usually dependent on the report of the principal of the primary school.

Apart from the primary school subjects of reading, writing, arithmetic, Dutch, nature study, geography, Dutch history, singing, drawing, physical training—and handicrafts for girls—at least three out of the following group of subjects must also be taught: French, German, English, mathematics, commerce. Further optional subjects are general history, handicrafts, agriculture, horticulture, needlework and home economics.

Below is a time-table based on the draft curriculum for public ULO schools at The Hague in 1959.

The teacher-pupil ratio must be at least 1:30. As a rule, the specific ULO subjects are given by the same teacher in all forms. He must have a special diploma for the subject taught.

In general, the ULO school course is 4 years, but is sometimes 3. The examination, for which there are no legal regulations, is arranged by two special examining bodies and includes written and oral sections. About 50 per cent of all pupils at ULO schools obtain the diploma, which is in great demand both for entry to other types of school and for appointment to posts in various public services.

Complementary primary (VGLO) schools. VGLO schools are specially designed for pupils who, while wishing to attend day schools for some time after completing the normal 6 years at primary schools, will usually begin earning their living immediately after completing the compulsory period. This type of school has at least two grades and is usually a separate institution, i.e., only in exceptional cases are VGLO departments attached to ordinary primary schools.

Special attention is paid in these schools to the development of manual skills with emphasis on manual training for boys and needlework and home economics for girls. The pupils are usually of normal but poorly developed intelligence, most of them coming from the socially and culturally less privileged sections of the population. Unlike the ordinary primary schools, where education can be classified in the order head-heart-hand, the order in these

schools is rather hand-heart-head. Apart from the subjects taught in the primary school, instruction may be given in two modern languages and one or more of the following: mathematics, commercial practice, agriculture and horticulture.

ULO TIME-TABLE
(in periods per week)

Subject	Year

Total	37	38	37 (39⅔)	39 (⅔)	39 (41⅔)	39 (⅔)

Notes

1. In the first year, one of the two arithmetic lessons may be replaced by a lesson in commercial arithmetic, and in the second year one of the commercial periods may be devoted to arithmetic.
2. In the third and fourth years, pupils may attend either the mathematics or commerce classes. In the first year only algebra is taught in the mathematics classes.
3. If there are no facilities for chemistry lessons, the classes set aside for such lessons are devoted to other subjects.
4. Home economics is optional in the third year and compulsory in the fourth. If there are no facilities for teaching it in the fourth year, needlework lessons are given in its place.
5. The periods set aside for religious teaching—one weekly per class—are given during normal school hours by an instructor who may be assigned by the parish authorities.
6. In any class, there may be two periods a week which deviate from the set time-table provided the teacher concerned has previously consulted the principal on the matter.
7. There are three fourth-year classes—4a, leading to the A diploma with mathematics, 4b, leading to the B diploma, and 4c, leading to the A diploma with commercial subjects.
8. Subject to approval, English lessons may be begun before German in the first year, in which case the time-table must be adjusted accordingly.

Educational institutions for children who have completed compulsory schooling. This type of activity, which originated after the second world war and developed rapidly, covers both education and youth work. The aim is to assist young people (usually boys 14 to 17, and girls over 17) who are beginning to earn their living by providing them with an educational environment adapted to their new situation and their phase of growth, and so helping to shape their personality. These training establishments come under one of the following three national institutions: the National Foundation for Mater Amabilis Schools and other institutions providing part-time education for girls; the National Board of Catholic Life Schools for Boys and Young Men; and the National Centre for the Training of Young Workers.

At the end of 1957 these institutions were catering for about 34,000 young people, including 5,000 boys. Twenty-five per cent of the girls and 85 per cent of the boys attend day classes. The 1958 national budget estimates set aside about 3 million guilders for this purpose. Of the total subsidy provided by the public authorities, amounting to a maximum of 80 per cent of the operational costs, the State shoulders 40 per cent. There are also subsidies by the provincial and local authorities, while about 25 per cent is obtained from private sources.

Teachers in general secondary schools. Prospective secondary school teachers (*gymnasium*, HB school, *lyceum*, girls' secondary school, commercial day school or evening school) may either study at a university or university college or qualify for secondary school teacher's certificates.

After successfully completing a degree examination (*doctoraal examen*) at a university or university college, a certificate is issued listing the subjects which the holder is qualified to teach at a secondary school. To obtain an appointment as teacher, the holder, apart from his university studies, must furnish proof that he has had a complete pedagogical training in general, and training in the subjects, or one of the subjects, for which the certificate is requested, in particular. This can be issued before or after his final degree examination. In addition, the candidate must have attended classes at a secondary school as an observer. The course takes 5 to 6 years.

Teachers in VGLO and ULO schools are trained at primary teacher training schools (*kweekscholen*), which are described below.

Vocational and technical schools

Agricultural and horticultural schools. Elementary agricultural schools (*lagere landbouwscholen*) give a 4-year course. Five days a week are set aside for classes in the first 2 years, 4 in the third year and 3 in the fourth. The arrangements are much the same in the horticultural schools.

The specialized agricultural schools (*landbouwvakscholen*) aim at giving thorough specialized instruction in such subjects as dairying, poultry farming, stock breeding, flaxgrowing and agricultural mechanization. Entrance qualifications vary. For specialized horticultural schools, a diploma from an elementary horticultural school or a general horticultural course is required.

General agricultural courses (*algemene landbouwcursussen*) give instruction on the principles of agriculture, taking into account the local type of farming. The classes are held on winter evenings, with 300 periods spread over two winters. Following the general course, special courses can be taken on such subjects as farm management, agricultural accountancy, fertilizers, plant diseases, management theory and cattle feeding. The number of periods varies with the nature of the course.

Secondary agricultural schools (*middelbare landbouwscholen*) give an 18-month course covering two winter

terms consisting mainly of classroom instruction and one summer term which is mainly practical. They are primarily intended for prospective farmers. Candidates must be about 16 years of age, and have some years of secondary school and practical experience behind them.

Agricultural colleges (*hogere landbouwscholen*) give a 3-year course in which theoretical instruction is interspersed with extensive practice. The ULO diploma or its equivalent in general education is required, and there are entrance and final examinations. The course is designed for persons who will occupy positions of responsibility in large agricultural undertakings. Completion of the course qualifies for admission to the Agricultural University (*Landbouwhogeschool*) at Wageningen and the Faculty of Veterinary Science at the University of Utrecht.

At the same level are four other specialized schools (for forestry and dairying) and a number of agricultural and horticultural teacher training courses, and courses on co-operative management, poultry farming etc.

Elementary horticultural schools and courses give elementary instruction in such subjects as fruit, vegetable, flower, bulb, seed and potato growing, arboriculture, flower arrangement, horticultural techniques and garden lay-out and maintenance, while the specialized schools place the emphasis on practical training in one or more specialized fields.

Secondary horticultural education is given at the two horticultural high schools (*hogere tuinbouwscholen*), the eight secondary horticultural schools (*middelbare tuinbouwscholen*), at advanced classes for landscape gardeners and at the horticultural teacher training courses.

The responsible authority for agricultural and horticultural education is the Director of Agricultural Education at the Ministry of Agriculture.

Vocational schools for girls

Elementary vocational schools for girls (*lagere nijverheidsscholen voor meisjes*) are open to pupils who have completed 6 years' primary schooling. The basic tuition comprises general subjects (which may occupy over one-third of the curriculum) together with elementary instruction in cooking, sewing and housekeeping.

Agricultural housekeeping schools (*landbouwhuishoudscholen*) teach girls the special home economics needed for farm housekeeping. The schools are also designed for instruction in the improved facilities which are an important factor in giving rural life a wider meaning.

Advanced vocational schools for girls (*uitgebreid lager nijverheidsonderwijs voor meisjes*) are intended for girls wishing to make a further study of the various feminine vocations (home economics, etc.). Courses vary from 1 to 3 years, depending on the subjects chosen. Admission requirements also vary accordingly.

Secondary vocational schools for girls (*middelbaar nijverheidsonderwijs voor meisjes*) offer an opportunity for further specialization. Admission is open to holders of certificates from advanced vocational schools and HB schools, *gymnasia* or girls' secondary schools, and to holders of ULO diplomas.

Some of the vocational schools combine their instruction with secondary education so as to provide full training qualifying the trainee for employment as a vocational school teacher. The examinations for vocational aptitude certificates are conducted by a government commission.

Vocational schools for boys

Elementary technical schools (*lagere technische scholen*), of which there are about 200 in the Netherlands, with an average of 300 pupils each, give 2- or 3-year—or, in a few instances, 4-year—courses. Admission to a 2-year course is available to pupils who have completed grade 6 at primary school and have reached the age of 12 years and 8 months. This requirement does not apply to the courses lasting 3 years or over, where vocational or specialized education begins only in the second year. For some special trades, e.g., motor mechanics, precision engineers, trainees may remain at the school for a further year. The school may have attached departments for woodworking (carpenters, cabinet makers), metal working (fitters, smiths, brass, lead and zinc workers, electricians), house-painting; and also, as is often the case, for cycle repairing, motor and automobile repairing and for training bricklayers, tailors, shoemakers, printers, bakers and textile workers. Local needs dictate the type of departments established, but every school normally has at least a woodwork department and a metalwork department.

The apprentice system (*leerlingstelsel*) and other forms of training supplement the instruction provided by elementary technical schools, which by their nature cannot offer a complete all-round specialized education.

Under the apprenticeship system (as under the old guild system), the boys, many of whom have already attended elementary technical schools, are placed as apprentices in a workshop, where they are further initiated into the craft or speciality, and a teaching agreement, legally binding on all parties, is contracted between the apprentice, the employer and the apprenticeship board. The apprenticeship examination and the award of diplomas is governed by the Vocational Education Act. For the period of the agreement the apprentice is bound—in the evenings, if not during the day—to attend courses relating to his speciality.

This additional education is also given at elementary technical schools (evening classes covering from 6 to 9 months a year). The recent trend has been for evening classes to be replaced—thanks to the co-operation of employers—by day classes, sometimes one day a week throughout the year, and sometimes one half-day and one evening a week.

Advanced technical schools (*uitgebreid technische scholen* —UTS) are a comparatively new phenomenon, and are still at the experimental stage. The usual admission requirement is 3 years at a ULO school or 2 years at an HB school. In addition, pupils holding an elementary technical school certificate may be admitted to an advanced school after attending a 1-year preparatory class. The duration of the course is 2 years, after which 1 year's practical instruction is given under school supervision. These courses open the way to junior posts in industry.

Navigation schools train pilots and telegraphists. Admission is open to anyone with a ULO-A or B diploma.

Schools for ship and aircraft mechanics require applicants

to be in possession of a ULO-A or B diploma, or to have attended an elementary technical school and passed the entrance examination.

Sea fishery and inland navigation schools admit pupils who have completed the primary school course.

Industrial schools (*bedrijfsscholen*), based on particular branches of industry, train specialized workers. The length of courses depends on the previous education of the participants and the nature of the speciality.

Technical colleges (*hogere technische scholen*—HTS) are designed to train personnel for intermediate posts in industry, while persons holding diplomas from such schools may teach at elementary vocational schools.

HT schools contain departments for building, road and waterway construction, machine construction and electrotechnics. Some of them also have departments for shipbuilding, aircraft construction, industrial chemistry and physics, industrial economics, machine technology, metal working, and surveying.

Courses last 4 years, the third year being devoted to practical work in industry; part of this year is spent abroad in some cases, and pupils must then submit a monthly report to the school describing their activities. A teacher visits them at their work from time to time. These schools are open to pupils with a ULO-B diploma, pupils who have completed the third form of a secondary school (HB school, etc.) and have obtained good marks for the relevant subjects, and those holding an HB school B diploma or a *gymnasium*-B diploma. The latter are usually admitted to the second form of the higher technical schools. Pupils holding a diploma from an elementary technical school may be admitted after completion of a preparatory course.

Apart from the technical colleges there are other secondary technical schools, including mining schools, textile schools and schools specializing in the leather and footwear industries. The instruction given (to 2,000 pupils in 1957) is both theoretical and practical.

Higher technical education is given at technical universities (*technische hogescholen*). Apart from the teaching of further skills, the preparatory class gives general training courses.

Teachers for elementary technical schools and advanced technical schools for boys largely obtain their training at evening classes. A certificate of general education is required for admission. The course consists of a 2-year basic course, with an additional course of 1 year for teachers of practical subjects and 2 years for teachers of theoretical subjects, while a final course, lasting 2 years for evening students and 1 year for day students (with boarding facilities), may be attended in Rotterdam.

The examinations are controlled by a government commission, and a certificate of four years' actual teaching work must be submitted. The teacher employed for giving instruction in general subjects at elementary and advanced technical schools and in the corresponding subjects at elementary and the various advanced vocational schools for girls are usually holders of primary school teachers' certificates. In addition they often hold a special primary or secondary teacher's certificate.

Teachers of general subjects and mathematics, physics and mechanics at technical high schools must be in possession of the relevant degree diploma or secondary school teacher's certificate. Teachers qualified to give instruction in practical subjects may be issued with certificates giving them the right to teach at elementary or advanced technical schools. They must also have a teacher's certificate. Holders of an engineer's diploma may teach the theory of technical subjects and drawing provided they have worked as technicians in commerce and industry for a period of three years.

Full training for teachers at girls' secondary vocational schools is given at various schools of this type. Examinations for vocational diplomas are controlled by a government commission.

Teacher training schools

The training of infant school teachers and principals in public and private teachers' institutions is governed by the Infant Education Act. Admission is open to persons holding ULO diplomas, while those wishing to be principals must obtain the ordinary teacher certificate first. The course is for 2 or 4 years, depending on whether it is for the teacher or head teacher certificate, or both.

The minimum curriculum includes pedagogics and psychology, reading and story telling, Dutch language, sociology, history, biology, hygiene and child care, music, drawing, manual instruction, physical training and games.

Teachers for primary schools, including VGLO and ULO schools, are trained at public or private teacher training colleges. The courses are subdivided into three cycles, which together cover a 5-year period.

The first cycle (2 years) is intended mostly for students from ULO schools. Admission to this section may also be granted to persons successfully completing 3 years at an advanced technical school or passing an entrance examination.

The course comprises general instruction in Dutch language and literature, history, geography, physics, chemistry, biology, mathematics, French, German, English, music, drawing, handicrafts, physical training and, for girls, needlework.

The second cycle (2 years) is open to students who have successfully completed the first cycle and to anyone holding a secondary school diploma. The first cycle will probably be abolished should there be a full supply of candidates from secondary schools at some future date.

In this cycle students begin to receive teacher training proper. The course includes pedagogics and related sciences, Dutch language and literature, courses on social and cultural life in the Netherlands, reading, writing, music, drawing, handicrafts, physical training (and, for girls, needlework), teaching methods in general and specialized methods for the teaching of Dutch, history, geography, nature study, arithmetic, reading, writing, music, drawing, handicrafts, physical training and, for girls, needlework.

At the end of this second cycle, candidates sit for an examination qualifying them for a certificate of aptitude for teaching, which entitles them to teach at ordinary primary schools. But their education is not considered as being completed by the acquisition of this certificate: they are not fully qualified, and their salaries are lower than those of fully qualified staff.

The third cycle (1 year) is designed to qualify teachers fully. Only persons holding a teacher's certificate are

eligible to take the course, which includes a more advanced study of pedagogics, Dutch language and literature, and the social and cultural life of the Netherlands. Students are required to write theses on at least two educational subjects, selected with the approval of the principal. Successful completion of the final examination opens the way to appointment as teachers at advanced primary schools, special primary schools or complementary primary schools, and as principals of any type of elementary school.

Special certificates may be obtained for a number of subjects taught at primary schools. These qualify their holders to give instruction at a primary school in the relevant subject. Study for these 'sub-certificates' has been strongly encouraged by the Government and, in principle, the State pays half the fees. In addition, a bonus is granted on the award of a so-called ULO certificate.

Other specialized schools

Social welfare schools. Under this type of training comes that given to household helps and companions for aged people, training for group leaders in youth work, child welfare and educational work with children who have completed their compulsory schooling, etc. The minimum age for admission to schools of this type is 18. Courses vary in length and some of them are part-time.

Fine art, arts and crafts schools, etc. Under the heading of secondary vocational schools come the art and/or craft schools. They are usually independent, although they are sometimes housed in the same institution as a technical high school. The subjects taught include drawing, painting, modelling, sculpture, textile design, fashion drawing, commercial art, pottery, precious metal work, industrial design, etc. Admission is normally restricted to candidates holding ULO diplomas.

Out-of-class activities

At almost every secondary school a number of activities are conducted which come outside the scope of the school programme although they are closely linked with the school community. The schools often organize sporting events, for example, and form clubs for sports, theatricals, music, etc. In some cases, scout troops are attached to particular schools, although youth work of this kind is generally organized independently of the schools. This also applies to most forms of club work.

TRENDS AND PROBLEMS

The Bill on secondary education now under consideration includes a plan for the structural organization of education at this level. Once it has been passed, the intention is to follow up this legislation—and also the Infant Education Act (1955)— by similar laws covering primary and higher education. These laws, taken together, should form a comprehensive body of educational legislation for all levels.

To bring about this correlation of educational legislation, increased activity on the part of the social organizations will be essential. With strong support and recognition from the governmental authorities, these organizations should be able to work out the structural details of the new system within the framework of current legislation.

STATISTICS

Population (mid-year 1958 estimate): 11,186,000.
Land area: 12,529 square miles; 32,450 square kilometres.
Density: 893 per square mile; 345 per square kilometre.

Summary of school statistics, 1953–57. In the school year 1957/58, enrolment at all levels was over 2.7 million, which represented a school-going population equal to a fourth of the total population. Enrolment was distributed as follows: pre-primary education, 13 per cent; primary education, 54 per cent; general secondary education, 14 per cent; vocational secondary education, 15 per cent; all other levels: 4 per cent. From 1953 to 1957 total school enrolment increased by 14 per cent, enrolment in general secondary education by 35 per cent; in vocational education, by 30 per cent (female enrolment by almost 40 per cent); in training schools for kindergarten teachers, by 19 per cent.

In pre-primary, primary and general secondary education the proportion of girls remained fairly constant during the five school years under review (49 per cent in pre-primary education, 48 per cent in primary, and 47 per cent in general secondary education), whereas the proportion increased slightly in vocational education (49 per cent in 1957/58 as compared with 46 per cent in 1953/54) and in institutions of higher education except teacher-training colleges (16 per cent as against 14 per cent). On the other hand, the proportion of girls decreased in teacher training colleges (44 per cent in 1957/58 as against 49 per cent in 1953/57). (See Table 1.)

Enrolment trends in secondary education 1930–57. Table 2 gives time series, from 1930 to 1957, concerning enrolment in secondary education by type: general, vocational and teacher training. The average total enrolment for 1955–57 was almost three times that of 1930–34. In the last column total enrolment averaged over 5-year periods is related to the estimated population 15–19 years old.

It will be noted that the rate of increase of this ratio is higher during the second half of the period.

Examination results in secondary education, 1953–57. From 1953 to 1957 the increase in the number of certificates granted was less than the increase in the number of pupils enrolled, except in teacher training colleges. In the latter, enrolment increased by 19 per cent between 1953 and 1957, and by 26 per cent between 1950 and 1957, but the number of teacher training certificates granted increased by 49 per cent between 1953 and 1957. A slight increase may be seen in the number of certificates of secondary vocational schools granted to girls. In 1957 they were 45 per cent as against 42 per cent in 1953. (See Table 3.)

Educational finance, 1957. Table 4 shows that total expenditure on education for 1957 (fiscal year beginning in January) amounted to 1,577 million guilders. This represents an average of 143 guilders per inhabitant as against 62 guilders in 1952 (see *World Survey of Education II*). Funds contributed by the Central Government covered 68 per cent of the total amount; local authorities contributed 31 per cent. The total amount spent on education was distributed as follows: recurring expenditure, 78 per cent; capital expenditure, 17 per cent; debt service, 5 per cent.

NETHERLANDS ANTILLES

The Netherlands Antilles consist of the islands of Curaçao, Aruba and Bonaire, situated off the coast of Venezuela and known as the Leeward group, and three much smaller islands, the Windward group, lying to the east of Puerto Rico. The Netherlands Antilles, the Netherlands and Surinam are united on an equal basis in the Kingdom of the Netherlands. In the Netherlands Antilles, which enjoy full internal autonomy, the Government is constituted by the Governor and the Council of Ministers; the former represents the Sovereign of the Kingdom of the Netherlands while the Ministers are responsible to the elected legislature.

THE EDUCATIONAL SYSTEM

Articles 139 and 140 of the 1955 Constitution of the Netherlands Antilles refer to education, as follows:

'The dissemination of enlightenment and culture and the promotion of the arts and science are of vital interest to the Government.'

'Education is a matter of constant concern to the Government.'

'Anyone has the right to provide educational services, subject to government inspection and investigation into the efficiency and morality of the teacher.'

'Public and private schools, in so far as the latter adhere to the provisions of government legislation, are subsidized in accordance with the same scale of assessment.'

Education is regulated by the Ordinance of 1935, amended in 1944, 1951 and 1953. Under the last-mentioned amendment the Government of the Netherlands Antilles delegated responsibility for implementing educational policy to the authorities of the individual islands. It retained, however, the control of school inspection and the organization of examinations; and is jointly responsible, with the elected assembly, for educational legislation.

The supervision of both public and private schools is entrusted to an inspector, helped where necessary by assistant inspectors and school supervisors (*schoolopzieners*). All these are appointed by the Government. The inspector now acts as head of the Department of Education and is assisted by two supervisors attached to the Department. Further educational supervision on the various islands is conducted by a government board, while, in the case of the Roman Catholic schools, additional supervision is the responsibility of two diocesan inspectors. Moreover, all public schools have a committee elected by the parents, the duties and powers of which are regulated by law.

School medical services have been in existence on all the islands for many years, but no school doctors are attached to the Department of Education.

Pupils exhibiting deficiency symptoms can obtain school meals at primary schools and the attached nursery schools. Such meals, which are free, consist of bread, butter, milk and fruit.

The structure of the educational system closely resembles that of the Netherlands. Dutch is the language of instruction in the Leeward Islands, and English in the Windward Islands of St. Martin, Saba and St. Eustace; the latter, however, account for barely 3 per cent of the total school population.

TYPES OF SECONDARY EDUCATION

Secondary education, in the sense of education for young people from 12 to 18 years of age, is provided in the upper classes of continued primary and advanced primary schools, and in secondary and technical schools. These follow on from the 6 years of primary schooling proper.

Teacher training is given in special departments of the secondary schools.

Diplomas and certificates are awarded to successful candidates in the Education Department; examinations are recognized in the Netherlands, in the schools and higher institutions of which students from the Antilles may continue their studies.

Verslag van bestuur en staat van de Nederlandse Antillen over het kalenderjaar.... Gouvernments-Secretarie.

STATISTICS

Population (mid-year 1958 estimate): 193,000.
Area: 371 square miles; 961 square kilometres.
Population density: 520 per square mile; 201 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, total school enrolment (not including special education and adult education) was about 49,500, or 26 per cent of the total population. Of these pupils, 15 per cent were receiving pre-primary education, about 81 per cent were enrolled in primary schools, and 3.6 per cent in secondary schools. It should be noted that several thousand pupils actually receiving secondary education in higher (continued or advanced) primary schools were included in the figures under primary education. In the primary schools, the proportion of girls remained at about 50 per cent, and the pupil teacher ratio at 35. Between 1953 and 1957 total pupil enrolment increased 29 per cent. (See Table 1.)

Enrolment trends in secondary education, 1950–57. In 1950 there were 358 pupils enrolled in secondary and teacher training courses, excluding those receiving secondary education in primary schools. The number had risen to 801 in 1957. The number of pupils in vocational schools tripled during this period, rising from 317 in 1950 to 1,017 in 1957. Taking into consideration the pupils enrolled in continued or advanced primary schools who were actually receiving secondary education, it may be estimated that the secondary school enrolment ratio (as related to the population 15–19 years old) was about 30 for the period 1955–57.

Examination results in secondary education, 1953–57. Table 2 shows a rapid increase in the number of vocational school diplomas granted during this period, a rise from 81 in 1953 to 169 in 1957. As regards secondary school leaving certificates and diplomas of teacher training schools, some increase is noted in the last two or three years.

Educational finance, 1957. Total expenditure for the fiscal year beginning in January 1957 amounted to 16,682,627 Netherlands Antilles guilders, which represents about 88 guilders per inhabitant. Of this amount, 91 per cent was for recurring expenditure, and nearly 9 per cent for capital expenditure. (See Table 3.)

NETHERLANDS NEW GUINEA

THE EDUCATIONAL SYSTEM

The educational system in Netherlands New Guinea corresponds to the country's present stage of development. At the secondary level the emphasis is on professional and vocational training rather than on general education. The geographical expanse of the country, coupled with the low population density, makes it necessary for nearly all secondary schools to be provided with boarding accommodation.

The Protestant and Catholic missions play a prominent role in the provision of education. Funds for organizing training are also forthcoming from private undertakings or special foundations. All private schools qualify for government subsidies provided they comply with the regulations.

THE DEVELOPMENT OF SECONDARY EDUCATION

Secondary education in Netherlands New Guinea began just after the second world war, and has recently been expanding at a quickened pace.

The planning of secondary education is in the hands of the Cultural Affairs Board, with the Council for Popular Education and the education experts of the Protestant and Catholic missions acting in an advisory capacity. There is also a Teaching Materials Commission which deals with special teaching methods and the preparation of special manuals for Netherlands New Guinea.

The training of administrative officials is under the supervision of the Internal Affairs Board and is conducted by the various departments concerned. Other forms of training are in the hands of the mission bodies and inspected by the Cultural Affairs Board, or both administered and inspected by the Board.

All recognized schools are either financed entirely or subsidized by government funds. Apart from the school subsidy, the mission bodies administering schools receive a supplementary amount for administrative expenses and are responsible for paying teachers' salaries from the subsidy given. In the case of modern secondary schools (*hogere burgerscholen*) and advanced primary schools (*uitgebreid lager onderwijs* or ULO) school fees are charged on the basis of parents' incomes.

TYPES OF SECONDARY EDUCATION

Pupils completing their primary education have a choice between general secondary schools, vocational training or enrolment in a work-group giving them the possibility of further preparation through part-time instruction.

General secondary education covers the junior secondary schools (*primaire middelbare scholen*), the modern secondary schools and the ULO schools, and gives access to advanced professional training.

General secondary schools

The modern secondary and ULO schools are identical with the similarly-styled establishments in the Netherlands and have the same curricula. The curriculum for the junior secondary schools is adapted to Netherlands New Guinea's special needs, and comprises Dutch, English, mathematics, commerce, physics, biology, geography, history, drawing, physical training, handicrafts, singing.

A special class provides intensive instruction in Dutch for pupils who wish to study at a modern secondary school or an ULO school but lack sufficient mastery of the language.

Vocational and technical schools

Schools of administration. Two schools provide training for junior and senior officials respectively.

The OSIBA (for junior officials) consists of two sections: 'A' Section, with 2 years' school instruction and 1 year's practical work under the supervision of an experienced administrator; and 'B' Section, with a 2-year course. The curriculum for 'A' Section includes Dutch, English, arithmetic, geography, history, nature study, administration, typewriting and physical training, while that for 'B' Section includes Dutch, arithmetic, criminal law, State organization, political economy, ethnology, hygiene, special subjects for police officers, administration and physical training.

The Administration Institute (for senior officials), for which the condition for admission is a completed course at a secondary school, has the following curriculum: political science, public law, criminal law, civil law, ethnology, Malay, administration, typewriting, book-keeping, public health and first aid, and other selected subjects. The lessons are given by government officials.

Technical education. This is provided at elementary technical schools (metalwork and woodwork) and by part-time courses (metalwork and building) under the so-called apprenticeship system. The curriculum for the elementary technical schools comprises general education, theory of the subject, and practical work (in the proportion of 5:6:10). The curriculum for the part-time courses varies according to the form of apprenticeship and covers from 2 to 4 years, depending on the type of training, with 9 hours' instruction a week.

Training for employment in government service. This includes training for agriculture, sylviculture, medical services, navigation, meteorology, posts and telegraphs, fiscal services and accountancy. Some of these courses are full-time and others part-time. In the full-time courses, half of the available school time is usually devoted to practical exercises. The teaching staff consists mainly of officials of the government services concerned.

Teacher training schools

The 3-year training schools (*opleidingsscholen*) are designed to meet the ever-growing demand for teachers for the village schools.

The curriculum comprises education, Dutch, arithmetic, geography, history, civics, nature study, hygiene, music, drawing, writing, Malay, handicrafts, gardening and physical training.

Teacher training courses (*normalisten cursus*) train teachers for urban and continuation schools (*vervolgscholen*), the course lasting 3 years for pupils holding village teacher's diplomas and 2 years for pupils who have completed their education at junior secondary schools. The curriculum for these courses includes education, Dutch, arithmetic, geography, civics, history, State organization, natural history, hygiene, Malay and English.

TRENDS AND PROBLEMS

A superstructure of secondary education adapted to Netherlands New Guinea is to be created within the not too distant future. In consequence, a training college is to be opened as soon as possible to train teachers capable of replacing the European teaching staff.

The continued absence of a university and of a sufficient number of vocational schools is at present met by sending

qualified trainees to the Netherlands at the expense of the Government and other bodies.

STATISTICS

Population (mid-year 1958 estimate): 700,000.
Area: 159,375 square miles; 412,781 square kilometres.
Population density: 4 per square mile; 2 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, total enrolment was over 50,000 which represented about 7 per cent of the total population. This does not include persons attending adult education courses. (See Table 1.)

Educational finance, 1957. Central Government funds covered almost the total expenditure on education; recurring expenditure made up 98 per cent of the total. The cost per pupil (recurring expenditure only) was 170 guilders in 1957/58 as against 150 in 1954/55. (See Table 2.)

5. Not including expenditure on public school buildings.

SURINAM

THE EDUCATIONAL SYSTEM

As regards education, Surinam is entirely independent of the Kingdom of the Netherlands, although there is still a close resemblance between the school systems of the two countries.

The Surinam system comprises three stages: kindergarten and primary education for children up to about 13 years of age; secondary, up to about 18; and semi-university, higher technical and adult education. Education is compulsory from 7 to 12 years of age. The primary school course is normally 6 years but may last 7 years in schools for children from a non-Dutch speaking environment. On completing this course, pupils have a choice between the 2-year continued elementary schools, the home economics school for girls, the 4-year advanced elementary schools (*meer uitgebreid lager onderwijs* or MULO) and the technical school; for each of the two last-named schools there is an entrance examination. Girls completing a continued elementary school may take the infant teachers' course at the Training College. There is also an elementary agricultural school for pupils aged 15 and over. After the third year in a MULO school pupils may enter the training college or, on their passing an entrance examination, the secondary school (*algemene middelbare school*—AMS). Beyond this level there are various vocational courses, as a rule part-time, two institutes of semi-university status, the Medical School and the Law School, and the possibility of study overseas. There is elaborate legislation on matters relating to primary education. For other levels and types and schools, which are mostly of recent date, provisional arrangements have often been made. The heterogeneity of the population —with the various groups speaking their own language, while the official medium is Dutch—is a complicating factor in teaching.

The Minister of Education and Popular Culture is assisted by the Director of Education, who is the head of the Department. The latter is responsible for supervising the quality of instruction and distributing the moneys made available for education, including subsidies to private schools.

THE DEVELOPMENT OF SECONDARY EDUCATION

Continued elementary education started in 1816 and advanced elementary in 1909. The technical school has been in existence for 75 years but was reorganized in 1950, the year in which the secondary school was opened. The training college started as a day school in 1949.

Legal measures are in preparation and have already been partly put into effect. No education at secondary level is at present covered by compulsory attendance requirements.

The curricula for the various types of school are laid down by the Department of Education in consultation with the staff of the schools in question. The technical and home economics schools have in addition a supervisory board and a committee, respectively, which act in an advisory capacity.

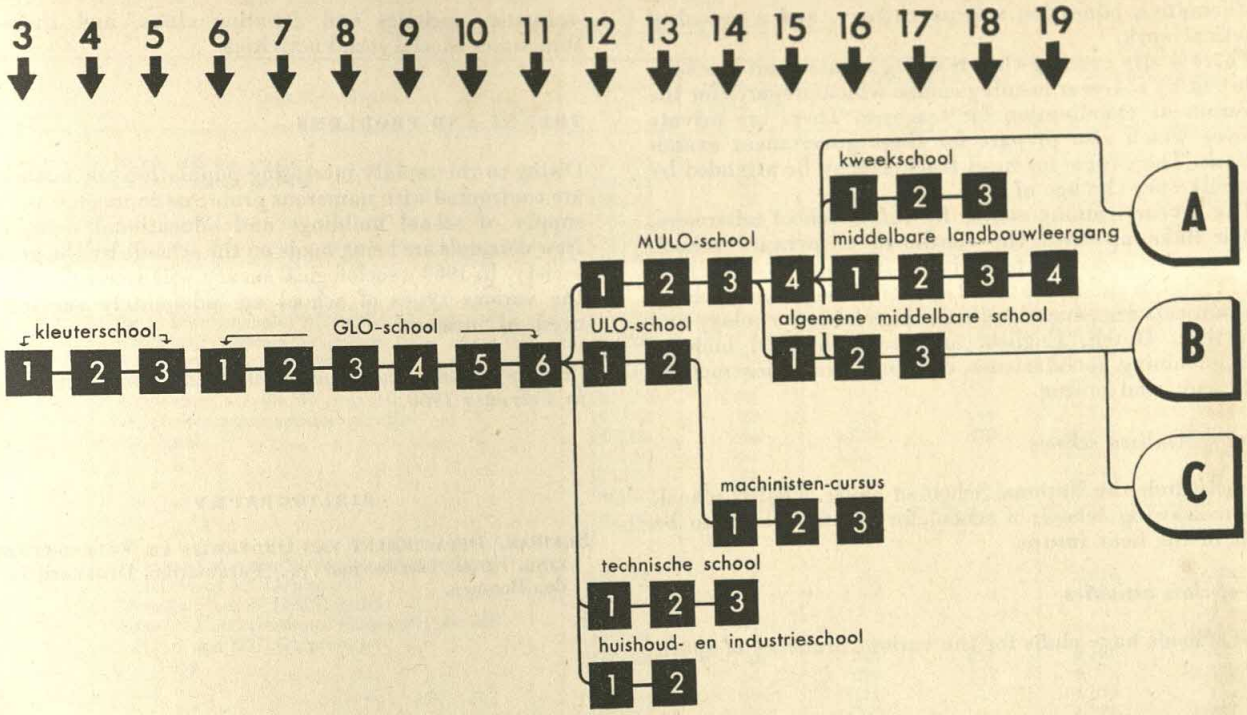
The primary school inspectors also inspect the continued and the advanced elementary schools. The Chief Inspector inspects the other schools with the exception of the secondary school (AMS), which is inspected by the Director of Education. There is no special inspectorate yet for secondary education but it is expected that some such provision will be made in the near future.

Financing is by means of government grants, which are paid directly to the public schools and indirectly to the private schools. Teachers' salaries are paid according to the Public Service scale.

The school year begins on 1 November and ends on 31 October. Holidays are given at Christmas, Easter and Whitsun, and the long vacation is from the middle of September to 1 November. Each class has about 23 hours' tuition a week (more in the technical school), usually distributed over 5 or 6 days.

General secondary schools

Continued elementary schools offer a 2-year course after the sixth class of the elementary school. Besides the elementary school subjects, simple book-keeping and commercial arithmetic are taught.



Advanced elementary schools have a 4-year course divided into two parallel sections, A and B. Pupils continue with the subjects taught in elementary school and take certain additional subjects; in the A section these are commercial science, English, French and Spanish, and in the B section mathematics, physics, English, French or Spanish, and German. The course leads to a final examination. Progress reports are sent to parents.

The secondary school (AMS) has four sections: A, B, C and D. Sections C and D are more in the nature of vocational training courses. Admission to A and B is by means of an entrance examination after at least 3 years of advanced elementary education. Both sections offer preparatory scientific training which gives admission to universities in the Netherlands. The A section has as its main subjects commercial science and foreign languages; the B section, mathematics, physics and other sciences.

Vocational and technical schools

The technical school gives 3 years' training. The sections are carpentry, brick-laying, painting, fitting, electricity, motor-repairing. In addition, pupils study general subjects. Evening classes are organized for those who are already working.

The home economics school offers a 2-year course in subjects such as cooking, sewing, laundry, child care, etc.

GLOSSARY

algemene middelbare school: upper general secondary school with two streams, one emphasizing modern languages and commercial subjects, the other mathematics and physical science.

GLO-school (elementary school): primary school of three kinds—GLO-A for Dutch-speaking children, GLO-B for non-Dutch-speaking children and District-GLO for rural children.

huishoud- en industrieschool: vocational training school of home economics.

kleuterschool: pre-primary school.

kweekschool: teacher-training school.

machinisten-cursus: vocational training course for machinists.

middelbare landbouwleergang: vocational training school of agriculture.

MULO-school (advanced elementary school): lower secondary school with two courses, general and commercial.

technische school: vocational training school for boys.

ULO-school (continued elementary school): two upper classes attached to primary school giving pre-vocational training.

HIGHER EDUCATION

A. *Rechtsschool:* law school.
B. *Geneeskundige school:* medical school.
C. University study abroad.

There are also special evening classes attached to this institution.

The elementary agricultural school admits pupils aged 15 and over and gives a mainly practical course in farming.

Sections C and D of the AMS school, which were begun only recently, provide courses emphasizing training for managerial and administrative careers. In the C section commercial science is preponderant. In the D section correspondence in foreign languages, typewriting and shorthand are the principal subjects.

In addition to these schools special classes are organized by the various government departments, for example: a 3-year course for training nurses, linking up with the continued elementary school, courses for laboratory workers and analysts, customs officers, policemen (lower and middle ranks), and supervisory staff of the Department of Public Works and Traffic. There is also a special course at the Law School based on the advanced elementary school, for certain administrative posts.

Evening classes are also conducted by private persons. Thus there is a private school for training in inland and coastal navigation, training courses for office staff, etc. Moreover there are a number of young people who study by means of correspondence courses most of which come from the Netherlands and the United States of America.

Teacher training schools

The Surinam Training College has a 3-year full-time course for primary teachers. The entrance requirement is 3 years of advanced elementary education. The programme comprises reading, writing, arithmetic, Dutch, history, geography, biology, singing, drawing, manual instruction, hygiene, gymnastics, English and another foreign language,

mathematics, education and psychology, and a period of practical work.

There is also evening-class training for assistant teachers, followed by a 4-year evening course which prepares for the government examination for teachers. There are private courses which also prepare for these government examinations. The course for head teachers may be attended by teachers over the age of 18.

The 4-year training course for infant-school mistresses, which links up with the continued elementary school, prepares for a certificate entitling its holder to teach at infant schools and in the first 2 classes of the primary school. The subjects are education (including child psychology and didactics), Dutch, English, arithmetic, history, biology, speech training, social science, drawing, manual instruction, child care, and sewing.

Other specialized schools

These include the National School of Music, a ballet school, and a drawing school; a school for plastic arts is to be built in the near future.

Out-of-class activities

Most schools have clubs for the various branches of sport, dramatics societies and debating clubs, and there are sometimes special social activities.

TRENDS AND PROBLEMS

Owing to the rapidly increasing population the authorities are confronted with numerous problems connected with the supply of school buildings and educational equipment. New demands are being made on the schools by the growing society. In 1960 a sociological survey will ascertain whether the various types of school are adequately serving the needs of Surinam.

STATISTICS

Population (mid-year 1958 estimate):[1] 267,000.
Area: 55,144 square miles; 142,822 square kilometres.
Population density: 4 per square mile; 2 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, total school enrolment (not including vocational schools other than the public technical school) comprised 61,500 pupils, or 23 per cent of the total population. Of these pupils, 14 per cent were enrolled in infant schools, 74 per cent in primary schools, 9 per cent in general secondary education and the rest in teacher training and higher education. Except for the technical school attended only by boys, the numbers of boys and girls were about equal at each level of education from pre-primary through secondary. At the higher teacher training college, the proportion of girls was 43 per cent, in the medical and law schools together only 11 per cent. Women teachers made up 53 per cent of the teaching staff in primary schools, 47 per cent in secondary schools. The pupil-teacher ratio was 36 in primary schools, 22 in general secondary schools, 34 in the technical school and 12 in the teacher training school. Between 1953 and 1957, total school enrolment increased by about 20 per cent. (See Table 1.)

1. Including Indian and Negro populations living in tribes, estimated at 26,000 in 1950 and 1958.

Enrolment trends in secondary education, 1930–57. Between 1930 and 1954, enrolment in general secondary schools (MULO and AMS) increased threefold, though the proportion of girls showed some decline. For the period 1955–57, with further increasing enrolment, the proportion of girls again reached 45 and 47 per cent. Average total enrolment at the secondary level then amounted to about 29 per cent of the estimated population 15–19 years old. (See Table 2.)

Examination results in secondary education, 1956–57. In 1956 and 1957, the numbers of certificates granted were as follows:

Certificate	1956/57		1957/58	
	Total	Female	Total	Female
Final examination in continued elementary schools (ULO) . .	314	161	350	150
Final examination in advanced elementary schools (MULO) . .	346	148	300	120
Final examination in secondary schools	39	7	49	12
Technical school diploma . . .	68	–	124	–

1. From 1954/55, not including private schools for restricted elementary education of Amerindians and bush Negroes ('Bushland schools') which provide education lower than that of the first level. Data are as follows: 1956: 1,220 pupils; 39 teachers. 1957: 1,324 pupils; 44 teachers.
2. In 1953/54, continued elementary schools (ULO) are included with 'primary'.
3. Including part-time teachers.
4. Including part-time teachers as follows: 1957/58, 7; 1956/57, 5; 1955/56, 8; 1954/55, 8.
5. Including part-time pupils as follows: 1957/58, 295; 1956/57, 326; 1955/56, 246; 1954/55, 315.
6. Including agricultural and domestic science schools.
7. Including higher teacher training.
8. Public schools only.
9. Included in secondary teacher training.
10. Law school only.

3. Public schools only.
4. Technical school only, not including agricultural and domestic science schools.

THE EDUCATIONAL SYSTEM

New Zealand was founded by settlers who, in the main, were British and to this day its people are predominantly of British stock; ethnic, linguistic and cultural ties with the United Kingdom have always been particularly strong. The educational pattern is thus basically British but has been modified, often radically, to fit the changed conditions of a new country. In recent years, too, American influence is clearly discernible. As a result of economic, social and historical factors New Zealand has been noted for fifty years for its egalitarian tendencies, for the high degree of democratic participation of its people in community affairs and for its widespread development of social services, foremost among which is a system of public schools that provide free primary and secondary education from 5 to 19 years of age for every child who wants it, and university education which is virtually free to every young person who possesses the entrance qualification.

Public education in New Zealand, exclusive of the universities, is administered centrally by the Department of Education and locally, for the primary schools, by the 10 regional Education Boards elected by the school committees of the various primary schools within the district. Historically the tendency has been for the final power and responsibility to shift from the school committees to the Education Boards, and from the Education Boards to the Department, but the whole of the machinery of local administration has been retained and local interest in education remains firmly entrenched.

Apart from a few technical schools which are under the control of Education Boards, secondary,[1] technical and combined schools are administered by local Boards of Governors or, in the case of technical schools, Boards of Managers, that are quite independent of the primary school Education Boards and deal directly with the Education Department. These Boards controlling post-primary schools (one or several schools in the same town) are made up of representatives of the parents of pupils, of local bodies and Education Boards, and, in the case of technical schools, of employers and employees in local industries. In some cases there are representatives appointed by the Government.

Approximately 12 per cent of primary pupils and 18 per cent of post-primary pupils attend private schools, the majority conducted by the Roman Catholic Church. These receive no grants from state funds but certain state services are available to them.

The University of New Zealand, although largely financed by the State through the Department of Education, is an autonomous body.

The structure of the school system is shown in the diagram on page 877.

Legally every child in New Zealand is required to attend school between the ages of 7 and 15 years, but, in fact, most begin their schooling at 5 and continue it beyond the permissible leaving age. Increasing numbers of children spend 1 or 2 years prior to entering primary school attending free kindergartens or nursery play centres controlled by voluntary associations but assisted by the State. Children normally spend 8 years in the state primary schools. The primary course covers a 2-year infant school (primers 1 to 4), followed by 4 classes known as standards 1 to 4, and a further 2 known as forms 1 and 2. The 2 upper classes (forms 1 and 2) are sometimes organized separately as an intermediate school.

Pupils leave the primary system at about the age of 13 without sitting any external examination, and go to either a secondary school, a technical high school, a combined school or, in the relatively isolated rural areas, a district high school. All technical schools, and many secondary schools, offer evening classes, particularly in practical and vocational subjects. Apprentices in many trades are required to attend certain evening classes as part of their training, and an increasing number are given leave from work to attend special day classes conducted by the technical schools. For pupils remote from school transport the Correspondence School, which has both primary and post-primary divisions, provides courses in all the usual school subjects.

After 3 years of post-primary education (forms 3 to 5) pupils may sit the School Certificate examination; if successful they pass into form 6 where they may be accredited for University Entrance by the principals of most post-primary schools. Those not accredited may sit the external University Entrance examination. Pupils who really intend to go on to university usually spend an additional year in the sixth form.

Special arrangements are made for the education of certain groups of children. Maori children may, and largely do, attend the ordinary public schools but in certain areas there are Maori schools specially designed to meet the needs of Maori pupils. Separate provision has also been made for handicapped children–those suffering from cerebral palsy, the blind, the deaf, the backward and the delinquent.

THE DEVELOPMENT OF SECONDARY EDUCATION

Educational policy in New Zealand, with its underlying philosophy, is best summed up in the official statement

1. In New Zealand, the three stages of education are usually known as primary, post-primary, and higher education. The word 'secondary' is also commonly used to describe everything pertaining to the second stage of education, so that 'post-primary' and 'secondary' used in this sense are synonymous. Through early historical associations the word 'secondary' is, however, often used in New Zealand in a narrower sense to describe the particular type of academic education given at the second stage. The context should make it clear when 'secondary' is being used in its generic and when in its restricted sense.

that 'The Government's objective, broadly expressed, is that every person, whatever his level of academic ability, whether he be rich or poor, whether he live in town or country, has a right, as a citizen, to a free education of the kind for which he is best fitted, and to the fullest extent of his powers'. The measures taken to achieve this objective provide the key to understanding the development of post-primary education in New Zealand.

The first secondary schools established in the middle of last century followed traditional English models of that period and catered only for the children of well-to-do parents. In 1900 they were still a privileged group. They were endowed from public funds, they charged fees and were completely free of state control. Only about 10 per cent of children leaving primary school attended secondary schools. The curriculum was based on that of the English grammar schools on which they were patterned—English, French, Latin, Greek, mathematics, a science and history or geography. It was basically preparatory for the university and the University Entrance examination was the admitted goal for all pupils.

The problem, then, was to bring the secondary schools within the orbit of the State, to increase the opportunities for attendance at secondary schools and to adapt the curriculum to the needs of a vastly augmented secondary school population. By various means progress was made.

In 1879 the first 'district high school' was established in Otago by adding a post-primary top to a primary school, and this type of institution proved very successful in bringing post-primary education to pupils in rural communities.

Technical high schools were established in 1914; before this they were day technical schools attached to the evening classes that had grown up to provide mechanics with training in their special skills. The day schools were intended to give the basic general training needed by the young tradesmen. They became very popular as they provided a general education of a non-academic character, something that could not be obtained at that time at a secondary school.

Combined schools were formed by the amalgamation of a technical and a secondary school in a provincial town.

Free places were instituted, and secondary schools induced by special capitation grants to provide them. By 1914 all state post-primary schools were obliged to give free places for 2 years at least to any pupil who had passed the Proficiency examination at the end of his primary school course. In 1936 the Proficiency examination was abolished, and free post-primary education to the end of the year in which he reached 19 years of age became available to every child.

A direct effect of this movement towards free post-primary education was that the Department began to exercise an increasing degree of control over the secondary schools. The Education Amendment Act 1920 authorized the establishment of New Zealand staffing and salary scales for post-primary schools, and instituted the system already operative in the case of the Education Boards of paying over to the schools the exact sum required for salaries plus a capitation grant for incidental expenses, less the amount received from local secondary-school endowments. This, in effect, nationalized these endowments, and spread more evenly the benefits resulting from the foresight of the early settlers. As from 1 April 1949 all revenue received by the schools was handed over to the Crown and the total cost of salaries and incidental expenses met from the Consolidated Fund. The endowment reserves themselves were vested in the Crown as from the beginning of 1950.

Thus by 1936 the first two objectives had been reached. A reasonable measure of state control of secondary schools had been achieved, while retaining the initiative of a considerable local control. Complete freedom of entry from the primary to the secondary schools had been established and in fact 60 per cent of those leaving primary schools now passed to secondary.

GLOSSARY

contributing school: primary school from which pupils of the senior division (usually forms 1 and 2) have been removed to an *intermediate school* or to the *intermediate department* of a secondary school.

correspondence school: an institution providing correspondence courses covering primary and secondary education for children living in isolated areas or invalid children.

dental nurses' school: vocational training school for staff in state dental clinics for school children.

district high school: complete rural primary school with secondary department attached, some of these schools being Maori district high schools.

full primary school: school providing complete primary course (*infant department*, followed by standards 1 to 4 and forms 1 and 2).

infant department: first two years of primary school course, usually comprising four primer classes.

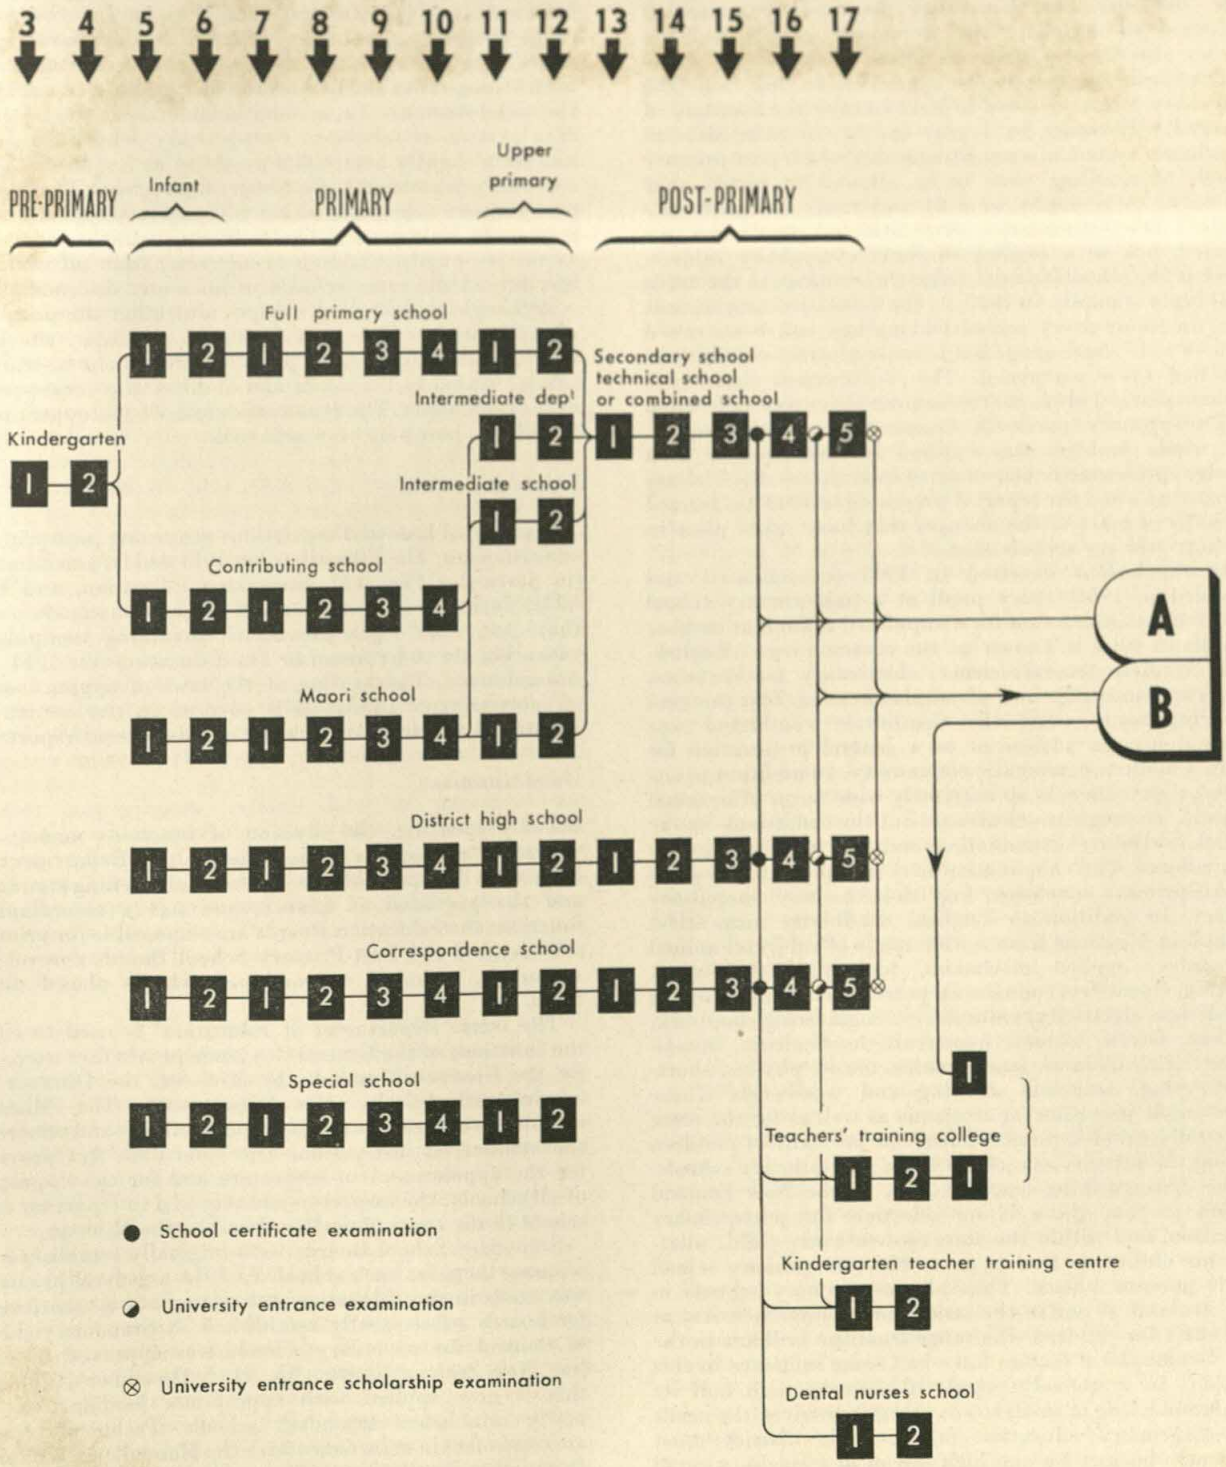
intermediate department of secondary school: see *intermediate school.*

intermediate school: upper primary school existing either as a separate institution or as a department attached to a secondary school.

kindergarten: pre-primary school.

kindergarten teacher training centre: State-subsidized training course for teachers in pre-primary schools.

Maori school: primary school, chiefly for Maori children, controlled by Department of Education; may be either *full primary school*, *contributing school* or *district high school.*



secondary school, *technical school* or *combined school:* secondary school offering general and vocational courses, the emphasis varying from school to school.

special school: either a separate institution or special classes attached to a primary school providing primary education for physically or mentally handicapped children.

teachers' training college: institution providing teacher training courses at two levels, post-secondary and post-graduate.

A. Post-secondary vocational and professional training at institutions other than universities.

B. Universities.

The problem of reorganizing the curriculum was proving more difficult. The University Entrance examination continued to dominate the secondary schools and the courses offered were quite unsuited to the needs of the vast majority of the pupils. However, at this stage the University Senate decided in 1942 to raise the standard of University Entrance by 1 year and at the same time to introduce a system of accrediting under which post-primary schools of standing were to be allowed to certify that certain of their pupils were fit and ready for university studies. The examination remained for pupils not accredited, but with English the only compulsory subject. This left the schools freer to tailor their courses to the needs of all types of pupils. In 1920, by the Education Amendment Act, the compulsory school leaving age had been raised from 14 to 15 years of age but because of various difficulties this had been postponed. The Government desired to implement it in 1944 so that a comprehensive reconsideration of post-primary curricula became increasingly urgent. The whole problem was referred by the Minister to a widely representative consultative committee—the Thomas Committee—and the report it presented in 1943 has formed the basis of most of the changes that have taken place in the post-primary schools since.

By regulations gazetted in 1945 (consolidated and amended in 1954) every pupil at a post-primary school must receive instruction for a stipulated minimum number of units in what is known as the common core—English, social studies, general science, elementary mathematics, music, arts and crafts and physical education. This common core represents what the Committee considered was essential for the adolescent as a general preparation for life in a modern democratic community. In addition to the common core there is an extremely wide range of optional subjects. The regulations also set out the conditions for the School Certificate examination and the prescriptions for each subject. The examination may be taken after 3 years of post-primary education. English is the only compulsory subject. In addition to English, candidates may select either 3 or 4 options from a wide range of subjects: animal husbandry, applied mechanics, biology, book-keeping, clothing, chemistry, commercial practice, dairying, drawing and design, electricity, embroidery, engineering shopwork, German, Greek, history, homecraft, horticulture, human biology, Latin, Maori, mathematics, music, physics, shorthand-typing, technical drawing and woodwork. These make ample provision for academic as well as for the more practically minded pupils. Today 95 per cent of children leaving the primary schools go on to post-primary schools.

The distinguishing feature, then, of the New Zealand system is that there is no selection for post-primary education, and within the state system every child, whatever his ability, is free to go to the post-primary school of his parents' choice. Thus all post-primary schools in New Zealand, if not in the strict sense comprehensive, at least cater for children who range from the brilliant to the dull. Geographical factors have had some influence in this decision. In a sparsely populated country with half its population living in small towns or rural districts, the needs of post-primary education for a whole district must frequently be met by one high school or even by a small secondary department attached to a primary school, so that a comprehensive school is the inevitable solution. Moreover, in New Zealand there has never existed the range of social and economic differences that characterizes many older countries, and the conception of class has never been strong. Thus the democratic and egalitarian nature of the social structure was an additional factor in the rejection of a system of selection. Post-primary schools range in size from slightly over 1,000 pupils to as few as 25 in the secondary department of a district high school. The typical post-primary school has about 650 pupils. Great attention is given to making education as freely available to country as to city pupils. Children of all races, from all walks of life, attend the same schools without any discrimination.

Although New Zealand escapes altogether the problems of selection faced in most European countries, she does face difficulties inherent in providing within one institution courses suited to the needs and abilities of a cross-section of the community. The democratic ideal of equal opportunity for all has, however, been achieved.

Legal basis

The principal laws and regulations governing post-primary education are: The Education Act 1914 and its amendments (in particular Part VII, Secondary Education, and Part VIII, Technical Education); and Regulations made under that Act. The legal provisions governing compulsory education are to be found in The Education Act 1914 and Amendments. The bearing of the laws of apprenticeship on post-primary education is covered in the section on vocational and technical schools of this present report.

Administration

Broadly speaking, the division of functions among the education authorities is as follows: the Department of Education is responsible for professional teaching standards and the provision of finance, and has a co-ordinating function; the Education Boards are responsible for primary schools; and the Post-Primary School Boards control the secondary, technical or combined schools placed under them.

The term 'Department of Education' is used to cover the functions of the Central Government whether exercised by the Governor-General, the Minister, the Director or, administratively, by the Department. The Minister establishes or recognizes post-primary schools and prescribes the syllabus of instruction. The Education Act provides for the appointment of inspectors and for the inspection of all schools; the inspectors are required to report on each school to the controlling Board and to the Minister.

Secondary School Boards were originally established by separate Acts for each school. In 1914 a general provision was made in the Education Act setting out a constitution for boards subsequently established. A Standard Scheme of Control for secondary schools was approved in 1928 (see *New Zealand Gazette*, No. 91, 6 December 1928) and this is now applied with appropriate modifications to newly established secondary schools. Technical schools are controlled in accordance with the Manual and Technical Instruction Regulations 1925.

The Scheme of Control of the school defines the powers

of the governing body and of the principal. The most important relevant provision makes the controlling board fully responsible for control and management of the school and the supervision of all its concerns and property, subject to the provisions of the Education Act and of the Scheme itself. The board has full power to appoint, suspend and dismiss teachers subject to the provisions of the Education Act and Regulations, and may make Regulations to cover any matters not otherwise provided for.

Subject to the general direction of the board the principal is in charge of the buildings and premises of the school and the furniture and apparatus. He is the final authority with regard to the discipline of the pupils, and may suspend a pupil from attendance until the board comes to a decision in the matter. He makes regulations concerning textbooks, methods and organization, and has power to recommend the appointment or dismissal of teachers and to allot them their duties. He must be consulted before appointments are made and may suspend a teacher for grave neglect of duty, pending a decision by the board. All these powers of the principal are held subject to the general power of the board. The programme of each pupil is determined by the principal after consultation with his parents or guardians. The prescribed courses of study at post-primary schools are set out in regulations under The Education Act, namely, The Education (Post-Primary Instruction) Regulations 1954. Regarding matters not therein prescribed the controlling boards have the power to determine the courses of study of the pupils, although, in practice, this power is almost invariably delegated to the principal. The Board of Managers of a technical school has a status and powers similar to those of a secondary school Board of Governors.

Most post-primary schools have a parent-teacher association which raises funds and takes an interest in the general welfare of the school. Such associations have no legal status but by fund-raising and through discussion with the principal and staff they unofficially exert some influence on the school. They can also be of the greatest value in fostering local interest in and knowledge of the work done in the school.

Supervision and inspection. Today (1960) there are 38 inspectors of post-primary schools under the control of the Chief Inspector and working in four districts. They are recruited from among outstanding teachers in grade V, which is the top grade, and, with rare exceptions, they are university graduates with good degrees and sound teaching experience in post-primary schools. Their duties are many and varied. They grade annually all post-primary teachers. They inspect all post-primary schools at intervals of three or four years and submit reports designed to give a clear assessment of the whole work of the school, including information concerning the staff, organization, buildings and equipment, and grounds, as well as information about the work being done in the various subjects. The inspectors also act as an agency for collecting and disseminating new ideas and teaching methods among teachers throughout the country. They take an active part in the organization and work of refresher courses and give valuable advice and assistance in teacher training. They also visit private schools to ensure that satisfactory standards of work are maintained. The assessment of standards of work in form 6 in all post-primary schools is another of their important duties, particularly the work in the upper sixth in connexion with the award of Higher School Certificates. In addition several inspectors have been assigned special duties in connexion with teacher recruitment, technical classes and manual training, examinations and studentships, and the teaching of mathematics and science.

Finance. The Central Government provides all the funds required for the establishment, operation and maintenance of state secondary schools, and has also provided a considerable portion of the finance required to establish school hostels attached to some of the schools, although some part of the funds for these activities has been provided by the various controlling authorities of the schools, in the form of loans, bank overdrafts, etc. A certain amount of finance is raised by the schools themselves, from parents' contributions or school functions, to provide additional amenities such as swimming baths and sports pavilions. In some cases funds raised for these purposes attract a subsidy from the Central Government. In addition to the state secondary schools there are a number of denominational secondary schools run by various church organizations. These schools receive no direct financial assistance from the Government towards buildings, maintenance or operational costs.

Funds provided by the Government are appropriated by Parliament each year as part of its overall finances and are distributed to the schools by the Education Department in two ways: (a) by making grants to the schools for specified purposes; (b) by refunding to the schools the sums paid out for various purposes.

Types of expenditure covered by (a) comprise administrative costs, class materials, libraries, heating, lighting, cleaning, maintenance of grounds and general running expenses. Expenses covered on a refund basis, i.e., under (b), include salaries and allowances of teachers, erection of buildings, initial supply of equipment, maintenance of buildings, wages of caretakers and groundsmen, transport of pupils, boarding allowances for eligible children and cost of school textbooks.

The Central Government meets the full cost of new buildings and of the initial supply of equipment to schools. It also meets the cost of maintaining buildings and the cost of additional equipment required for new courses and extended syllabus requirements. The schools themselves have to provide, from the general grant given for running expenses, any sums required for the replacement of equipment. Post-primary teachers are employed and paid by the individual controlling boards, but their salaries and conditions of service are fixed on the national basis and the money spent for this purpose is refunded to the board by the Central Government.

Post-primary education is free to all pupils up to the age of 19 years and everyone, irrespective of age, is entitled to 5 years of free post-primary education. Broadly speaking, education is divided into two groups: (a) normal day classes, (b) evening or continuation classes. As a general rule no fees are payable for ordinary day classes. For evening and continuation classes a small registration fee of 5 to 10 shillings is charged, and most schools charge for materials used. Where pupils have exhausted their free

period of education a fee becomes payable; this begins at from 30 to 60 shillings for one evening per week and increases to from 70 to 180 shillings for five evenings per week. The board controlling the school attended by such pupils has power to remit these fees.

New Zealand is noted for its advanced social services, and considerable assistance is given to parents in connexion with post-primary education. The child allowance of 15 shillings per week is extended beyond the normal 16 years of age and paid to parents throughout the child's attendance at post-primary school. Free textbooks are provided, and free transport for all pupils living more than 3 miles from the nearest post-primary school. If there is no suitable transport a boarding bursary is available. Bursaries are also available to permit pupils in a district high school to take a sixth-form course in one of the larger post-primary schools approved as an accrediting school. Technical bursaries are available to allow country pupils to follow technical courses at schools in the larger centres. Free milk is distributed daily to all pupils who desire it and free dental service and medical inspection are available.

Buildings and equipment. Great attention is given to the buildings and grounds of post-primary schools in New Zealand, which are a matter for intense public pride. Regulations governing post-primary schools are laid down in the Post-Primary Buildings Manual, which also includes the Basic Equipment List, describing the equipment provided in newly established schools.

The typical modern co-educational post-primary school, to accommodate 800 pupils, is built in four blocks and comprises: administration offices, assembly hall, gymnasium, 15 general classrooms, 4 science laboratories, 2 art and craft rooms, commercial room, typing room, homecraft room, dressmaking room, woodwork shop, metalwork shop, drafting office, geography room and music room. Each general classroom to accommodate up to 35 pupils has a floor space of 600 square feet. The total area is just over 50,000 square feet, with teaching space occupying 60 per cent, administration 6 per cent, circulation 11 per cent, sanitary, storage and ancillary 18 per cent, and walls 5 per cent. Good bilateral lighting is provided and a steady temperature is maintained in all rooms, usually by means of central heating. High standards of sanitation are insisted upon.

School welfare services. Medical, dental and other forms of assistance have been referred to under 'Finance'.

Principals and senior teachers, because of their long experience, are well fitted to cope with most behaviour problems that arise. There are, however, supporting services of the Department of Education available to advise principals and their staffs and to supplement their work in unusual and complex cases. The services of 'visiting teachers' are available to post-primary principals particularly in the case of the junior forms, where the transition from primary to post-primary school is often a critical period. The Department's psychological service is also available for the examination of unusual cases and for advice on remedial action. There is also the Child Welfare Division of the Department, which deals with delinquent children and those brought to its notice as needing special care and attention. Since 1943 the Department has assumed full responsibility for the vocational guidance of pupils at post-primary schools. Centres have been set up in 6 towns and the Vocational Guidance Officers, acting in conjunction with the principal and the careers teachers in each school, offer their services at any point in the child's career where a choice has to be made, whether of school courses or vocation.

TYPES OF SECONDARY EDUCATION

Every child is free to go to the post-primary school of his choice, except that some measure of zoning has been necessary in the large cities. The basic pattern for New Zealand post-primary schools, no matter what the school is called, is the multilateral or comprehensive type. The nomenclature is rather confusing, but the terms 'high school', 'college', 'grammar school', etc., have no particular significance, the name of the school reflecting only its historical origin, or an accident of regulations or the whim of the local people. The selection of a post-primary school is therefore usually not a question of choosing the type of school but rather the course within the individual school. Ample help is given to the pupil or parents, firstly by the staff of the primary school, and, upon enrolment, by discussion with the principal. In the great majority of post-primary schools specially appointed careers advisers are also available to provide guidance.

The school year is organized in three terms. Schools must open for a minimum of 380 half-days each year. Actual dates for 1959 were: first term, 3 February to 8 May; second term, 26 May to 21 August; third term, 15 September to 15 December. Within these terms, Good Friday, Easter Monday, Easter Tuesday, Queen's Birthday, Anzac Day, Labour Day, and the Anniversary Day of the province in which the particular school is situated are public holidays. The teaching week is of 5 days, Monday to Friday, with a minimum teaching time of 25 hours, though in practice it varies from 25 to 27 hours.

General secondary schools

In New Zealand the post-primary schools are classified as follows in 1960: secondary schools, 102; technical schools, 41; combined schools, 7; district high schools, 98; total, 248. Over the years, this classification has lost a great deal of its significance. The difference between a secondary school and a technical school is much slighter in New Zealand than in the heavily industrialized countries. Except for their part-time classes, technical schools are pre-vocational in character and most of them now offer nearly all the courses available at a secondary school, in addition to their own courses leading to trades. On the other hand many secondary schools, particularly those in provincial towns, have developed pre-trade courses in order to meet local demands that could be met in no other way. In the metropolitan centres, however, there are real differences between technical and secondary schools, the technical school attracting a considerable proportion of the non-academic, short-course pupils.

The district high schools serve the needs of a country

district, but their courses are of necessity somewhat restricted because of their small enrolment. Use is made of the Correspondence School to provide additional subjects.

Combined schools are in actual fact multi-course schools, in no way different from the many other schools classified as technical or secondary.

The position would be greatly clarified if the term 'technical' were restricted to the few large city schools engaged wholly or at least largely in the more advanced technical work.

Apart from the type of work they do, schools can be classified as 'co-educational' or 'single-sex'. At the present time all technical schools and all district high schools are co-educational, 6 of the 7 combined schools are single-sex, while 64 secondary schools are co-educational and 38 are single-sex.

The Correspondence School provides educational facilities for children and adults who cannot obtain instruction locally. Of the school's 4,000 secondary pupils about three-quarters are part-time students; that is, they are in employment during the day and study at night-time, either to improve their academic status by gaining certificates and passing examinations, or to benefit themselves culturally. Because of the numbers, a wide variety of courses is available.

Post-primary schools do their best to ensure that all pupils, irrespective of their varying abilities and occupational ambitions, receive a comprehensive and well-balanced education, which aims firstly at the full development of the adolescent as a person, and secondly at preparing him for an active place in New Zealand society as worker, neighbour, homemaker and citizen.

As mentioned above, all post-primary schools are required to teach a common core of subjects, namely English, social studies, elementary mathematics, general science, music, art and craft and physical education. In addition, optional subjects may be chosen from a list containing over 30. This permits the greatest flexibility in courses. In a survey of this size it is impossible to give sample time-tables to cover all the types of post-primary schools. In general, the common core accounts for one-half to two-thirds of the teaching periods in the third and fourth forms but occupies a much smaller fraction in the fifth form, where the emphasis is on School Certificate subjects.

An infinite variety of grouping of School Certificate subjects is possible, but in practice certain fairly well-defined courses emerge:

Academic: (a) English, mathematics, physics, chemistry, biology, or (b) English, French, history, geography, and Latin or biology.

General (a much wider variety here): (a) English, French or mathematics, general science, history, geography, or (b) no foreign language and a range of varied major optional subjects.

Commercial, with some or all of the following: book-keeping, shorthand and typing, commercial practice.

Home-life, with homecraft and clothing as two of the subjects.

Boys' technical, with woodwork, engineering workshop and technical drawing.

Rural, with selections from agriculture or horticulture, animal husbandry and dairying.

Pupils are grouped in courses such as these, and are frequently 'streamed' according to ability.

A sample academic course for better than average pupils is as follows (hours per week in parentheses): third and fourth forms—English (4.67), social studies (3.33), music (1.33), art (0.67), physical education (2.67), mathematics (4.67), general science (3.33), woodwork or homecraft (2), French (3.33), military drill (boys) or drama (girls) (0.67), total, 26.67 hours.

In the fifth form this group of pupils might coalesce with other groups to take a variety of options and the time-table might be: English (4.67), core mathematics (1.33), music (0.67), art (0.67), physical education (2.67), French or physics (4), history or mathematics (4), geography or chemistry (4), biology or general science (4), military drill or drama (0.67), total, 26.68 hours per week.

The popularity of the various optional subjects is indicated by the percentage of candidates taking them in the School Certificate examination, 1959: geography, 66 per cent; mathematics, 49 per cent; history, 43 per cent; general science, 37 per cent; French, 33 per cent; biology, 25 per cent, chemistry, 17 per cent; book-keeping, 15 per cent; commercial practice, 15 per cent. The remaining 21 optional subjects were all under 10 per cent. English is compulsory for all candidates.

In the sixth form the emphasis is largely on University Entrance subjects and the options are arranged so that a suitable course for university emerges, though provision is also made for students who do not intend to go to university. The following is a typical time-table for a co-educational multi-lateral type school of average size: English (4.67 hours), Latin or biology or additional mathematics (4.67), French or physics or book-keeping or art (4.67), history or chemistry or technical drawing (4.67), geography or mathematics (4.67), physical education and games (2), music (0.67), military drill (boys), elective (girls) (0.67), total, 26.69 hours per week.

Responsibility for the teaching of various individual subjects, or groups of allied subjects, throughout a school is given to 'heads of departments'. In a large multilateral co-educational school there would probably be departments of English, social studies, languages, science, mathematics, homecraft, commercial studies, engineering, and building. Each head of department is responsible to the principal for the general organization and practical working of his department. He prepares schemes of work and has the general direction and guidance of the teaching in his department.

In the larger schools ability grouping is possible in most courses and is commonly practised. The greatest problem here, implicit in universal compulsory post-primary education, is in connexion with the 'slow learners', where a radical adjustment of teaching methods is necessary. In the district high schools generally and in some courses of most secondary schools, because of their 'comprehensive' type, the wide range of ability within individual classes presents teaching problems. This is being met by the development of 'group teaching' within each class, calling for a greater flexibility of teaching techniques and making heavier demands on teachers.

Promotion of pupils up to the fifth form is automatic to the extent that all pupils at the end of the first year

proceed to the fourth form and the next year to the fifth form. Adjustments within a yearly group are, however, made on the basis of internal examinations held in the middle and at the end of the school year. Written reports on each pupil are forwarded to parents twice a year.

Most pupils in the fifth form sit for the School Certificate examination, which is accepted throughout the community as evidence of the completion of a satisfactory secondary education for those pupils not going to university. Except in rare cases pupils do not go into the lower sixth until they have passed the School Certificate examination. There, after a satisfactory year of study, they qualify for an Endorsed School Certificate, and are either accredited or sit for the University Entrance examination. Those who qualify for University Entrance and really intend to go to university usually take a year in the upper sixth, where they may qualify for the Higher School Certificate, which entitles them to remission from university fees, and in the case of full-time students, to an allowance of £40 a year plus a further £50 per annum if they are required to board away from home. Pupils in the upper sixth may also, if they wish, sit for the University Entrance Scholarship examination.

Teaching staff. The raising of the school age to 15 in 1944 and the introduction in 1945 of a compulsory core of studies with a wide range of options has resulted in a material alteration in the structure of teaching staffs, necessitating a much greater number of teachers and in a much wider range of subjects. The majority of post-primary teachers are still university graduates, but schools now require more qualified and trained teachers of homecraft, of physical education, of woodwork and metalwork and of commercial subjects as well as of the traditional academic subjects.

One of the most urgent problems in New Zealand education today is the shortage of post-primary teachers. An Advisory Committee on Teacher Supply and Training has been set up and a recruitment officer appointed. The major move for improvement has been the establishment of post-primary studentships providing liberal allowances for up to 4 or 5 years of full-time university study, followed by a year at training college on the teachers' salary scale. Liberal bursaries are available to students in physical education and in homecraft at the schools attached to the University of Otago. Special sections of the teachers' training colleges are also devoted to training homecraft teachers. Teachers of technical subjects are recruited from industry and most of them receive a year's training in a teachers' college. Special training schemes, with liberal allowances, have been introduced to recruit and train men and women drawn from commerce. A modified course in mathematics and science for women teachers has been established. Efforts to attract graduates of an older age group through a 3-month trial period of teaching in post-primary schools is meeting with some success.

Post-primary teachers are in five grades. Those in grades 1, 2 and 3 are on a basic salary scale reaching its maximum after 12 annual increments. On reaching grade 4 a teacher automatically enters a new salary scale. Further increase is dependent upon appointment to a 'post of responsibility', e.g., head of department; these posts are in three grades and are usually held only by grade 4 and grade 5 teachers. The highest positions are those of post-primary inspector or principal; in normal circumstances only grade 5 teachers are eligible for these positions. The best teachers can reach grade 4 in about 12 years and grade 5 in about 17 years. The salary structure permits what is in effect a qualification allowance to be paid throughout a teacher's service. Because of the rapid increase in recent years in the number of pupils entering the post-primary schools, the prospects of promotion have been and continue to be very good.

Vocational and technical schools

It has already been noted that in New Zealand most of the so-called technical schools are really general and pre-vocational in character. The orthodox secondary schools of 50 years ago were unwilling to develop practical courses to suit the non-academic child, and so day classes at the technical schools, now known as technical high schools, were developed to give a general secondary education with a practical bias; the latter made no attempt to provide direct trade training of the type given by technical schools in other countries. All the technical schools and some of the secondary schools conducted evening classes of a definitely vocational type for young workers, but these evening classes were usually regarded as subsidiary to the full-time day school. While secondary industries played a minor part in the country's economy this did not seriously matter and, indeed, the pre-vocational courses in the technical day schools turned out a type of boy well fitted to take his place anywhere in a wide range of small, scattered, and relatively simple industries. All he needed after that was a period of training on the job. With the rapid growth of concentrated and complex industries the whole situation has changed, and the very virtues that have won the New Zealand technical schools their place as equal partners in secondary education now make it harder for them to meet the demand for senior courses directly preparing for work in industry and commerce.

The technical schools in the principal cities have worked under considerable difficulties. They have, in fact, grown rapidly, and recently the heavy additional burden of day release training of apprentices has been thrown on them. At the same time, too, there has been in a limited number of schools a development of really advanced courses.

But a type of institution that caters for pupils ranging from 13-year-olds to adults, and teaches everything from spelling to professional engineering, can scarcely be expected to meet the more complex needs of the future, though it has hitherto served New Zealand well.

Technical education is perhaps best dealt with under the three levels of training needed—tradesmen, technicians and technologists.

The education of tradesmen. In New Zealand one-third of the boys leaving post-primary schools enter apprenticeship. The Apprentices Act 1948 provided for orders governing apprenticeship to be made by the Court of Arbitration on the recommendation of the New Zealand Apprenticeship Committees. In the major trades these orders make provision for the attendance of apprentices at technical classes during working hours or in the evening or both. Technical

classes are mandatory for all apprentices during the first three years of their apprenticeship period. The first 'day-release' classes began in 1949, since when there has been a steady growth in their number and in the trades they cover. Apprentices generally attend for 4 hours a week or 8 hours a fortnight, although some trades show a growing preference for 'block' courses, involving continuous attendance at a school for 40 hours a week during one or more weeks a year. The technical and secondary schools have undertaken this work and the Education Department's Technical Correspondence School has provided correspondence tuition for those in centres where there are no appropriate classes. Parallel with these developments in day-release training there have occurred, since 1949, far-reaching changes in the examinations open to apprentices. In conjunction with the Education Department, the New Zealand Trades Certification Board, set up in 1949, has devised a system of examinations covering 24 trades. Arrangements have been made with two statutory bodies, the Plumbers' Registration Board and the Electricians' Registration Board, to avoid as far as possible duplication of examinations or administrative machinery. The Motor Trade Certification Board also works in the closest relation with the Trades Certification Board.

It can fairly be claimed that trades examinations now exist in all the main trades and in many of the lesser ones, and that the schools are well on the way towards providing a training commensurate with the needs of apprentices. Although there are obvious deficiencies to be made good, the pattern of apprentice training for some time yet has been established.

The education of technicians. For various reasons New Zealand has been rather slow in providing for the training of technicians and, indeed, in the very recognition of this most important category, in which the education required is of truly secondary technical standard. In recent years, however, there has been considerable development. In 1954 the establishment of the New Zealand Certificate in Engineering marked a systematic effort to secure recognition for a major group of technicians. The Government set up a Controlling Authority which is placed under the chairmanship of the Assistant Director of Education, and includes representatives of engineering associations, the Technical Education Association, the Department of Education and the University. There are two grades of certificate, the lower with emphasis on practical subjects of direct use to an engineer of the middle group and the senior requiring more mathematics and science and having less immediately practical value.

In view of the growing interest displayed by industry as a whole in more advanced technical education the Minister of Education decided in 1957 to call together a study group. This group, representing industry, commerce and education, recommended the establishment of a Council for Technical Education to advise the Government on the needs of industry and commerce. In 1958 a much larger group, representing industry, endorsed this recommendation and further recommended a new system for training technicians in all fields where a demand existed. In 1959 the Council for Technical Education was established, with broad representation from industry, commerce, the University, the Department of Education and the technical colleges. In 1958 an Act of Parliament providing for a system of national examinations for technicians had been passed, and this came into force on 1 February 1960. The Act provides for the establishment of the Technicians Certification Authority, charged with the responsibility of establishing and conducting examinations for technicians. This body will absorb the Controlling Authority for the New Zealand Certificates in Engineering. Arrangements are in hand for the introduction of examinations for technicians in industrial chemistry and in building. Other industries are becoming interested in this field of technical education. Indicative of this new outlook has been the establishment of the Central Technical College at Petone by separating completely the Technical High School from the Evening School and day-release classes, and so allowing the development of a college for senior technical work. Among the courses taken here is the training of pharmacists in New Zealand for the first 2 years of their course. A similar split is taking place in the large city technical school in Auckland. The Technical Correspondence School, with its roll of over 4,000 students and a staff of approximately 80, is playing an active part. These moves, together with the appointment in the Education Department of a Superintendent of Technical Education, are a portent of considerable future development of true technical education in New Zealand.

The education of technologists. In engineering the larger technical colleges provide students who have been unable or unwilling to devote themselves to full-time university study with an alternative method of achieving professional status. However, in 1954, a committee sponsored by the Department of Education and representative of the New Zealand Institution of Engineers, the University, the Technical Schools, Government Departments employing engineers, and the Engineers' and Assistants' Association, decided that the aim should be for all candidates for professional engineering to take a university degree. The Committee further recommended that the main efforts of the technical college should be devoted to developing courses for technicians. The training of technologists is therefore largely within the province of higher education.

Out-of-class activities

Participation of pupils in school government in New Zealand is basically through the prefect system. The prefects, usually about 20 in number, are appointed or elected in various ways, but the school pupils themselves commonly have a considerable share in their appointment. Important disciplinary powers, varying from school to school, are entrusted to the prefects and they exercise a strong influence within the school. Many schools have adopted the 'house' system and the captains of the houses promote and organize to a considerable extent the extra-curricular sporting and social activities of the pupils in their respective houses.

Great emphasis is placed on sport as a means of developing character as well as physical fitness. A large proportion of post-primary teachers, particularly amongst the men, give up their Saturdays to organizing, coaching, and super-

vising secondary school sports; this work is done gratuitously by the teachers. For boys, winter games are chiefly Rugby football with an increasing amount of hockey and soccer, and for the girls, basketball and hockey. Summer games include cricket, tennis and softball. In addition, great attention is given to training in athletics and swimming, with competitive meetings for the combined post-primary schools in the various districts or provinces. There is intense interest and active participation in sport by the vast majority of pupils in the post-primary schools. Social life is full and satisfying, and social evenings with dancing are a regular feature of the winter months. The annual school concert, play or light opera is an event of some importance in the school year and high musical and dramatic standards are maintained. There is an abundance of hobbies and cultural clubs such as debating, public speaking, crafts, chess, stamp clubs, orchestra, drama clubs, choral societies etc.

The provision of and participation in extra-curricular sporting and cultural activities is traditional in New Zealand post-primary schools.

TRENDS AND PROBLEMS

This survey of secondary education will have shown that the more important changes in post-primary education in New Zealand in recent years can be related to three broad trends. These have been the efforts: (a) to provide equality of educational opportunity in the fullest sense, (b) to give pupils at all stages a richer and better-balanced education than they have had in the past, and (c) to meet the educational demands of our own changing society and the changing world.

Free education in post-primary schools for all up to the age of 19 at a time of vastly increased numbers in this age group has presented problems. Difficulties of accommodation for the augmented entry to the post-primary schools have been largely overcome by a vigorous expansion of the building programme in recent years. The dearth of post-primary teachers is, however, probably the most urgent problem in post-primary education today. Despite all the measures being taken to expand recruitment of post-primary teachers, there will probably be a shortage for some years, particularly in mathematics and science. Education being compulsory till the age of 15, we have the familiar problem of the reluctant learners—the small percentage of pupils, often poorly equipped mentally, who resent and resist efforts to teach them. In New Zealand, fortunately, their number is small, but the efforts wasted in teaching them can be ill afforded at a time of acute teaching shortage. The policy of giving equal educational opportunities to country and town pupils alike is firmly established, but it is a policy that is difficult to implement fully.

Inherent in the comprehensive character of New Zealand's post-primary schools is the problem of the wide range of ability in some classes. This is, however, preferred to the problems of selection.

The effort to meet the educational demands of our own changing society and the changing world is most apparent in technical education. Here the challenge of the recent striking advances throughout the world in science and technology, resulting in the growth of concentrated and complex industries, will have to be met by the provision of more specifically technical education in greater variety and at all three levels of tradesman, technician and technologist. It is in technical education that the greatest development is likely to take place in New Zealand post-primary education during the next few years.

STATISTICS

Population (mid-year 1958 estimate): 2,282,000.
Area: 103,473 square miles; 267,995 square kilometres.
Density: 22 per square mile; 9 per square kilometre.

Summary of school statistics, 1953–57. Total enrolment in all educational institutions in 1957 was almost 555,000, excluding some 30,000 persons attending adult education courses. In 1954 the school-going population represented over 21 per cent of the total population and in 1957 about 25 per cent; between these 2 years, total enrolment increased by 19 per cent. Enrolment in secondary education for this same period increased by 32 per cent.

The proportion of girls has remained fairly constant, i.e., around 48 per cent in primary education, 46 per cent in secondary education, 65 per cent in teacher training colleges, 24 per cent in institutions of higher education.

The proportion of women on the teaching staff has varied only slightly: in primary schools 53 per cent for 1957 as against 54 per cent for 1953; in secondary schools 37 per cent for 1957 as against 40 per cent for 1953; in teacher training colleges 35 per cent for 1957 as against 33 per cent for 1953. (See Table 4.)

Enrolment trends in secondary education, 1930–57. In 1957, enrolment in secondary schools was almost three times that of 1930. While the average total enrolment increased very substantially between 1930–34 and 1955–57, the ratio obtained by relating the average enrolment to the estimated population 15–19 years old shows a smaller rise, since the population also increased considerably over the same period. (See Table 2.)

Examination results in secondary education, 1953–57. Increases in the number of certificates awarded in 1957 over the number in 1953 were as follows: School Certificates, 59 per cent; technical examinations, 1.5 per cent; shorthand typists' examination (Public Service), 250 per cent; all certificates, 48 per cent. (See Table 3.)

Educational finance, 1957/58. In 1957/58 (fiscal year beginning April), total public expenditure on education amounted to 33 million New Zealand pounds, representing about £15 per inhabitant. Almost all money spent on public education came from central government revenues. Capital expenditure represented 26 per cent of the total.

NEW ZEALAND: ISLAND TERRITORIES

(Cook Islands, Niue Island, Tokelau Islands, Trust Territory of Western Samoa)

New Zealand is responsible for several territories in the South West Pacific; they are the Cook Islands, Niue Island and the Tokelau Islands, which are all under direct New Zealand administration and are, in fact, New Zealand territory, and the Trust Territory of Western Samoa. Politically, Western Samoa has reached a stage where, for all practical purposes, it is independent, only a few formalities being required to complete the change of status. However, New Zealand will continue to assist in the development of Western Samoa for some time to come and has committed herself to a plan, covering a period of at least five years, whereby appreciable financial help will be provided. Practically all of this money will be for education and in particular, for post-primary education.

All the island groups with the exception of the Tokelau Islands have their own post-primary schools. The Tokelaus consist of three atolls with about 2,000 inhabitants who live very simply, and at the moment primary education is being developed there from very humble beginnings. Western Samoa, however, has recently opened its second post-primary school, on Savai'i, and the Cook Islands have made provision for a second post-primary school, on Aitutaki.

In Western Samoa, Samoa College was established in 1953 at Apia, the capital. The buildings are of modern design. Most of the staff are New Zealanders, and the curriculum is planned to meet the requirements of the New Zealand School Certificate, providing in addition a certain amount of instruction adapted to local conditions. It is an academic school although some periods are set aside for instruction in domestic science and handicrafts.

In the Cook Islands, Tereora College, on Rarotonga, provides much the same type of education, but it was not until 1960 that the course included a satisfactory form 5, and that students were able to complete the preparation for the New Zealand School Certificate examination in full. Some candidates had previously presented themselves but most of these supplemented their work with correspondence lessons sent from the New Zealand Correspondence School which conducts secondary education in the more isolated parts of the Pacific.

In Niue, a post-primary school has been established

within the last three years. Although it has not yet been able to provide a full secondary course preparing candidates for the School Certificate examination, forms 3 and 4 are well established and it is only a matter of time before the School Certificate examination is introduced.

To supplement local schools, New Zealand provides a scholarship system, as a result of which a fairly constant stream of approximately 200 Island students attend New Zealand post-primary schools, universities or institutions providing professional training. The Government of New Zealand pays the whole cost of education, clothing and upkeep of these students. Already doctors, teachers and technicians trained under this scheme are returning to take up responsible positions in the Islands and the post-primary schools in these territories will soon be staffed largely by their own people.

This development has been very rapid. Even as late as 1948 the only post-primary institution in New Zealand's Pacific area was a small composite class in Western Samoa taught by one teacher at form 3 and 4 levels. In that year post-primary classes were started in the Cook Islands, but it was a considerable time before arrangements could be made for a sufficient number of permanent buildings. The pressing need for post-primary education will tend to speed up development, although New Zealand's own shortage of post-primary teachers is likely to hamper the staffing of post-primary schools in the Pacific for some time to come.

Since the people of each island group have their own distinct language and culture their problems are also quite different and each group must be provided for separately. An attempt is now being made, however, to adapt the examination for Public Service Entrance in Western Samoa to suit the Cook Islands and Niue, with a view to ensuring a uniform Pacific Islands examination and raising the standard. It may be some time before this can be achieved, as Western Samoa has so rapidly outstripped the other two territories.

In addition to the government post-primary schools the missions have set up small post-primary schools in most areas. Before the Government established schools, missions attempted to provide what was then regarded as post-primary education but what actually amounted to primary education for adolescent girls and boys. Usually, these schools grew food crops to assist their finances, but this had the disadvantage of slowing down academic progress. There are no government grants towards mission education in the Islands, and only in Western Samoa does the Board of Education include representatives from missions.

No trade schools have yet been established. In Western Samoa, students from Samoa College attend manual training classes and home science courses at a centre providing for the pupils from a number of schools. In the Cook Islands, Tereora College has a manual training block, but the instruction is supplementary to academic education. In Western Samoa there is a rudimentary trades school which provides instruction for people already in the trade, and an agricultural high school which gives basic practical training. This school is subsidized by the New Zealand Government since it is also open to students from the Cook Islands and Niue.

STATISTICS: COOK ISLANDS

Population (end March 1958): 17,000.
Area: 90 square miles; 234 square kilometres.
Population density: 189 per square mile; 73 per square kilometre.

Summary of school statistics, 1953–57. Enrolment in primary and secondary schools numbered 4,364 pupils in 1957 representing over a quarter of the total population. Nearly 94 per cent of enrolment was in primary schools, under 5 per cent in general secondary education and the remainder were students in the teacher training college. Half of the pupils in the public secondary school and at the teacher training college in 1957 were girls. The full-time teaching staff numbered 248 in 1957, of whom one-third were women. The pupil teacher ratio was 17 in primary schools in 1957, showing little change compared with 1953. After 1953 enrolment increased slightly at the primary level. but rapid progress was made in general secondary education. The number of students increased from 63 to 160 in the public secondary school over the 5-year period and in the teacher training college enrolment rose from 24 to 64. (See Table 2.)

Educational finance, 1957. Total expenditure on education in 1957/58 (fiscal year beginning April) was 130,650 New Zealand pounds, representing about £7.7 per inhabitant. About one-sixth of this amount was for capital expenditure. (See Table 1.)

STATISTICS: NIUE ISLAND

Total population (mid-year 1958 estimate): 5,000.
Area: 100 square miles; 259 square kilometres.
Population density: 50 per square mile; 19 per square kilometre.

Summary of school statistics, 1953–57. In 1957, a total of 1,100 pupils were enrolled in 8 primary schools and 59 in the post-primary school. Over half the pupils were girls. The number of teachers increased from 58 to 73 over the period under review and the average pupil-teacher ratio fell from 19 in 1953 to 16 in 1957. Post-primary enrolment rose from only 20 pupils in 1954 to 59 in 1957. (See Table 2.)

Educational finance, 1957. Expenditure by the New Zealand Government for education in Niue Island in 1957/58 (fiscal year beginning April) amounted to 45,053 New Zealand pounds, averaging about £9 per inhabitant. Twenty-nine per cent of this amount was for capital expenditure. (See Table 1.)

STATISTICS: TOKELAU ISLANDS

Population (mid-year 1958 estimate): 2,000.
Area: 4 square miles; 10 square kilometres.
Population density: 500 per square mile; 200 per square kilometre.

Summary of school statistics, 1953–57. Enrolment in three primary schools was 499 pupils in 1957 of whom 56 per cent were girls. The pupil-teacher ratio in public primary schools was 24. (See Table 2.)

Educational finance 1957. The sum of 6,380 New Zealand pounds was budgeted for education in 1957/58 (fiscal year beginning April), representing about £3 per inhabitant. Capital expenditure was a quarter of the total. (See Table 1.)

STATISTICS: WESTERN SAMOA

Population (mid-year 1958 estimate): 102,000
Area: 1,130 square miles; 2,927 square kilometres.
Population density: 90 per square mile; 35 per square kilometre.

Summary of school statistics, 1953–57. Total enrolment in educational institutions at all levels was 26,138 pupils in 1957, representing about 26 per cent of the population. There were in addition 170 persons, of whom a quarter were women, taking adult education courses. Over 96 per cent of the enrolment was in primary schools, 1.5 per cent in general secondary schools, 0.7 per cent in vocational institutions, 1 per cent in the teacher training college and the remainder were students in theological institutions. Girls made up half the enrolment in primary schools, 46 per cent in general secondary schools, and 57 per cent in the teacher training college. Only girls are enrolled in the vocational schools reported. The teaching staff numbered 824, of whom 54 per cent were women, and the pupil-teacher ratio was 33 in primary and 9 in general secondary schools. Compared with 1953, enrolment had increased by 22 per cent in primary schools and more than doubled in general secondary schools. However, enrolment in secondary schools declined somewhat from 1956 to 1957. The number of students training to be teachers increased by 22 per cent between 1953 and 1957. (See Table 3.)

Examination results in secondary education, 1953–57. There has been a striking increase in the number of students awarded the Samoan School Leaving Certificate after 2 years of post-primary study: 446 certificates were granted in 1957/58, of which over half to girls, compared with only 66 in 1953/54. Four students passed the New Zealand School Certificate examination in 1956/57 of whom 2 were girls. The number of teaching certificates awarded in 1957/58 doubled compared with 1953/54. (See Table 2.)

Educational finance, 1957. Expenditure on education in 1957 (fiscal year beginning January) was 251,110 New Zealand pounds, representing about £2.5 per inhabitant. Capital expenditure accounted for 10 per cent of the total spent. The New Zealand Government contributed some 8 per cent of educational receipts in 1957; the remainder was derived from territorial revenue. (See Table 1.)

THE EDUCATIONAL SYSTEM

The Nicaraguan Constitution enjoins upon the State 'to direct, regulate and inspect public education' (Article 195, paragraph 13). Article 99 declares that 'the system of primary, secondary (*enseñanza media*) and vocational education is under the technical supervision of the State'.

These state functions are performed by the Ministry of Education, whose Department of Secondary Education exercises direct supervision over all secondary schools, whether government or private.

While control of education is legally vested in the Ministry of Education other governmental agencies run certain special schools; for example, the Ministry of Health maintains a school for nursing, and the Ministry of War, Marine and Aviation, various military schools.

Although there exist in Nicaragua certain language problems, due to the predominance of English-speaking people in its Atlantic region (long under British rule) and to the existence of small indigenous groups (the Miskitos and Zumos), the country forms a fairly homogeneous cultural unit. The bulk of the population are of mixed racial origin, the descendants of Spanish settlers and Indians, and the dominant religion is the Catholicism introduced by the Spanish conquerors.

The Nicaraguan State is highly centralized and there are no public or private bodies initiating educational programmes independent of state control. The municipalities maintain a few primary schools, but their influence does not extend to secondary schools, which are established and maintained either by the State or by private agencies, most of the latter being religions organizations. The private bodies finance and determine the educational and religious policy of the schools they administer, but always under state supervision. They are able, nevertheless, to influence the country's educational policy through attendance at meetings and seminars convened by the technical departments of the Ministry of Education, through their representative on the Technical Council for Education, and through their legal right to nominate a representative to the committees responsible for examining matriculation (*bachillerato*) candidates.

THE DEVELOPMENT OF SECONDARY EDUCATION

The first schools of this type were founded in Granada and León in the latter part of the nineteenth century, and in general, secondary education still retains the characteristics handed down from this period.

However, the educational facilities for children and adolescents have gradually expanded and become more varied. The Teachers' School, the forerunner of the present teacher training schools, was founded at the beginning of the century. Next followed the commercial schools and, in the last five years, the Technical and Vocational Institute has come into being. The number of general secondary schools (*institutos*) has also grown, and these now number some 35 government and 35 private schools.

Legal basis. The rules and regulations governing all branches of secondary education are as follows: the regulation for general secondary schools, both state controlled and private (Executive Ordinance No. 918, 5 August 1948); the law on the technical and administrative organization of the Ministry of Education (Executive Decree No. 39, 8 April 1958); the general regulation for teacher training colleges (Decree of 1 July 1959).

The law regulating compulsory primary education has had little effect on the secondary school system. A very high proportion of children leave after primary grade 3 (there are 6 grades in all), so that the number of those who go on to secondary schools is small. However, in the last five years there has been a noticeable increase in the enrolments at both secondary and special schools. This is probably due to the rise in the standard of living and increasing mechanization of industry, where those who lack a minimum of general or vocational education find no openings.

Administration. The Department of Secondary Education is responsible for the structure, orientation and inspection of the education of those adolescents who, on completion of their primary schooling, wish to obtain a general education, or to enter a trade or the teaching profession.

The Department consists of separate sections for general secondary education, teacher training, and technical education. Attached to each section are inspectors who pay frequent visits to the schools in their district. In the course of these visits, they take note of the activities of the teaching staff, the progress made by pupils, the working of school services and of all the other aspects and needs of the school. After his visit, the inspector submits an immediate report to his chief in which he assesses the merits of the schools he has visited and suggests possible solutions for local problems.

In addition to these visits, the Department of Secondary Education holds meetings of principals to discuss all problems of secondary education, both general and specific.

Secondary education is neither compulsory nor free, but the Government is establishing in each of the 16 departmental capitals a secondary school, a commercial school, or a teacher training college, at which more than 1,000 pupils are being educated and housed through a system of fellowships, in addition to 2,130 day pupils.

That education is a constant concern of the Government is evidenced by the fact that the Education budget shows a yearly increase, amounting this year to 12.72 per cent of the national total. Of the moneys voted for education, 8.06 per cent is allocated to secondary education, the sum

available being used to pay for salaries, services, materials, for construction, maintenance of buildings and equipment, and scholarships.

The education budget is supplemented by allocations in the national budget derived from general revenue, special taxes and from public loans. Most of this (66.1 per cent) is used to pay the salaries of teachers and of technical and administrative staff. Many religious private schools receive an annual subsidy from the Government and almost all house hundreds of students holding government scholarships.

School buildings are planned and constructed by the Ministry of Development and Public Works, with the participation of the Ministry of Education. Some of the secondary schools own their premises and part of the education budget is set aside to pay the rent of those which do not.

The secondary schools have their own laboratories, stocked with a minimum of equipment, libraries, etc. This is paid for partly through government aid and partly out of the schools' own funds. The Ministry of Education supplies these schools with furniture of a kind and in a quantity to meet the needs of the locality. This problem has been solved through the recent establishment of a factory outside Managua, which is able to manufacture school furniture in sufficient quantities.

Teachers' salaries are not standardized and, in secondary and technical schools, teachers are paid according to the subject taught. In the teacher training schools, however, they receive fixed salaries as full-time or part-time teachers. Apart from the basic salary, teachers receive allowances for degrees and length of service.

State teachers enjoy freedom of association, receive welfare assistance and are guaranteed all the political rights of Nicaraguan citizens.

The Ministry of Education encourages teachers who wish to refresh their knowledge or pursue research by granting fellowships for study abroad. Fellowship-holders receive their salary for the entire period of such study.

Doctors and dentists, paid by the Ministry of Education, examine all pupils and complete the health card which all secondary school pupils are required to possess. Some schools have improved this service by opening their own medical and dental clinics with the co-operation of the Parents' Association (Asociación de Padres de Familia). These services are free to pupils.

TYPES OF SECONDARY EDUCATION

In Nicaragua, pupils leaving primary school may normally enrol at one of the following types of school: a general secondary school; a commercial or technical school; an agricultural school; another type, e.g., the school of fine arts.

There is no hard-and-fast system of guidance to parents and children in the choice of study courses. In co-operation with the Point 4 Programme of the United States Government, the Ministry of Education applies a system of industrial and vocational education for children who have completed the 5th and 6th years of primary school and the first year of secondary school; one of the aims of this system is to give the children vocational guidance. Plans have recently been made for a ministerial guidance office under the supervision of a psychologist. This office will, *inter alia*, give vocational guidance to those leaving secondary school.

Pupils who have their *bachillerato* may enrol at one of the following higher educational establishments: the National University (minimum course of study 4 years), the National Nursing School (3 years), the National Agricultural School (4½ years) or National Public Accountancy Schools (3 years).

The school year begins on 15 May and ends on 15 February and is divided into two terms by holidays in the last fortnight of September. Classes are held every day from Monday to Saturday and the school day is from 8 a.m. till noon and from 2 to 5 p.m. The total number of teaching hours per week is 30.

General secondary schools

The only schools of this type in the country are the *institutos*, which are the direct descendants of the Latin schools maintained by the Church in the Colonial period.

The aims of secondary education are to satisfy the educational needs of the adolescent and to take care of his training as a whole, and to prepare pupils for entrance to a university.

Enrolment is conditional on the successful conclusion of primary school. Pupils wishing to enrol at schools which grant scholarships with boarding facilities (the teacher training schools, the National Technical and Vocational School) and pupils wishing to obtain one of the scholarships granted by the Government for the public secondary schools and commercial schools, must sit for an entrance examination.

The principal and teaching staff in any school are free to group their pupils in accordance with age and capability. This practice is gradually spreading.

The matriculation syllabus is basically 'humanist' but there is a noticeable tendency towards increasing the number of hours devoted to scientific subjects. The following table shows the total number of hours per week assigned to the various subject groups for the whole 5-year course.

Subject groups	No. of hours	Percentage
Mother tongue	21	14
Foreign languages	21	14
Mathematics	21	14
Natural science	32	21.7
Philosophy and social sciences	36	24
Art	6	4
Home economics	3	2
Physical education and sport	10	6
Total	150	99.7

It will be noticed that the number of classes devoted to mathematics and natural sciences makes up more than a third (35.7 per cent) of the total for all subjects.

The usual methods of class teaching are those known as *recitación* (learning by heart) and *exposición* (explanation of texts). However, more positive and functional methods have been introduced in two groups of subjects: in Spanish,

the Ministry has obtained the services of an expert in this branch, whose collaboration has improved the methods used and brought textbooks up to date; in natural sciences, with the help of Unesco, a large number of teachers have been sent abroad for further study, with a consequent improvement in the teaching of this subject.

The regulations make provision for the following examinations. (a) Monthly: these are set by the teacher who must prepare a report showing the marks obtained by each pupil during this period. The teacher is also required to assess the pupil's progress at least three times a month. (b) End of term: these are usually held in the first fortnight of September and last 10 days of January. (c) Annual: held in the last fortnight of February. (d) *Bachillerato* examinations: these are taken by pupils who have completed the fifth year of secondary school. They can be held at any time of the year except during the holidays. Successful candidates obtain the diploma of *Bachiller en Ciencias y Letras*, which is necessary for enrolment in any of the university faculties.

At the annual examination, the pupils are given a report showing the average of their term marks. The mean between the term and examination marks is considered the final mark. The minimum pass mark is 7.51, the scale ranging from 5 to 10. Examinations are of the traditional type. Attempts to apply objective tests have not been successful.

Teaching staff. There are no teacher training schools for secondary education. Staff is recruited among professional men (doctors, pharmacists, lawyers, engineers), primary school teachers and matriculated persons who show the aptitude and vocation for teaching a particular subject. School principals are free to make their own nomination, which is then submitted for the Ministry's approval. The Ministry is making every effort to improve the training of teachers. Young men have been sent abroad to specialize and periodical refresher courses are held for in-service staff. The possibility of establishing a higher educational college for the training of secondary school teachers is now under consideration.

Vocational and technical schools

Agriculture. There are two agricultural schools, one of them, the National Agricultural School of Managua, at university level. The other, at secondary level, is the International Agricultural School at Rivas run by Dominican monks. Candidates for enrolment must have completed the second year of the secondary school at least. The course lasts 3 years and ends with the award of the diploma of agricultural expert (*perito agrónomo*).

Domestic science and careers for women. There are half a dozen private schools which teach dressmaking, cooking and other domestic skills. Some of them follow a syllabus approved by the Ministry of Education and are supervised by the Ministry.

Vocational and technical schools. In co-operation with the United States Government, through the medium of the Inter-American Co-operative Education Service, the Instituto Nacional Técnico Vocacional came into operation in May 1953. Courses are given in motor engineering, cabinet-making, electricity, sheet metalwork, refrigeration, welding, plumbing, diesel engineering, air-conditioning. The courses vary between 1 and 4 years and all include both theory and practice, with a minimum of 20 hours weekly in the workshop, 20 hours of technical theoretical and general subjects and 3 hours of physical education.

Applicants for enrolment must: (a) be not under 15 or over 25; (b) have completed primary school; (c) possess the necessary manual skill and vocation; (d) have passed the special entry examination; (e) have passed medical and laboratory tests of their mental and physical health; (f) submit a certificate of good character and conduct issued by the competent authority of the district. All the pupils receive bursaries and are issued free of charge the material and tools required for their instruction. Successful pupils obtain a technician's diploma in the branch they have studied. The teachers and experts work full-time and are paid on a special salary scale.

Public commercial schools. There are four of these, namely, a day and a night school at Managua, and a day school at Granada and Bluefields. The following courses are given: (a) secretarial and stenography (3 years at the day school and 4 years at the evening school); (b) accountancy (4 years at day school and 5 years at evening school). Applicants for enrolment must have completed primary school, pass an entrance examination, and show proof of good health and conduct. Accountants obtain their diplomas after 6 months of practical work and a final examination. More than 100 bursaries are granted by the Government.

Private commercial schools. There are 23 recognized schools providing commercial training, the great majority in secretarial work and stenography. Some also train accountants. These schools teach the official syllabus and are under the supervision of the Ministry.

There are more than 40 commercial schools which do not follow the official curricula and syllabuses, and over which the Ministry of Education has no direct control. Attempts are now being made to subject them to general educational legislation.

Teacher training schools

There are now 5 teacher training schools in the country. The development of this type of education was given considerable impetus when the Jinotepo Teacher Training School for Men and the San Marcos School for Women were associated with the Unesco major project on the Extension of Primary Education in Latin America. In addition, the Inter-American Co-operative Education Service is giving technical assistance to the rural teacher training school at Estelí. Three of these schools are co-educational, namely, the Estelí rural school and the Managua day and night schools.

Teacher training courses are also given at certain private establishments, which conform to the official programmes and curricula of the Ministry.

The aims of Nicaragua's urban and rural teacher training

schools are: (a) to give students a theoretical and practical education, to make them familiar with the ideals, problems, resources and needs of the country, to train them to teach in the primary schools of the Republic and to consolidate thereby the principles and practice of democracy; (b) to organize and develop psycho-pedagogical research; (c) to introduce students to the problems and practices of community education; (d) to give further theoretical and practical training to the teaching staff of the training schools and primary schools attached to them or situated in their vicinity; (e) to organize and develop special courses for the training of school principals and inspectors; (f) to develop activities contributing to the professional skill and improvement of in-service teachers; (g) to promote public interest in teaching as a profession by demonstrating its importance and its contribution to the nation's future.

Enrolment is subject to the same conditions as enrolment in secondary schools, except at the evening teacher training school. In this case applicants must have completed primary school, and if they are unqualified teachers, have had at least 5 years of experience or, if not, have completed at least the third year of secondary school. Students are chosen after an entrance examination.

At teacher training schools, great importance is attached to teaching practice, which is so arranged that students devote at least 80 hours in their fourth and fifth years to practical teaching in primary schools.

There is a special co-ordinating organ responsible for fostering the efficiency and smooth functioning of all teacher training schools. It consists of: (a) the Director of Primary Education; (b) the Director of Secondary Education; (c) the chief of the department for teacher training; (d) the principals of teacher training schools; (e) Unesco Technical Assistance experts; (f) a representative of the Inter-American Co-operative Education Service.

TIME-TABLE FOR URBAN TEACHER-TRAINING SCHOOLS

(in hours per week)

Note. The subjects of physical education and sport, art education, social education and home crafts are meant to be integrated with extra-curricular activities.

Other specialized schools

Admission to the following institutions is, unless otherwise stated, conditional on the satisfactory completion of primary school.

The School of Hygiene, administered by the Ministry of Health, trains health inspectors. There is no age-limit. The course lasts for six months, and students receive a monthly stipend of about U.S.$30. The school also trains health officers, but entrants for this course must have completed the second year of secondary school or the equivalent.

The National School of Music is under the Ministry of Education. The courses vary in length but, in general, last for at least 4 years.

The National School of Fine Arts, which is also administered by the Ministry of Education, gives courses in sculpture, painting, drama and ballet.

Military schools. These are administered by the Ministry of War, Marine and Aviation. The Military Academy requires that entrants shall have completed the second year of secondary school. The 3-year course includes general secondary education and those passing out are given the diploma of Bachelor of Science and Letters and the rank of second-lieutenant. Candidates for admission to the Radio School must have completed the first year of secondary school; the course lasts 3 years. The Aviation School has a 3-year course based on the second year of secondary school.

The National Seminary, which is administered by the Archbishopric of Managua, has a 12-year course for candidates for the priesthood.

TRENDS AND PROBLEMS

The government's main concern with regard to education is to achieve a more efficient organization of services, with greater emphasis on improved teaching quality on the technical side.

The trend in secondary education is away from the

inculcation of mere factual knowledge contained in syllabuses and towards the formation of the intellect, bearing in mind the characteristics and needs of our environment. The present organization of the secondary course as a single cycle will shortly be replaced by systems of two cycles, the first of which, lasting 3 years, will give a general education and the second, of 2 years, more specialized courses. It is also intended that curricula shall become more flexible.

The trend in vocational education is to adapt courses and organization to the present and future needs of the nation, particularly in agriculture and industry. To achieve these ends, it has become necessary to found new schools that will offer fresh vocational possibilities to pupils leaving primary school. It is also planned to create an executive organ which will co-ordinate the structure and orientation of the training given to technical personnel by the National Technical and Vocational Institute, private enterprise and the Institute for National Development (INFONAC).

Similar trends can be observed in teacher training, e.g., an increase in the number of schools, and intensified effort to give intending teachers the best professional training. These tasks are extremely urgent, for a solution to the grave problem of primary education depends largely upon the existence of well-trained teachers.

STATISTICS

Population (mid-year 1958 estimate): 1,378,000.
Area: 57,143 square miles; 148,000 square kilometres.
Population density: 24 per square mile; 9 per square kilometre.

Summary of school statistics, 1953–58. Total enrolment in 1958/59 may be estimated at nearly 150,000 pupils, representing about 11 per cent of the population; there were, in addition, 11,900 persons attending adult education courses. In 1957/58, the number of university students was 916. No separate figures for enrolment in vocational education are available for recent years. Of school enrolment reported in 1958/59, 3 per cent were pupils in kindergartens, 92 per cent in primary schools, 4 per cent in general secondary schools and the remainder, less than 1 per cent, in secondary teacher training schools. Girls made up more than half the enrolment in kindergartens and primary schools, 28 per cent in general secondary schools and nearly three-quarters of the enrolment in teacher training schools. Data on the teaching staff are very incomplete. In 1958/59, there were 3,684 teachers in public primary schools, of whom 89 per cent were women, and the average pupil-teacher ratio was 31. Compared with 1953/54, enrolment in primary and secondary education appeared to have increased by about 20 per cent by 1957/58. (See table.)

Examination results in secondary education, 1953–57. The only information available on examination results refers to teacher training certificates. In 1957/58, 81 certificates were awarded, against 34 in 1953/54. In 1955/56, the latest year for which figures are available, nearly two-thirds of the successful candidates were women.

Educational finance, 1959. According to data published by the Unesco Regional Office for the Western Hemisphere in the *Boletín Trimestral de Proyecto Principal de Educación Unesco-América Latina*, Vol. 2, No. 5 (January–March 1960), the 1959 budget estimate of the Ministry of Education amounted to 34,911,000 cordobas of which 20,249,000 cordobas were allotted to primary education. [Official exchange rate: 1 cordoba = 0.14 U.S. dollar (approx.).]

1. Included in primary schools.
2. Including kindergartens.
3. Public schools only, including kindergartens.
4. All public and private schools.
5. Public and private, including secondary education.
6. Public and private commercial schools only.
7. Including 66 (F. 63) students in one 'Normal' night school.

NORWAY

THE EDUCATIONAL SYSTEM

The Norwegian Constitution of 17 May 1814 makes no particular reference to education. The educational system of the country is regulated by special laws, the most important of which are: 1935, Act on Secondary Schools; 1938, Act on Teacher Training Colleges; 1940, Act on Vocational Schools; 1946, Act on Continuation Schools; 1949, Act on Folk High Schools; 1950, Act on Apprenticeship Schools; 1951, Act on Special Schools (for Handicapped and Mentally Deficient Children); 1954, Act on Experiments in Schools; 1957, Act on Secondary Commercial Schools and Vocational Schools for Commerce and Clerical Work; 1959, Act on Primary Schools.

Since 1814, when the union with Denmark was dissolved, Norway has been an independent, constitutional monarchy. The Evangelic-Lutheran religion is the public religion of the nation and is taught as a compulsory subject in primary schools and general secondary schools. Pupils who do not belong to the State Church are exempted from this instruction on application from their parents.

During the union with Denmark the Danish language gained ground in Norway, especially from about 1600, when it had become the only written language used in the administration. By 1814, when Norway gained her independence, the written language in use could scarcely be distinguished from Danish, but there were many Norwegians who, for nationalistic or democratic reasons, wanted to bring the written language more into conformity with the spoken language of the nation. The written language was gradually Norwegianized and had developed a marked difference from Danish by the beginning of the twentieth century. This form of the Norwegian language is known as *bokmål*. About 1850 the linguist Ivar Aasen created *nynorsk*, a language based on Norwegian dialects. This language was adopted by several writers and soon developed a literature of its own. *Nynorsk* was recognized as another official language in 1885, and since then *nynorsk* and *bokmål* have had equal rights. Subsequent spelling reforms have brought these two forms of Norwegian closer to each other. The local school board decides which of the two languages should be used in the primary schools within a school district. In 1955/56 *bokmål* was used in 2,681 school districts with 314,404 pupils, and *nynorsk* in 2,542 school districts with 106,374 pupils. In general secondary schools both languages are compulsory but the pupils choose one of them as their main language.

Apart from these two forms of Norwegian there are small linguistic minorities in the north, where Lappish is spoken by about 15,000 and Finnish by a few thousand Norwegians. A number of primary schools in this area give instruction in both Lappish and Norwegian, and Lappish textbooks are in use. There exist a few vocational schools intended for Lapps, but no general secondary school gives instruction in Lappish.

Education in Norway, both primary and secondary, is considered as the responsibility of the State. Except for elementary commercial schools, private schools are few. The Norwegian Representative Assembly (*Storting*) is elected directly by the people for four years. The final decision in educational matters lies with this body, which makes the laws and votes the money to be spent on educational purposes each year.

The Schools Department in the Ministry of Church and Education controls all primary and general secondary education and most of the vocational education. The Department has seven divisions—roughly one for each type of school. Matters of a purely administrative character, such as appointments, state grants, etc., are dealt with by the Ministry direct, while matters of a more pedagogical nature are generally submitted to one of a number of advisory councils, each dealing with a particular type of school.

For the purposes of civil administration Norway is divided into 20 counties. The county school board is composed of at least five members, of whom one is an expert on primary education, one on general secondary education and one on vocational education. The board promotes the school system of the county, and is in particular charged with long-range planning and co-ordination of the schools of the different communities within the county.

At regional (county) level the executive powers of the central education authority are vested in the school directors, of whom there are 11 in all, each responsible for a particular area. These school directors are state representatives, in both administrative and supervisory matters in the areas to which they have been appointed. Up to the present they have been mainly concerned with primary education.

The school system of each municipality is governed by a local school board whose members are elected by the municipal council, which is responsible for seeing that the municipality offers the best possible opportunities for both practical and theoretical education. All primary schools and the secondary schools run by the municipality are governed by the local school board. In all municipalities there is a school inspector. He acts as the executive secretary of the local school board and is in charge of the daily management of the school system. He is automatically a member of the advisory council for primary schools mentioned above.

Most types of secondary school have a board of management which supervises the activities of the school and attends to its requirements. The composition of the board of management is fixed in the laws governing the various types of school and differs according to which authority is responsible for the running of the school—the State, the county or the municipality.

The structure of the Norwegian school system is shown in the diagram on page 903.

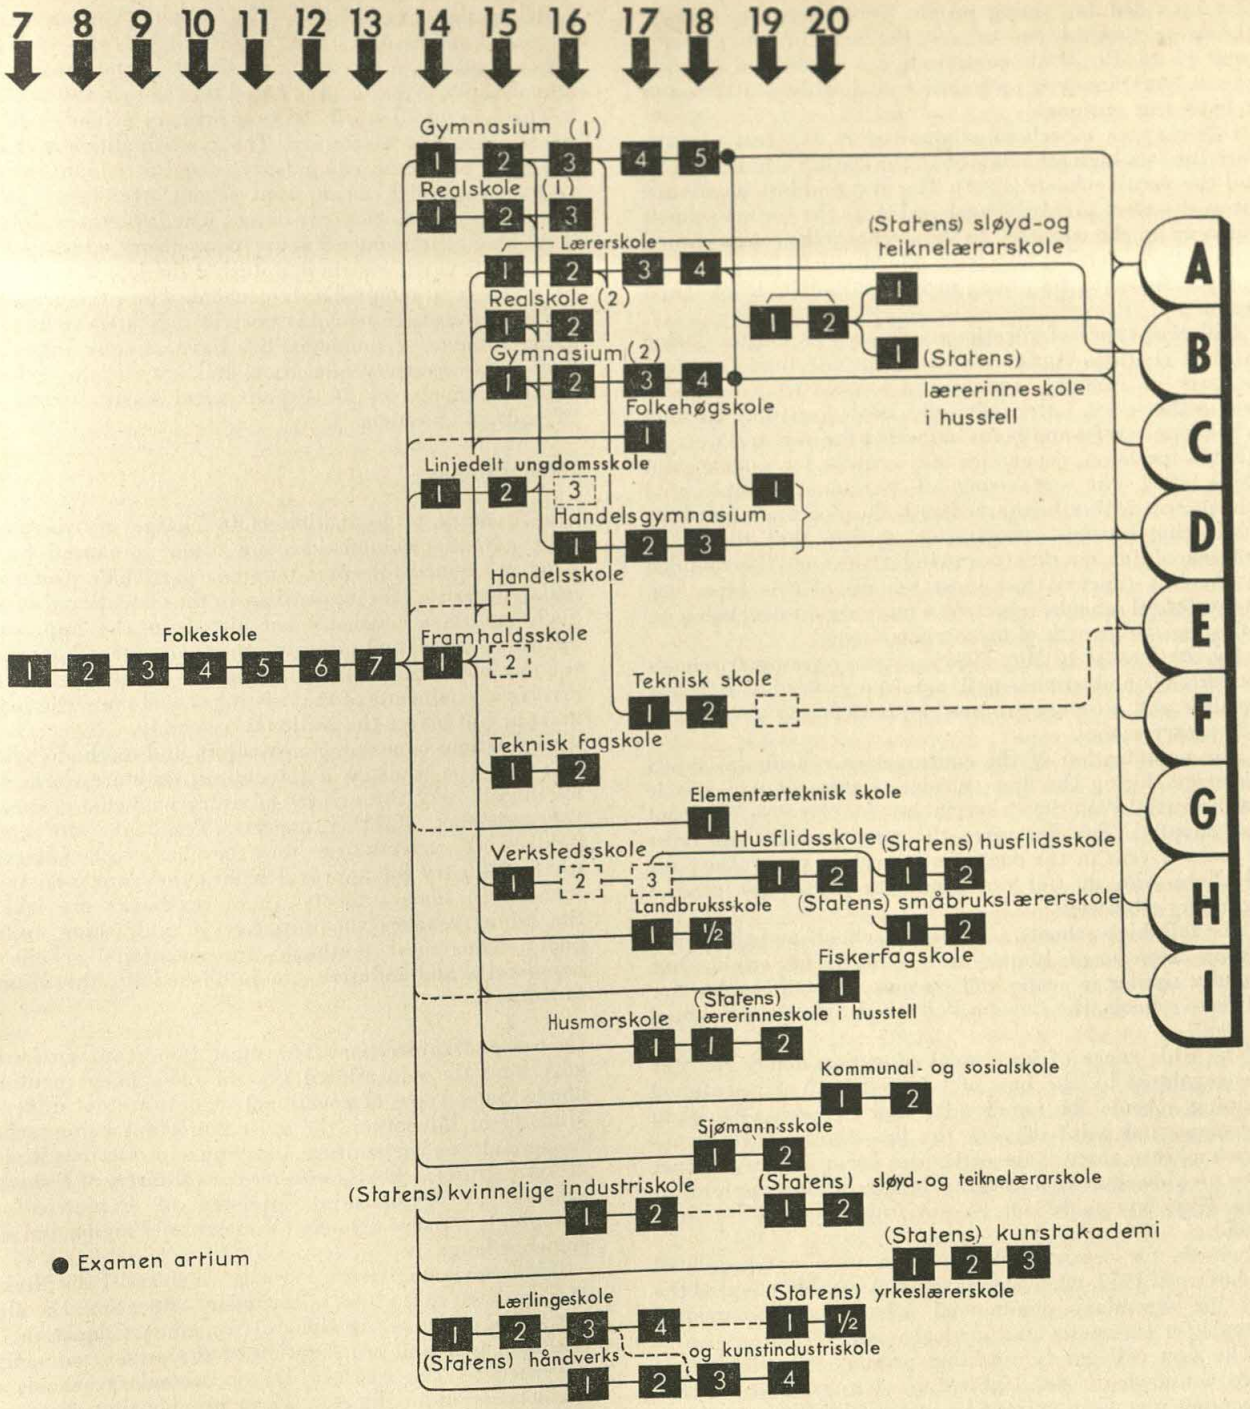
THE DEVELOPMENT OF SECONDARY EDUCATION

At the beginning of the last century, general secondary education was given in a few 'learned schools' or 'classical schools' (*latinskoler*) and in some cases in 'modern schools' (*borgerlige realskoler*). By an Act of 1869 general secondary education was reorganized. The two types of school, *middelskole* and *gymnasium*, then introduced, had a 6-year course for children from 6 to 15, and a 3-year course for young people from 15 to 18 respectively. The *middelskole*, as the name indicates, gave an intermediate education for children and young people who did not intend to go on to the university. But as admission to the *gymnasium* was based on the final examination at the *middelskole*, they had the opportunity to continue their education in the *gymnasium* and to matriculate at the university. By the Act of 1869 the *gymnasium* had two 'sides': a classical side with Latin and Greek as major subjects, and a science side with the main stress on mathematics, natural science and English.

Although the Act of 1869 aimed at articulating the primary schools and the general secondary schools (3+6+3), in many places primary education was given in preparatory classes attached to the *middelskole*. The link between the primary schools in towns and the secondary schools was immensely improved by a new Act (1896) on secondary education, which required that pupils admitted to secondary schools (*middelskoler*) should have had five years of primary schooling. The matriculation examination was reached through a 4-year course in the *middelskole* and a 3-year course in the *gymnasium* (5+4+3). In the gymnasium the two sides were reorganized as a Latin side and a science side, and a third, the English side, was added.

By the Act of 1896 the management of the secondary school system was vested in the Ministry of Education. To assist the Ministry in supervising the teaching and in arranging the leaving examinations the Council for Secondary Education was established. Regulations were also adopted for a local board of management for each state secondary school.

In 1921 the *Storting* adopted regulations which provided that no state funds should be allotted to a *middelskole* which was not based upon a 7-year course at the elementary schools. Following this first step towards a unified school system, a parliamentary commission was appointed to report on the further development of general education. The recommendations of this commission together with the views of outstanding educationalists became the basis of the Act passed by the *Storting* in 1935. By this Act the unified school system was adopted.



Besides the *middleskole* and the *gymnasium* two other types of school for general education originated in the middle of the last century. The establishment of the continuation school arose out of the need for further education of young people who did not intend to go to the general secondary schools. Originally the development of this type of school was confined to rural areas, but in 1908 the continuation school was also adopted by the towns. The length of the courses in the continuation schools first varied from 1 to 6 months, but later on the courses were extended. Apart from the continuation schools, which

GLOSSARY

elementærteknisk skole: vocational secondary school for industrial employees who have completed apprenticeship.
fiskerfagskole: vocational training school for fishermen.
folkehøgskole: folk high school (6-month courses in general education).
folkeskole: primary school covering the period of compulsory education.
framhaldsskole: continuation school.
gymnasium: general secondary school leading to higher education; (1) ordinary type, (2) rural.
handelsgymnasium: upper vocational secondary school of commerce.
handelsskole: vocational training school of commerce.
husflidsskole: vocational training school of home art and handicraft.
husmorskole: vocational training school of home economics.
kommunal- og sosialskole: school for social service and local administration.
lærerskole: teacher training college with courses at two levels.
lærlingeskole: part-time vocational training school for apprentices.
landbruksskole: vocational training school of agriculture.
linjedelt ungdomsskole: comprehensive school.
realskole: lower general secondary school; (1) ordinary type, (2) rural.
sjømansskole: vocational training school of seamanship.
(*Statens*) *håndverks- og kunstindustriskole:* state vocational training school of arts and crafts.
(*Statens*) *husflidsskole:* training college for teachers of home art and handicraft.
(*Statens*) *kunstakademi:* academy of fine arts.
(*Statens*) *kvinnelige industriskole:* state vocational training school of arts and crafts for women.
(*Statens*) *lærerinneskole i husstell:* teacher training college of home economics.
(*Statens*) *sløyd- og teiknelærarskole:* specialized teacher training school for teachers in school of arts and crafts for women.
(*Statens*) *småbrukslærerskole:* training college for teachers in agricultural schools.
(*Statens*) *yrkeslærerskole:* specialized teacher training school for teachers of vocational subjects.
teknisk fagskole: vocational training school for technical subjects.
teknisk skole: vocational training school at upper secondary level.
verkstedskole: vocational training school for pre-apprenticeship training.

were intended for young people from 14 to 16, evening schools were established to meet the needs of young people from 17 to 19. Both continuation schools and evening schools were financed by public contributions; attendance at both was optional.

Other types of school originating in the last century were the folk high schools (1864), the county schools (1875), and the youth schools (1893). The first and last mentioned categories were private schools, whereas the county schools were run by the counties. In these schools the courses lasted from 3 to 7 months, and were aimed mostly at providing general education for young people and adults in the rural areas.

Different types of vocational schools were begun during the last century. Agriculture being at the time the main industry of Norway, agricultural schools were naturally first in the series. Later followed schools providing training in the home crafts and home industries for men and women, schools for home economics and schools for seamanship. Until 1907 the organizing of permanent commercial schools was rather haphazard as no licence was needed for conducting business transactions before that time. The first schools for handicrafts and industries were also founded in the last century, but most schools of this type, e.g. the technical schools, represent a more recent development, following the growth of industrialization.

By the Law of 10 May 1935 secondary grammar schools (*middelskole* and *gymnasium*) were reorganized as a 3-year *realskole* and a 5-year *gymnasium*, both based on a 7-year elementary school.

The organization of the continuation school was much discussed during the first decades of this century, but it was not until 1946 that a special law for this type of school was adopted. The law gives the municipalities the right to make 1 year in the continuation school compulsory for all those who do not enter another school for general secondary education.

The folk high schools, the county schools and the youth schools mentioned above are of different origin, but broadly similar in scope and purpose. A common law for all these schools, the Law on Folk High Schools, was voted in 1949.

The wide range of vocational education before the war was regulated by the Law of 1 March 1940 on vocational training schools for handicrafts and industry. From an organizational point of view the law divides these types of school into three main categories according to whether they provide education prior to, during, or after apprenticeship. This law could not be put into force until 1 July 1945.

Schools for commercial education were not regulated by law until 1957, when the National Assembly adopted the law on secondary commercial schools and vocational schools for commerce and clerical work.

The first colleges for training primary school teachers were founded in the eighteenth century, but teacher education was not regulated by law until 1890. Instruction was to be given in a 2-year course, subsequently expanded to 3 years (Law of 1902) and 4 years (1930). Up to that time the teacher training colleges were based on the completion of the primary school, but the Law of 1930 also introduced a course for students who had passed the matriculation examination. The present law on teacher training colleges dates from 1938 and provides two main types of course, a 4-year course based on the continuation school and a 2-year course based on the *gymnasium*.

The Law of 10 April 1959 on primary schools will also affect secondary education. The municipalities will have the right to extend compulsory school attendance from 7 to 9 years, which means that school attendance will be compulsory up to 16 years of age. The law states that if it is decided to introduce 9 years' compulsory education in a municipality, the instruction during the last 2 years must be given in a comprehensive school. The organization of the comprehensive school is not yet regulated by law, but a fair number of municipalities have already introduced 9 years' compulsory education and are running comprehensive schools on an experimental basis (see section 'Trends and problems').

Administration

The Ministry of Education is in charge of educational policy. Special commissions are often appointed by the King in Council to report on some particular problem or make suggestions for innovations in the educational system. Such reports are usually submitted to the appropriate advisory council and often to other competent bodies, e.g. the teachers' organizations. If changes are proposed which involve amendments of the existing school laws, the matter must be put before the National Assembly.

Regulations concerning curriculum and methodology are issued by the Ministry of Education; they are worked out by the Ministry through its advisory councils, often with the assistance of other experts. Textbooks are mostly published by private firms, but they have to be submitted to the Ministry for approval before they are used in the schools. In some subjects where textbooks are lacking, the Ministry takes the initiative in publishing suitable books. Thus most textbooks for vocational schools for handicrafts and industry are published by the Ministry of Education.

Control and supervision. The most important authorities governing the educational system have been mentioned above. Some types of vocational schools are not under the Ministry of Education, the most important being: schools for agriculture, horticulture, dairying and forestry (Ministry of Agriculture); schools for fishermen (Ministry of Fisheries); schools for seamanship (Ministry of Commerce and Shipping); nursery schools (Ministry of Family and Consumer Affairs).

Of the several advisory councils which assist the Ministry of Education in matters of secondary education, the oldest is the State Council for General Secondary Education. The establishment and organization of the present council are governed by the Act of 1935 on secondary schools and regulations under the Act. These provide that the council shall consist of a chairman, a vice-chairman and six other members, all of whom have had practical experience in the field of general secondary education. Each of the written subjects taken at the matriculation examination has at least one representative. All the members are appointed by the King for a period of 5 years. In dealing

with matters of hygiene the council has the assistance of an expert, also nominated by the King for a period of 5 years.

The council is authorized to supervise the teaching in the *realskole* and in the *gymnasium*. It organizes the leaving examinations, sets the tests, and conducts these examinations on a nation-wide basis. At the request of the Ministry it reports on teaching problems and otherwise participates in the administration of the general secondary school system. In addition, the council is concerned with the teaching programme, approval of textbooks, appointment of headmasters, conferment of examination rights on new schools, and a great number of other matters.

The chairmanship of this council is a full-time post. When the other members meet in council or travel to inspect schools they have to obtain leave of absence from their teaching or administrative positions in the school system. Recently a full-time supervisor of English was attached to the council; his responsibilities, however, also cover the teaching of this subject in primary and continuation schools.

The corresponding body for vocational education and training below university level is the State Council for Vocational and Technical Education, established according to the Law of 1940 on vocational training schools of handicraft and industry. The law provides that more than half of the members of this council shall be representatives of the practical trades. In accordance with regulations adopted in 1946 the council consists of 15 members, including representatives from each of the following groups: labour unions, employers in industry and handicrafts, foremen, inhabitants of rural areas and different kinds of schools (including at least one teacher). The director of the vocational school system is *ex officio* the chairman of the council. One representative from the Ministry of Education and another from the Ministry of Municipal Affairs and Labour may take part in the meeting of the council and usually do so, but without having the right to vote.

The duties of this council are much the same as those of the other advisory councils, but as the vocational school system is still being developed the Council for Vocational and Technical Education has been given more initiative. It has, for instance, the duty of ensuring co-operation between the schools and industry in establishing the major objectives of the whole teaching programme.

In 1950 the National Assembly enacted a law on apprentices in handicrafts, industry, commerce and office work, establishing the State Apprenticeship Council, and laying down that one half of the members of the council should represent the trades covered by the Act, with equal representation for employers and employees. This council has 10 members, 9 of whom are nominated by the King in Council, with the Director of the Vocational School System as permanent *ex officio* chairman. Consequently the Council for Vocational and Technical Education and the Apprenticeship Council work side by side under his direction. They are, however, organized as separate institutions, each with its own office manager and staff. The main functions of the Apprenticeship Council are: to administer and supervise the national apprenticeship system as regulated by the law, and to advise the Ministry on matters relating to the introduction of the Act into municipalities previously not under the law, on occupations to be covered by the law, on the duration of apprenticeships, curricula, etc.

For commercial education there are two advisory councils, the State Committee for Commercial Schools and the State Council for Secondary Commercial Schools. Other advisory councils under the Ministry of Education include the State Council on Experiments in Schools, the State Council on Home Arts and Crafts Education, the State Council for Correspondence Schools, and the State Scholarship Council.

Advisory services of another kind are provided by special inspectors or counsellors directly attached to the Ministry of Education, e.g. for physical education, manual training, domestic science, drawing and modelling, etc.

As mentioned in a previous section, the school administration on the regional level consists of a county school board. This board is in charge of educational matters common to the whole county. It has, for instance, to make proposals to the county council concerning the income and expenditure of the schools to which county funds are allotted.

The state representative at the regional level, the school director, has administrative, supervisory and advisory responsibilities. His administrative function is to carry out the laws and all decisions taken by the Ministry affecting the school system under his management. In his supervisory capacity he is authorized to visit schools, observe the teaching and report on the standing and the development of the school system in his district. As an adviser he assists the Ministry on all educational problems either at the Ministry's request or on his own initiative. It is also his duty to serve as adviser to the county school board and all the local school boards within his area. The new law on primary schools, which will come into force from 1 July 1959 will affect the duties of the county school board and the school director to some extent, but the details have not yet been worked out.

The local school board makes recommendations to the Ministry of Education on the appointment of headmasters and teachers in the municipal secondary schools. The local school board serves as board of management to all secondary schools run by the municipality, but may also appoint special boards of management for one or several of these schools. For state schools, county schools and intermunicipal schools regulations concerning the composition of the board of management are issued by the Ministry of Education. In state secondary grammar schools the board consists of the headmaster of the school and six members, of whom four are chosen by the Ministry, one by the municipal council in the municipality where the school is located, and one from among their own number by the teachers of the school in question. The board supervises the activities of the school.

All types of secondary schools are directed by a headmaster who is automatically a member of the board of management. The headmasters of municipal secondary schools are appointed by the Ministry of Education on the recommendation of the local school board and the advisory council in question. Thus the headmaster of a municipal school is responsible partly to the local school board and partly to the Ministry.

Finance. Generally speaking, Norwegian schools may, according to their financial basis, be classified as state

schools or municipal schools. The state schools proper are run entirely by state funds, the total expenditure and income being fixed by the *Storting* for each school year. These schools provide secondary educational facilities in regions where the responsibility of running schools cannot be undertaken by any single local authority. During recent years, however, there has been a trend towards establishing such regional schools on a county basis or even on an inter-municipal basis. In the latter case, two or more municipalities jointly establish schools for further education.

The municipal schools are established and run by the municipality. Roughly speaking, the municipality has to provide for the buildings, maintenance, equipment, etc., while the State contributes to certain of the running expenses. Regulations concerning state contributions to municipal schools are either laid down in the law regarding the type of the school in question, or are otherwise approved by the *Storting*. In either case the necessary funds have to be allotted by the *Storting* for every budgetary year. The municipal schools form by far the largest group. Most secondary grammar schools (*realskoler* and *gymnasier*) belong to this group, and the state money spent on this type of school considerably exceeds the expenditure on the state schools.

In addition to the state contribution, municipal schools of certain types in rural areas are subsidized by county funds. In such types of municipal schools the total expenses are divided between the local, provincial and central authorities. Thus the municipality is responsible for its own school system, but the State and the county contribute to certain expenses, which are not necessarily the same for both authorities.

County allotments cover a minimum proportion of the cost of new buildings and remodelling of continuation schools in rural areas. All county allotments are paid out of the general county tax levied on the municipalities. Thus there is no special county tax for this purpose. Schools run by the county also obtain state grants, which are generally the same as those allotted to the municipalities.

Tuition fees are paid only in some types of secondary schools. In state schools some fees are still payable, but steps have recently been taken to abolish them. In municipal secondary grammar schools (*realskoler* and *gymnasier*) fees are still usually paid by the pupils. According to the law on secondary schools of 1935, the maximum amount per pupil for a school year is fixed by the *Storting*. Thus it is left to the local authority to levy tuition fees up to the maximum permissible. Many municipal councils however make no charges for tuition in schools providing further education.

In 1957 the National Assembly passed an Act establishing the Student Loan Fund (*Statens lånekasse for studerende ungdom*). This fund gives loans to Norwegian pupils and students studying at institutions of further and higher education for their final degrees. No interest is charged on such loans during the period of study and for one half-year after its completion. Students are obliged to repay the loans, plus interest at a low rate, within a maximum of 15 years after the close of their studies. To obtain a loan no private guarantee as security is necessary, but the student has to prove his aptitude for the study in question. The fund does not cover pupils in secondary grammar schools and the more elementary schools for vocational training.

The new national scholarship scheme, adopted in 1956 by the National Assembly, established the following criteria for the award of scholarships: economic need, absence from home during school attendance or the period of study, aptitude for the training concerned. These scholarships are available to pupils in schools offering general education and pupils at technical schools.

The funds granted in the state budget for this purpose are distributed according to advice from the State Scholarship Council.

In the vocational training schools a special scheme is in operation. In each fiscal year a certain amount is set aside for scholarship purposes from money collected through the unemployment insurance fund; the idea being that the unemployment fund shall offer economic aid for education to young people who might otherwise be unemployed during a period of depression on account of lack of training. Such scholarships are granted to persons who have paid their contributions to the unemployment fund for at least 45 weeks. At training institutions approved by the Directorate of Labour, pupils who comply with the regulation mentioned automatically receive a fixed grant per day during the period of school attendance.

Grants towards travelling expenses for pupils in secondary schools are met in two ways: (a) the State may give a contribution corresponding to 30 per cent of the cost of a return ticket twice a year for journeys of more than 200 kilometres from home to the teaching institution concerned; (b) the State and the municipality may jointly cover the expenses to meet daily travel of more than 6 kilometres.

School buildings. It is the duty of the various school authorities, in co-operation with the health authorities, to control the standard of school buildings and see that they are in keeping with the requirements laid down in regulations. Before new school plants are built, the plans must be approved by the Ministry. The Ministry of Education has recently appointed a school building committee to report on the co-ordination of the building of new schools and to work out standard plans for secondary schools of various types and sizes.

TYPES OF SECONDARY EDUCATION

When a pupil has completed his compulsory schooling, he may choose from among a wide variety of institutions for further education. For the time being, however, some types of secondary school are too crowded to admit all those who apply for admission, e.g., the secondary grammar schools of some municipalities. In such cases the pupils are generally admitted on the basis of the marks obtained in the primary school.

Guidance services have developed rapidly in Norway since the war. Such services are provided by the Directorate of Labour which has district offices in each county. In places of some size the local labour exchanges have special offices which assist young people in choosing education or training for different professions or occupations. During the last year in primary schools the pupils are given infor-

mation about the prospects of employment and the types of training required for various occupations; this is done either by a teacher or by a guidance officer who visits the schools.

Normally the school year in secondary schools follows that of the last few years in the primary school: 38 weeks a year, 6 school days a week, and 6 instruction periods a day, the summer vacation usually lasting from the end of June to the end of August. There exist, however, many types of schools, especially vocational schools, to which these general rules do not apply.

General secondary schools

For the time being three main types of schools provide for general secondary education: the continuation school (*framhaldsskole*); the folk high school (*folkehøgskole*); and the *realskole* and the *gymnasium*, the two last-mentioned often termed *høgre almenskoler* in Norwegian.

Continuation schools. Most municipalities, both in urban and in rural areas, provide for an eighth year of school work, i.e., 1 year of additional general education beyond the completion of the primary school. On the initiative of the local school authorities, the continuation school course may be made compulsory by the municipal council for all children who leave the elementary school without going on to other advanced schools. This is at present (1959) the case with more than one quarter of all rural and urban municipalities, and there is a general trend towards changing the optional schools into compulsory ones.

The aims of a continuation school are to promote general education, further the growth of character in the pupils, and prepare them for life. As this is the fundamental basis of the programme, the curriculum in the continuation schools offers theoretical training beyond the elementary school level in the field of general education, together with some opportunities for instruction related to various practical trades. To a certain extent the continuation school also aids the pupil to make a wise decision with regard to the choice of his further education or trade.

Two types of continuation schools may be established, one chiefly theoretical, the other giving training mainly in practical subjects, for instance: woodwork, metalwork, needlework, domestic cookery, etc. Within certain limits fixed by the law, the local school authorities of each district are entitled to build up and run continuation schools along the lines best suited to the people living in their part of the country. A typical time-table for a compulsory 1-year course is given on this page.

TIME-TABLE FOR 1-YEAR CONTINUATION COURSE

(in periods per week)

Subject	Theoretical line		Practical line	
	M.	F.	M.	F.
Norwegian	6	6	4	4
Citizenship	2	2	2	2
Health education	2	2	2	2
Mathematics and book-keeping	5	5	3	3
Mathematics	4	4	2	2
Book-keeping				
Domestic subjects with theory	–	5	–	10
Domestic science	11	6	17	7
Other practical subjects and designing	3	3	3	3
Physical education				
Total	33	33	33	33

The courses in the continuation schools may vary in length from 3 months to 2 years, in some cases to 3 years (evening courses). If the course has been mainly theoretical there is usually a final written examination, the local school board deciding which subjects are to be tested. All pupils, whether in theoretical or practical courses, are entitled to receive a certificate upon completion of their course. Certificates issued by continuation schools, however, cannot easily be compared on account of the differing content and duration of the courses.

Folk high schools. The purpose of the folk high school is to give young people advanced general education. To be admitted the pupils must normally have reached the age of 17. It is characteristic of these schools that they are liberal in organization and that the teaching, based on democratic ideals, aims at preparing young people for living in a democracy. The subjects taught are mainly the same as in the continuation schools, but as the pupils are older and more mature, the teaching is on a somewhat higher level. In addition more emphasis is placed on the theoretical side in the main course.

The ordinary course at a folk high school lasts for about 6 months, from October to April. A more recent development is a second year course, also of 6 months' duration; to be admitted the pupils must either have gone through an ordinary 6 months' course or have some equivalent training. This second year course, therefore, is a continuation or extension of the ordinary course. At the end of each course held by a folk high school there is usually an examination, arranged by the school itself. The pupils are granted a certificate showing their performance in the subjects taken, which may be useful when applying for admission to other types of secondary schools.

The 'realskole'. A *realskole* is either a separate institution or is combined with a *gymnasium*. The separate type is mostly found in rural areas, while towns as a rule maintain combined schools. The general aims of both the *realskole* and the *gymnasium* are 'to contribute to the pupils' Christian and moral upbringing and seek to develop them both mentally and physically'.

Based on the completed elementary school course, the *realskole* gives a general education which may provide the basis for further specialized training and for employment in various public bodies and in private concerns. The law provides for courses of 2, 3, and 4 years' duration, but the 3-year course is by far the most common. The 2-year *realskole* is popular in rural areas. It is intended for gifted pupils who satisfy the requirements of an entrance examination. If a pupil who is admitted to the first class of a *realskole* cannot keep up with the others, or does not appear to be mature enough to profit sufficiently from the teaching, the school council decides, before Christmas and after the pupil's parents have received due notification,

whether he or she may remain in the class. A pupil who has spent 2 years in a class and who is still not mature enough to be promoted or to be admitted to the leaving examination may neither continue as a pupil of the school nor be admitted as such to the examination.

The law on secondary grammar schools (*høgre almenskoler*) names the subjects to be taught in the *realskole* but the only reference to subject content concerns the teaching of Norwegian and is to the effect that *realskole* pupils are to be given written instruction in *bokmål* and *nynorsk*. However, the law provides that the scope and aim of teaching in the individual subjects shall be laid down in regulations. Thus detailed provisions concerning instruction in the different types of schools are issued by the Ministry in teaching plans (*Undervisningsplaner for den høgre almenskolen*) drawn up on the basis of recommendations made by the State Council for Secondary Education. These describe in detail the aims and the methods of teaching each subject and fix the number of weekly periods assigned to each subject.

TIME-TABLE FOR *REALSKOLER*
(in periods per week)

Subjects	3-year *realskole*			2-year *realskole*	
	1	2	3	1	2

Accounting	–	–	2	2	–
Drawing	2	2	–	–	2
Manual training	2	2	2	2	–
Physical training	3	3	3	2	2
Singing	1	1	1	1	1
Total	36	36	36	37	37

The *realskole* course concludes with a public leaving examination. All the subjects listed are required of pupils who wish to sit the complete leaving examination (*realskoleeksamen med full fagkrets*). The law provides, however, that the headmaster may exempt a pupil in the *realskole* from instruction in either German or English; for such pupils there is the 'single language *realskole* examination' (*ett-språklig realskoleeksamen*).

State schools and municipal schools with ordinary state support are entitled to hold the leaving examination at the schools. There are written and oral subjects, the latter comprising all the subjects offered except physical training. Pupils who have gone to a school with examination rights have to take tests in all written but in only one oral subject; other candidates take tests in all subjects, written and oral (such students are called *privatister*). For the written subjects, there is a countrywide examination in the latter half of May; this examination, held under the supervision of the State Council for Secondary Education, is the same for all schools, and the papers are marked by committees of teachers. For oral subjects, in the case of pupils from schools with examination rights, marks are awarded by the respective teachers in these subjects.

Gymnasier. The *gymnasium* provides a longer course than the *realskole* and at the same time prepares the pupils for entrance to universities and other institutions of higher learning.

A *gymnasium* course may last for 4, 5 or 6 years. The 4-year *gymnasium* is a rural secondary school based on a primary school course, usually without instruction in a foreign language, but as a rule with the addition of at least a 6-month continuation school or similar course. The 5-year *gymnasium*, which is the normal type, is based on the primary school course, with instruction in a foreign language (English).

The 5-year *gymnasier* are, generally speaking, municipal schools with state grants. The 4-year schools, on the other hand, are state schools in rural districts. A few private schools of the 5-year and other types still exist but there has been a trend towards the transfer of such schools to municipal status. As mentioned previously, a 5-year *gymnasium* is usually combined with a 3-year *realskole*. While the first 2 years of a 5-year *gymnasium* and a 3-year *realskole* are similar, providing exactly the same instruction, this is not so with the 4-year *gymnasium* and the 2-year *realskole*, where only the first year may be said to be identical. Admission to the first class of the 5-year *gymnasium* normally takes place on the basis of the elementary school leaving certificate. What has been said above concerning the selection of pupils on the basis of the entrance tests and the transfer of pupils to higher classes in the *realskole*, also applies to the *gymnasium*.

The *gymnasium* proper, i.e. the three upper classes, are divided into five sides: science, modern languages, Latin (with or without Greek), natural science and Norse. Pupils in a 5-year *gymnasium*, therefore, have to make their choice at the end of the second year, in a 4-year *gymnasium* after the first year. In 1957 the modern languages side supplied 46 per cent of all pupils graduating from *gymnasier* and the science side 50 per cent.

The curriculum of the *gymnasium* is laid down in the teaching plan already referred to in describing the *realskole*.

Although the *gymnasium* curriculum contains largely the same subject matter as that for the *realskole*, the degree of concentration in all the subjects is much greater and the requirements are far higher. Some subjects common to more than one side are also differently stressed on the various sides.

The *gymnasium* course concludes with the matriculation examination (*examen artium*). All the state and municipal schools have examination rights, i.e., they are empowered to hold the matriculation examination under the supervision of the State Council for Secondary Education. Like the *realskole* examination, the matriculation examination consists of a written and an oral part. As a consequence of this division, references are often made to written and oral subjects. It is a rather peculiar feature, however, that *privatister* (see above) are given oral examinations in the written subjects too, while a student at a school with

1. All subjects listed are required for the matriculation examination (*examen artium*).

examination rights has to take only one oral examination, in one of the subjects, either written or oral. (At the 1957 matriculation examination, between 17 and 18 per cent of the students were *privatister*.) Naturally, both categories of students have to take tests in all written subjects.

The written part of the matriculation examination is held in May and the oral in June. The written examination takes place simultaneously all over the country; the papers are set by the State Council for Secondary Education, and each script is marked by two experienced teachers. In this capacity the teachers are called *censorer* in Norwegian, and are appointed for a certain period by the Council for Secondary Education. In the oral test a pupil is examined by his own teacher if he is at a school with examination rights, and by an appointed teacher if he is a *privatist*. The mark for the oral test is, however, determined by a visiting teacher, who is the *censor*. Pupils other than *privatister* have to take only one oral test, and get 48 hours' notification of the subject in which it is to be. The matriculation certificates do not indicate which oral subject was actually examined.

As stated previously, the matriculation examination forms the basis for entrance to specialized studies at universities and institutions of higher learning. It is normally taken at the end of 12 years' schooling, at about 18 or 19 years of age. For the greater part of the candidates it marks the end of their formal education, but for others it is so to speak the platform for specialized training in science, letters, medicine, law, theology, engineering, commerce, agriculture, dentistry, etc. This group looks forward to studies leading to more exacting examinations for higher degrees; they are regarded as mature enough to do without further courses in general education.

About one-third of the primary school population in Norway goes on to the *realskole* and the *gymnasium*. Pupils leaving the *gymnasium*, therefore, may be said to form a select group.

Teachers. To become a full-time teacher in the *realskole* and the *gymnasium* it is necessary to have a university degree from the Faculty of Liberal Arts or the Faculty of Science. In addition, a 6-months' course in pedagogy is required. Teachers in the continuation schools are as a rule trained at the teacher training colleges, but have often some kind of additional training.

Correspondence schools. These play quite an important role as a supplement to the educational system of Norway. The first of them was established in 1914 and since that time several schools have come into existence. So far, however, no state school has been established, nor have any of the schools obtained state grants.

Vocational and technical schools

In the vocational field there exist a wide range of educational facilities. The survey given below does not pretend to be an exhaustive description of all the courses offered by the various educational institutions.

Commercial schools. Vocational schools for commercial and clerical work (*handelsskoler*) may run day or evening courses. There are usually three main types of course: a 6-months' day course, a 1-year day course, and a 2-year evening course (in some places also a 1-year evening course), of which the first and last cover the minimum requirements for a business man's licence. These minimum courses usually offer strictly commercial subjects: book-keeping, commercial mathematics, commercial law, business correspondence and office procedure, all of them compulsory. The curriculum of the 1-year day course comprises the same compulsory subjects, and a wide variety of optional supplementary subjects such as foreign languages, geography, history of commerce, political economy, shorthand, typing, etc. The teaching is more advanced and the final examination is of a higher standard.

Secondary commercial schools are called *handelsgymnasier*. They usually offer three types of course, a 3-year 'economic *gymnasium*' course (*økonomiske gymnasium*), which these schools are required to include by law, a 1-year general commercial course, and a 1-year secretarial course. Entry to the economic *gymnasium* course is confined to those who have had 2 years of general education in the *realskole* or in the ordinary *gymnasium*, or have passed the *realskoleeksamen*. There is no continuous upward line between the vocational commercial schools described above and the secondary commercial schools. Admission to the 1-year courses in the latter is based on a completed matriculation examination from any side in the ordinary *gymnasium*.

The economic *gymnasium* course gives advanced training in commercial and economic subjects together with general education and an introduction to social affairs. The Ministry of Education lays down the teaching plan for the economic *gymnasium;* the one now in operation is reproduced in the table at the top of the next page.

The course concludes with a leaving examination conducted along the same lines as the leaving examination at the ordinary *gymnasium*, and admitting to studies at universities and colleges.

Total	36	36	36

Vocational schools for industry and handicraft. This group includes several types of school regulated by the Act of 1940 on vocational education. The instruction provides the pupils with the practical skill and the theoretical knowledge which are necessary for the vocations concerned and which they cannot expect to acquire through their work in a factory.

Workshop schools (*verkstedskoler*) provide instruction prior to the period of apprenticeship; they are called preliminary schools. Their aim is to furnish young people with knowledge of machines, tools, materials and methods of work, and practical skill in their trades which will be of advantage to them in beginning their apprenticeship. To be admitted, the pupils must have reached the age of 14 and completed the primary school course. Generally, however, the schools prefer to take them at 15 years of age or more.

The ordinary preliminary school lasts for 1 school year. But other and longer courses are also authorized; for instance, advanced courses of an additional 6-months' to 1 year's duration (extended preliminary school). There are also a few 6-month preliminary courses in some trades. If the conditions within a certain trade make training through apprenticeship difficult or impossible, a full-time school in such trades with daily instruction for 3 years may also be established. A few such complete workshop schools are in operation in various trades, e.g. radio mechanics, agricultural mechanics, motor-car repair mechanics, shoemaking, bricklaying and tailoring. These schools prepare the pupils for the journeyman's test in the trade concerned.

TIME-TABLE FOR 1-YEAR PRELIMINARY SCHOOL (A-PLAN)

Total	42	84	42	1 260	42	336	1 680

The Ministry has drawn up standard teaching plans for the different types of workshop schools. One of these plans, the A-plan for 1-year preliminary schools, is given in the table at the bottom of the previous column. It constitutes a course including theoretical instruction corresponding to that given during the first 2 years of a normal 3-year apprentice school.

A pupil who has completed a preliminary school run according to the A-plan has to take the last year of the 3-year apprentice school course when he is indentured.

Apprentice schools (*lærlingskoler*) offer training during the period of apprenticeship. Their aim is to provide the theoretical knowledge which craftsmen should acquire during apprenticeship, but which is not obtainable in the factory or place of work (theoretical apprentice schools), or to provide, where necessary or desirable, in addition to the theoretical knowledge, supplementary practical training in the school workshop (practical apprentice schools). To be admitted to an apprentice school the pupils must have reached the age of 14 and have completed the 7-year primary school course. Normally the pupils entering an apprentice school are 15 or over, but as these schools are also open to youth who are not apprentices, the law offers the possibility of entering at the age of 14. All apprentices are obliged to attend an apprentice school if such a school is established within reach of their work-place.

The ordinary course at an apprentice school lasts for 3 school years, each of about 8-months' duration (30–31 weeks). A supplementary course of 1 year's duration is often offered for those who want to prepare for a craftsman's licence; it is not compulsory, as there are many other ways of preparing for this. Instruction at the apprentice school may be given in evening courses with 10 hours' instruction per week, 2 periods daily for 5 days a week. Where conditions make it desirable the instruction may be concentrated in fewer days per week, or all the instruction can be given on one whole day each week (in which case the total number of teaching periods per day shall not exceed 7 without the approval of the Ministry).

The teaching at the apprentice schools is based on a standard plan adopted by the Ministry of Education.

Schools offering post-apprenticeship courses. Full-time schools of this type have so far only been established in a few fields, although the further training of those who have finished their apprenticeship is regarded as a vital necessity. The schools and courses established are intended for skilled workers, journeymen, master craftsmen, foremen and supervisors.

Among the institutions offering courses after the period of apprenticeship, the State Technological Institute plays the most important role. Its aims are to give independent producers, together with workers and foremen, the op-

portunity of learning the proper use of technical aids in their occupations, and to increase their knowledge of modern production procedure. These objectives are accomplished by instruction and training given in short courses. Two schools, one a state school (Oslo) and the other a municipal one (Bergen), offer various courses for young people who have special artistic abilities in drawing and modelling.

Elementary technical schools (*elementærtekniske skoler*) have as their main objective the provision of general education and theoretical elementary technical training for workers and employees in industrial concerns and in construction undertakings. The schools run 1-year courses based on the completed primary school course. The minimum age of admittance is 17, but preference is given to applicants who have a certain amount of practical experience. These schools are very often attended by pupils who have 8 to 10 years' experience and want to acquire technical knowledge of a somewhat more comprehensive character than that offered by the apprentice schools.

Technical trade schools (*tekniske fagskoler*) are practical-theoretical schools providing the training required for a number of different posts in industrial concerns and construction work (foremen, works managers, designers and similarly qualified positions). The courses last 2 years with practical and theoretical instruction in approximately equal proportions.

Technical schools (*tekniske skoler*) set out to provide a technical and general education which will enable students to take over medium or higher technical positions in industry and in the state and municipal technical administration. The ordinary course lasts 2 years and is purely theoretical, with some laboratory work. However, a Bill has recently been submitted to the National Assembly seeking to extend the course for another year. Thus it is anticipated that 2-year and 3-year courses may in future exist side by side.

The minimum age for admittance to the technical schools is 17. The holder of a *realskole* certificate may be automatically admitted provided he has at least 2 years' practical experience of a kind recognized by the department to which he is applying for admission. Applicants who have not passed the *realskole* examination or who have passed it more than 4 years previously have to take an entrance test in Norwegian, one foreign language (English), mathematics, natural science, drawing and writing. The schools run special preparatory courses of 6 months' duration to prepare applicants for the entrance examination, while for applicants with *realskole* certificates older than 4 years preparatory refresher courses lasting 3 months are also in operation. It should be borne in mind, however, that there is keen competition for admission to the technical schools, and consequently there is a tendency to prefer those who have the most comprehensive practical training. This fact has contributed to the rise of the average age of admission to 19–20 during the post-war period.

The technical schools are divided into departments, of which the largest schools have nine. Each head of department is appointed by the Ministry from among the teachers in the main technical subjects and has the immediate supervision of the teaching in the department, the laboratories and the technical collections, and is responsible to the director of the school. The number and types of departments may vary from school to school, the most common being construction and building technique, house building, chemistry, electro-technics, and machine-engineering. With the approval of the National Assembly, schools may add new departments if there is a demand for the training concerned.

A sample teaching time-table for 2-year courses in the departments of building construction and electro-technics at technical schools is given below; the table shows the number of weekly periods in each of the four terms (two terms per year) and the total number of periods for each subject in the courses.

Subject	Building construction				Electro-technics					
					Basic stage[1]		High-tension current		Low-tension current	
	I	II	III	IV	I	II	III	IV	III	IV

Total	43	44	44	44	43	46	48	44	42	38

1. The first year in the electro-technics department forms a basic stage, leading to specialization (high-tension or low tension current) in the second.

Schools for home arts and crafts (*husflid-og heimeyrkeskoler*). These schools offer vocational training more or less similar to that provided in the preliminary schools. The courses for men are from 6 to 10 months' duration, and include theoretical instruction and practical training in such subjects as woodwork, painting, drawing, knowledge of materials, calculation, book-keeping, electro-technology, modelling, designing and a number of other subjects relating to home arts and industries. The corresponding schools for women offer courses in weaving and sewing, lasting for 3 months to 2 years.

Agricultural schools (*landbruksskoler*). As a rule, these are public institutions run by the counties. The ordinary courses last for 18 months, giving theoretical instruction during two winters and practical training in the intervening summer. To be admitted, students must be 18 and must have had at least 1 year of general experience in their field of study. Those matriculating from these schools are called agronomists. Students who have passed the leaving

examination from the *gymnasium* or taken a special preparatory course are admitted to the State College of Agriculture.

There are also schools of horticulture (*hagebruksskoler*), of dairying (*meieriskoler*) and of forestry (*skogskoler*).

The training of teachers for service in the different types of agricultural school is conducted by the State College of Agriculture and by the State Training College for Teachers in Smallholders' Schools.

Schools for housekeeping (*husmorskoler*). A student has to be aged 18 and to have had one year of housekeeping experience. The courses offered vary in length from 3 to 10 months. As the county schools usually have farms they may also offer courses in horticulture and animal husbandry. Other schools generally have courses in food preparation, care of kitchens and kitchen equipment, laundry-work, house cleaning, hygiene, child care and the care of the sick.

Schools of seamanship (*sjømannsskoler*). There are schools of navigation preparing sailors who possess a certain length of marine service for the mate's and master's certificate examinations. To be admitted to the department preparing for the mate's examination, the period of marine service needed is at least 42 months subsequent to the age of 15, at least 12 of which must have been served on ships in foreign trade. The duration of this course is 10 months, and the holder of a mate's certificate must be at least 21. Admittance to the department preparing for the master's examination is restricted to those who have passed the mate's examination and have served as mates on ships of 500 tons or above for 24 months in foreign trade. Half the time of service must be as first mate. A master's certificate is only granted to persons aged 24 or over.

Schools for marine engineers offer theoretical instruction for men aged 17 or over with 9 months' practical experience in mechanical engineering and 3 months' service at sea.

Attached to some of the schools of navigation is a department in which training is conducted for wireless operators at sea.

Fishing trade schools (*fiskerfagskoler*). These offer a 1-year course with the main stress on practical training and theoretical instruction in subjects relating to the fishing trade, and in addition some general subjects such as physics, chemistry, Norwegian, hygiene and book-keeping. The requirements for admission to the courses are a completed primary school education and 24 months' service at sea.

In addition to the schools mentioned above, there exist a number of schools for other occupations, e.g. training schools for nurses run in connexion with the hospitals, and for midwifery (under the administration of the Ministry of Social Affairs). Some of the major public services run schools for the training of their own employees (customs and excise, the postal service, the telegraph service, the railways and the police).

Teacher training schools

The training of teachers for primary schools, continuation schools and folk high schools is the responsibility of teacher training schools (*lærerskoler*). All these *lærerskoler* are entirely financed by the State. The teaching is completely free of charge.

The law provides for two main types of course, lasting 4 years and 2 years respectively. The 2-year course may have two lines of study: the normal line, which corresponds to the 4-year course, and an English line in which the teachers of English in primary schools are trained. In the 2-year course of study a student may have 1 year of practical teaching between two school years and afterwards come back to complete his training.

Admission to the 4-year course is based on an entrance test held under the supervision of the State Council for Teacher Training at a time set by the Ministry. For admission to the 2-year course, the applicant must have reached the age of 19 before 1 July in the year in which admission is sought. He or she must have the matriculation certificate either from an ordinary *gymnasium* or from the economic *gymnasium*.

TIME-TABLE FOR 4-YEAR TEACHER TRAINING COURSE
(in periods per week)

Subject	Year			
	1	2	3	4

Writing	1	–	–	–
Crafts	2	2	2	2
Physical training	4	3	3	4
Total	37	37	37	36

All the subjects in the table above are compulsory. Practical instruction in teaching takes place in the practice school, which may be an ordinary municipal elementary school, or an elementary school run by the State in connexion with the teacher training school. In the 4-year course, the practical training is taken during the last 2 years, and in the 2-year courses in both years. The courses end with a final examination, the teachers' examination, which is held under the direction and supervision of the State Council for Teacher Training. The Council for Teacher Training decides in which of these subjects the students shall be tested. In practical teaching there is no final examination.

To provide for specialized supplementary training, a few institutions have been established and are run by the State. Courses at these institutions may be taken immediately on the completion of the teacher's examination, but it is rather more common to supplement one's training after a

short period of teaching service. The following give additional training: the State School for Teachers of Arts and Crafts; the State School for Teachers of Home Economics, the State School for Teachers of Arts and Crafts (Women), the State School for Physical Education.

TRENDS AND PROBLEMS

Reference has previously been made to the Law of 1954 on experiments in schools. One of the most important experiments being carried out under this law concerns the comprehensive school (*linjedelt ungdomsskole*), which aims at an amalgamation of the continuation school and the *realskole*.

This experiment is based on the assumption that if the nation's young people are to benefit fully from higher specialized training in the vocational field, the period of compulsory school attendance will have to be extended from 7 to 9 years. The responsibility of devising a workable system of 9 or even 10 years of continuous compulsory education, beginning with a common curriculum and finishing with a comprehensive but pedagogically differentiated education, has been placed on the State Council for Experiments in Schools.

The first experimental schools are based on a completed primary school course and form a secondary stage of 2 years. This stage is differentiated into two main lines: the general and academic line which leads to the *gymnasium*, and the general and pre-vocational line, which leads to vocational training and work in various trades. The courses are united under one principal with one staff of teachers and form a single community with common activities. The subjects offered in these experimental schools are those usual in general education in Europe. Particular stress is also laid on aesthetic education and creative work. Psychological and vocational guidance plays an important part. The introduction of guidance and pre-vocational training in a course which is common to all will give the pupils an opportunity to pursue a suitable line of study better adapted to individual needs.

The general and vocational preparatory line has a slight differentiation in the ninth year which makes it possible for the pupils to choose subjects especially appealing to their interests and abilities. The choice might be commercial, home economic, agricultural subjects or activities relating to crafts.

At this moment it is hard to tell how the new type of school will be organized in the future, but there seems to be unanimous agreement that an extension of compulsory school attendance is urgently necessary if the nation's educational facilities are to cope with the development of the society it is intended to serve. The new Law on Primary Education (1958) gives the municipalities the right to introduce 9 years of compulsory schooling, and there is reason to believe that a large number of them will use this right as soon as they are able to meet the increased demand for school buildings. The law also states that in such cases the instruction during the last 2 (or 3) years should be given in a comprehensive school, run on an experimental basis and supervised by the State Council of Experiments in Schools. It is believed that in the first five years the council will be able to evaluate the findings of the experiments and submit a recommendation on the organization of the comprehensive school.

STATISTICS

Population (mid-year 1958 estimate): 3,526,000.
Area: 125,065 square miles; 323,917 square kilometres.
Population density: 28 per square mile; 11 per square kilometre.

Summary of school statistics, 1953–57. In the school year 1957/58, enrolment at all levels in public schools and in a few private secondary schools totalled some 595,000 pupils which represented about 17 per cent of the total

population. This did not include adults attending folk high schools. Enrolment in primary schools represented 79 per cent of the school-going population; another 19 per cent were in general and vocational secondary schools, 1 per cent in institutions of higher education and the remainder were in secondary and higher teacher training schools and in special schools for handicapped and maladjusted children. From 1953 to 1957 total enrolment increased by 18 per cent.

In 1957/58 the proportion of girls was 49 per cent in primary schools, 47 per cent in general secondary schools, 40 per cent in vocational secondary schools, 62 per cent in secondary and higher teacher training institutions and 19 per cent in general and technical institutions of higher education. As compared with 1953/54, these proportions had changed very little except in teacher training schools in which total enrolment was low. The position is similar as regards the proportion of women on the full-time teaching staffs: 46 per cent of women teachers in primary schools for 1957/58 and 45 per cent for 1953/54, 20 per cent in general secondary schools for 1957/58 and 18 per cent for 1953/54.

In primary schools there has been no significant change in the number of pupils per teacher—27 in 1957/58 and 28 in 1953/54. (See Table 1.)

Enrolment trends in secondary education, 1930–57. Average total enrolment in secondary education more than doubled between the periods 1930–34 and 1955–57. (See Table 3.)

Examination results in secondary education, 1953–57. Diplomas and certificates granted totalled 49,887 in 1957/58 and 42,540 in 1953/54. Final examinations at general secondary schools (*realskole* and *gymnasium*), trade and crafts schools apprentices' certificates and commercial school certificates represented between 75 and 80 per cent of the total. The proportion of girls among successful candidates for all examinations increased very slightly from 39 per cent in 1953/54 to 42 per cent in 1957/58. (See Table 2.)

Educational finance, 1957. Total expenditure on education in 1957 (fiscal year begins in January) amounted to 1,028 million kroner; this was 295 kroner per inhabitant. About 76 per cent came from local authorities, 21 per cent from the Central Government and the remainder from tuition fees. Capital expenditure represented about 23 per cent of the total. Percentage distribution of recurring expenditure is given in Table 4C.

PAKISTAN

THE EDUCATIONAL SYSTEM

With the emergence of Pakistan as a sovereign independent State, education received a great impetus. The country had inherited an educational system installed a century ago and founded upon socio-economic and politico-cultural bases entirely different from those of an independent country, especially a country where the social structure in most parts is based upon Islamic ideology. To make schools capable of meeting the new calls made upon them, Pakistan has had to face many arduous problems, including the provision of an adequate national system of education, a supply of well trained teachers, curriculum re-organization, re-orientation of teaching methods, the provision of adequate facilities for technical and vocational education, the organization of adult education schemes with a view to liquidating mass illiteracy, etc. Ever since independence, there have been dynamic changes and a new orientation in all phases of the educational system, in keeping with the traditions and long cherished aspirations of the people.

In the national system of education there are three general stages—primary, secondary, and higher. Besides this broad classification, provisions exist for pre-primary (though not everywhere), technical, vocational, commercial and professional education in the various parts of the country. The structure of the system may be seen in the diagram on page 919.

Pre-primary education. In the urban areas there are a few kindergarten and infant schools, mainly run and managed by the private agencies. A number of infant schools have been opened in the rural areas also; these schools are financed by the local and central governments 'to act as a fillip' to private enterprise in this direction. There are no prescribed syllabuses for these schools, which follow their own methods. At this stage co-education is the rule.

Primary education. The duration of primary education (after the introduction of compulsory education in some parts of the country, and after an overall reorganization of the educational system) is now 5 years in all parts of Pakistan. The average age of primary school pupils is 6 to 11 years. The medium of instruction is the mother tongue or the regional language. In the rural areas, and even in urban schools, co-education exists to a considerable degree.

Secondary education. The aim of secondary education is to provide special knowledge in important subjects like language, social studies, classics, mathematics, art, English, with bifurcation into streams at the higher secondary education stage according to interests and aptitudes. The subjects taught in the secondary schools (including technical schools) are mother tongue, English, mathematics, history, geography, civics, classics, music, and other fine

arts, carpentry, blacksmithing, engineering, etc. The mean age of the secondary school pupils is 11+ to 15+ or 16+ in various regions of the country.

Higher education. There are six universities in the country, two in East Pakistan and four in West Pakistan. All the intermediate (between the secondary and first degree levels) and degree-granting colleges are affiliated to these universities. These institutions for higher education offer courses in arts, science, commerce, technology, medicine and education. The medium of instruction in all of them is English. These colleges and universities admit students who have passed the requisite examinations, preference usually being given to those having comparatively good grades or who have passed with distinction. There is no discrimination on the grounds of sex, colour, caste or creed.

Vocational education. Vocational education is provided in the various technical institutions, and in a few purely vocational schools and colleges, some of which are run by the Department of Education. These institutions provide education of the diploma or certificate standard. The period of courses and qualifications for admission vary from school to school. They conduct their own examinations internally.

Teacher training. There are two types of institutions for the training of teachers: (a) teacher training colleges affiliated to the universities and providing degree courses in teaching (B.T., M.T. now B.Ed. and M.Ed.); (b) teacher training schools and normal schools (or primary training institutes and junior training colleges). In order to meet the acute shortage of teachers, more training institutions are being provided in different parts of the country. A number of primary teacher training schools have been established in East Pakistan in order to meet the growing needs of the schools in the compulsory education areas. Two colleges have also been set up to form teachers for primary teacher training schools.

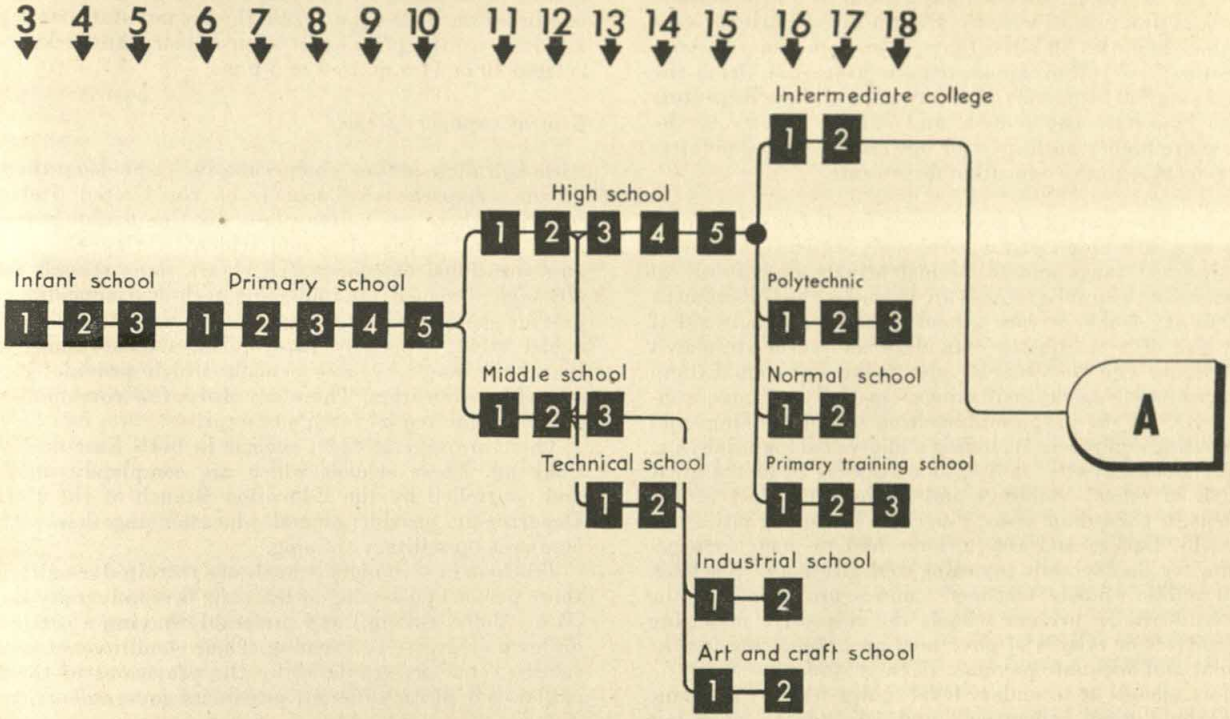
The training colleges prepare teachers for the secondary schools; entrants must be graduates, although in East Pakistan the junior training colleges admit undergraduates also. The primary training schools or institutes and normal schools, which mainly train primary school teachers, admit matriculates. In colleges there is co-education, with only a few exceptions, but normal schools are single-sex. The period of training is 1 academic year in the colleges, and 2 to 3 years in normal schools or primary training institutes. The medium of instruction is English in the colleges and the regional languages in the schools.

Independent schools. There are three types of school outside the recognized school system, managed mostly by private enterprise, although many receive grants-in-aid from the local government: (a) European schools which are affiliated to the Cambridge Local Examinations Syndicate and provide general education through the medium of English; (b) *madrasahs* which provide special education in Arabic, Persian, and Islamic theology through the medium of Urdu; (c) *tols* (in East Pakistan) which teach Sanskrit, Pali and Hindu theology through the medium of Bengali. These schools are gradually becoming less popular. Some of them have already remodelled themselves on modern lines and have adapted themselves to local requirements. They are being assimilated into the recognized school system, e.g. 'new-scheme *madrasah*'. Passing out examinations of the European schools and the new-scheme *madrasahs* are recognized by the universities in Pakistan.

There are also a few colleges of physical training, which give diplomas to the students after their successful completion of the required courses.

In summary, it may be said that in the fields of scientific, technical, vocational and commercial education (e.g. agriculture, engineering, medicine, veterinary science, forestry, textiles, etc.) new facilities have been created with the establishment of several polytechnics, technical and other institutions, and facilities for science teaching have been expanded. In addition to the growth of the training and research facilities within the country, various schemes for training abroad have been in operation, especially under the sponsorship of some international agencies like the International Co-operation Administration (United States of America), Colombo Plan, Ford Foundation, United States Education Foundation, etc.

THE DEVELOPMENT OF SECONDARY EDUCATION



It has already been mentioned that on independence, Pakistan inherited an educational system which had been designed for alien ends. During the first half of British rule in the Indo-Pakistan sub-continent, i.e. until 1857, little was done for education. After the transfer of power from the East India Company to the British Government, the necessity to give some sort of education to the local people who might be useful in the administration of the country was keenly felt; as a result a system of primary and secondary education was developed.

Legal basis

There is no comprehensive piece of legislation dealing with all types and levels of education. The central and provincial governments, however, have enacted laws from time to time to cover specific aspects. These are: (a) the Bengal Primary Education Act, 1919; (b) the Bengal (Rural) Primary Education (East Bengal Amendment) Act, 1951; (c) the Punjab Primary Education Act, 1940; (d) the Sind Primary Education Act, 1947. The several universities in Pakistan have also been established by Statutory Acts. All these laws have considerable bearing on the secondary education system of the country.

Administration

Education is a provincial responsibility, the role of the Central Government being to co-ordinate educational policies throughout the country, and to guide and stimulate planning for educational development on a national basis. The provincial governments discharge their educational responsibilities through the various directorates of their Departments of Education. The chief administrator is the Director of Public Instruction. The departments are responsible for the planning and policy of education in

GLOSSARY

NOTE. This diagram does not show the regional variations in different parts of the country. The duration of the complete school course (primary and secondary) is 10 years in all provinces, except Sind where it is 11 years.

art and craft school: equivalent to *industrial school.*
high school: general or vocational secondary school leading to matriculation examination.
industrial school: vocational training school.
infant school: pre-primary school.
intermediate college: non-degree granting college providing the first stage of higher education.
middle school: lower general secondary school.
normal school: teacher training school.
polytechnic: advanced vocational training school.
technical school: vocational secondary school.

HIGHER EDUCATION

A. University and degree-granting colleges.

their respective provinces (or administrative unit, e.g. Karachi Federal Area). Boards of secondary education have been established in both wings of Pakistan, e.g. the East Pakistan Board of Secondary Education and the Karachi Board of Secondary Education, and the Punjab Board of Secondary Education. These bodies, composed of appointed, nominated, and *ex-officio* members (the latter representing the several Education Departments and universities), are mainly responsible for activities connected with school recognition, examinations, syllabuses, and textbooks. But their specific duties and responsibilities, especially in relation to the district and local boards, or to the education inspectorate, have not been clearly defined. (The Sind and Peshawar Universities also conduct the Secondary Final Examination.) The respective directorates exercise direct control over the secondary education system through grants-in-aid and systematic supervision by a large panel of inspectors. For individual schools, both public and private, there are managing committees responsible for the running of the schools, while in matters of internal administration and control the principal or headmaster has a large measure of autonomy.

There is an elaborate system of inspection for the secondary schools in each province as well as in the centrally administered areas like the Karachi Federal Area. Each Director of Public Instruction (DPI) and his staff of divisional inspectors supervise the district inspectorates, which are the basic administrative units. The provincial directors, the divisional inspectors, and the district inspectors are assisted by deputy and assistant inspectors, whose duties are primarily administrative.

District inspectors and other categories of inspectors of junior rank are recruited from teachers who have the minimum educational qualifications of B.A. together with

a diploma or degree in education as well as a considerable amount of practical experience. But the divisional inspectors and their deputies and assistants, even sometimes district inspectors, are often appointed on promotion from the existing staff of inspectors. The functions of these inspectors are to supervise the schools and submit reports to the immediate higher authority for onward transmission (after any remarks) to the education directorate.

Finance. The sources of government funds for educational purposes, including assistance to needy students, are direct and indirect taxes and occasional private donations. All expenses in the public schools are borne by the Government and most of the private schools receive grants-in-aid if they are of a satisfactory standard and meet stipulated conditions. The Government also makes occasional lump sum grants to various institutions, especially at the secondary level, for the purpose of erecting school buildings and purchasing equipment including audio-visual materials, e.g. maps, globes, charts, radios, etc. There is in fact a great dearth of school buildings and equipment. Most of the schools in the urban areas, especially in the big cities like Karachi, Lahore and Dacca, have had to make arrangements for double shift (morning and afternoon) teaching.

In public schools teachers' salaries are borne by the Government. In private schools the respective managing committees or boards of governors are responsible for the regular and adequate payment of their staff.

Most schools at secondary level charge fees. At the same time they grant concessions and stipends to poor but meritorious students.

School welfare services. Although there is no organized system of school welfare services, the general health services carry out a physical check-up of the students, at least once a year. In addition, milk and some other food is supplied by Unicef and a few other benevolent organizations. There are also arrangements in most of the urban schools for a light mid-day lunch. But the rural school system has no such facilities or arrangements so far. The governments of different provinces are considering the systematic provision of services which will be concerned exclusively with health and social welfare in the schools.

TYPES OF SECONDARY EDUCATION

As the result of the new changes and orientation in the education system of the country, there have sprung up hundreds of secondary schools of different types. In the general category there are high schools and middle schools, the latter sub-divided into lower and upper middle schools. There are polytechnics and technical schools, industrial schools and schools for arts and crafts, and special schools for the handicapped. An idea of the general organization and content of secondary education has been given above in the description of the educational system as a whole.

The academic year coincides with the calendar year in East Pakistan but in West Pakistan it commences in July and continues until the following June. Public schools observe Sunday as a weekly holiday, while private schools remain closed on Friday. Where there is an arrangement of double shift teaching, the first shift begins at 8 a.m. and continues until 12 noon, while the second starts at 1 p.m. and lasts until 5 p.m; in all other schools the working day is from 10 or 11 a.m. to 4 or 5 p.m.

General secondary schools

Although there are no 'comprehensive' schools on the lines of the comprehensive schools of the United States of America, there are active plans for the establishment of multi-lateral types of school which overlap the general and vocational categories. There are some schools which although designed for imparting technical education also provide general education at the secondary level. In the urban areas, especially in Karachi, Lahore and Dacca, there are many evening schools which provide general secondary education. There are also a few correspondence schools organized by foreign enterprises.

There are several cadet schools in both East and West Pakistan. These schools which are completely managed and controlled by the Education Branch of the Defence Department, provide general education together with an emphasis on military training.

Teachers in secondary schools are recruited usually from those persons possessing at least the first university degree (B.A., B.Sc., B.Com.) and preferably having a certificate, diploma or degree in teaching. Their conditions of service, salaries, etc., are regulated by the provisions of the education code of the different provincial governments.

Vocational and technical schools

At the time Pakistan achieved independence, the only institutions providing vocational and technical education were artisan and trade schools, a number of private commercial schools, and some professional colleges of engineering and agriculture which offered 2-year diploma courses. To meet growing needs and requirements, there have been established a few polytechnics and technical high schools in both East and West Pakistan. The duration of the course in these technical high schools is the same as in the general high schools. The subjects taught for the Matriculation examination are English, second language, mathematics, physics and chemistry, and elementary engineering theory and workshop practice.

There are medical schools, various types of technical and commercial schools, arts and crafts schools, etc. Some high schools have provision for teaching agricultural subjects. There are two colleges of home economics, one college of forestry at Abbotabad, and two agricultural and veterinary colleges. These institutions provide education in medicine, agriculture, animal husbandry, forestry, domestic sciences, mechanics and electricity, building trades, mining and metallurgy, textiles, and fine like arts music and dancing.

Mention may be made here of some excellent centres established, managed and controlled by the Defence Ministry for the training of skilled craftsmen to work in its own plants. The PIDC (Pakistan Industrial Development Corporation) has sponsored the Institute of Personal Training, which organizes training within industry programmes both in PIDC and in private plants. Recently the State Bank of Pakistan has also started to provide similar

training facilities for its personnel as well as for recruits who will be absorbed into the staff after successful completion of the required courses of study.

Teacher training schools

Provisions for teacher training have been mentioned in the description of the educational system as a whole.

Other specialized schools

In recognition of the importance of aesthetic education during the formative years, there have been established several schools of art and music, e.g. the Government Institute of Arts at Dacca, the Bulbul Academy of Fine Arts, and some others at Karachi and Lahore. These institutions offer courses in both vocal and instrumental music and other forms of art. The duration of the courses varies from 2 to 5 years. The number of these institutions is increasing.

Out-of-class activities

There has been a tremendous outgrowth of these activities in all the schools of Pakistan. The education directorates are encouraging the schools, both public and private, to make games and sports, literary activities, dramatics, educational excursions, etc., part and parcel of the curricula proper. The students are also given a large autonomy in organizing various activities of school social life. They thus receive training in the actual art of citizenship and have an opportunity to develop facets of their education which are of prime importance.

TRENDS AND PROBLEMS

Pakistan has had to face many educational problems since independence. The Government, in collaboration with leading educators in the country, has been putting forth its best endeavours to solve these problems, and it realizes fully the importance of education in all fields of national life—social, economic, political, moral, cultural and religious.

The various provincial governments have already introduced in some parts of the country a system of compulsory education for all children between the ages of 6 and 11. A fundamental education programme for adults up to the age of 40 has been put into operation with a view to liquidating mass illiteracy.

There is a great dearth of suitable buildings and equipment so that many schools are being run in double shifts in order to provide for more children. Attempts are being made not only to provide more school places but also to raise standards. In order to meet the need for well qualified teachers, many institutes provide training in the most modern methods and techniques, and the subjects of the philosophy and psychology of education have been made compulsory in the teacher training colleges. There is also a system of refresher courses for teachers in service.

In order to keep pace with modern trends in education, several conferences and symposia have been held with a view to devising ways and means of developing the curriculum on modern lines according to the age, ability, aptitude, and interest of the children, with due regard to the local and national needs.

There has been a growing trend to expand scientific and vocational education, thus opening up the agricultural and industrial potentialities of the country, and promoting activities which will lead to a higher standard of living and greater national prosperity.

Finally, the present regime has established a Commission on National Education with a view to devising ways and means for the reorientation and development of education at all levels, primary, secondary and higher. This Education Commission circulated a few months ago a long and detailed questionnaire on education in order to elicit public opinion. It has already submitted its long report to the Government and it is expected that the reorganization it recommends will soon take place.

STATISTICS

Population (mid-year 1958 estimate): 85,635,000.[1]
Area: 364,797 square miles; 944,824 square kilometres.
Population density: 235 per square mile; 91 per square kilometre.

Summary of school statistics, 1953-57. Total enrolment in schools and universities was about 5,700,000 in 1957/58, representing approximately 7 per cent of the total estimated population. In addition there were some 6,000 adults attending literacy courses. Of total school enrolment 74 per cent were pupils in primary schools, 23 per cent in general secondary, 0.2 per cent in technical secondary and 0.1 per cent in teacher training colleges. The remainder were students enrolled in universities (2 per cent) and pupils in special schools (0.7 per cent). The number and proportion of girls enrolled at different levels of education cannot be determined accurately, since an unknown number of girls attending schools for boys are not accounted for. However, the increase of total enrolment in schools for girls over the 5 years under review was striking: 22 per cent in primary schools, 45 per cent in general secondary schools and 12 per cent in vocational education. No data are available for girls enrolled in teacher training schools. Total enrolment of boys and girls increased by less than 9 per cent in primary schools over the years 1953/54 to 1957/58, by 20 per cent in general secondary and by 17 per cent in vocational schools over the same period. Primary school teachers increased by nearly 12 per cent over the years 1953/54 to 1957/58; the proportion of women teachers remained under 8 per cent. The corresponding increase in the number of secondary school teachers was about 20 per cent and women formed nearly 10 per cent of the total in 1957/58. The average pupil teacher ratio in primary schools was 36 and in general secondary schools 25. (See Table 1.)

Examination results in secondary education, 1955-57. The number of students passing the Matriculation or end of general secondary school examination increased from 52,574 in 1955/56 to 60,950 in 1957/58. The proportion of girls to total successful candidates was about 9 per cent in both years. No information is available on number graduating from teacher training institutions or certificates granted to students in vocational schools.

Educational finance, 1957/58. Total expenditure on education in 1957/58 (fiscal year beginning April) was 267,861,128 rupees representing approximately 3.2 rupees per inhabitant and 1.3 per cent of the estimated national income in 1957. Of the total expenditure about 9 per cent was contributed by the Central Government, 63 per cent by provincial governments, 7.5 per cent by local authorities, 12 per cent from tuition fees and 8 per cent from other sources including donations. Capital expenditure was 9.4 per cent of the total spent on education in 1957/58. (See Table 2.)

1. Data are for territory excluding Kashmir-Jammu, the final status of which has not yet been determined, also excluding Junagadh, Manavadar, Gilgit, Balistan and the port and peninsula of Gwadar acquired from Muscat and Oman on 8 September 1958.

Note. In addition to the schools covered here, there exist a great number of non-recognized schools, organized in mosques in rural areas, and taking the form of private English medium schools in urban areas. Their estimated number in 1957/58 was 2,653, with 11,662 teachers and 223,057 students.

1. Figures in this column relate to the number of pupils enrolled in schools for girls, including a small number of boys, but not including a much greater number of girls enrolled in schools for boys.
2. Data on primary classes attached to secondary schools are included under general secondary education.

2. Closed account.
3. Excludes tuition fees from government schools under Karachi Directorate of Education and receipts from non-government colleges in Karachi.
4. Includes scholarships, grants-in-aid and miscellaneous expenditure.

PANAMA

THE EDUCATIONAL SYSTEM

Provisions relating to education in the Constitution of 1 March 1946 are as follows:

'It is a fundamental duty of the State to subserve national education in all its aspects—intellectual, moral, civic and physical. Education in Panama is to be inspired by democratic principles and by the ideals of national progress and human fellowship.' (Article 77.)

'Primary education is compulsory. Public kindergarten, primary, and secondary schooling at all levels and of all types shall be free of charge. "Free" kindergarten and primary education includes an undertaking by the State to provide pupils with all school supplies necessary for their studies. The fact that secondary education is free of charge shall not preclude the fixing of an enrolment fee.' (Article 78.)

'Freedom of teaching is guaranteed. The State shall, nevertheless, be entitled to intervene in private educational establishments to ensure that attainment of the cultural aims of the nation and society and the better intellectual, moral, civic and physical education of the pupils.' (Article 79.)

'No educational establishment shall refuse admission to a pupil on the grounds of his parents' or guardians' irregular union or on grounds of class, race, or political affiliations.

Violation of this rule by a private establishment shall entail the loss of its subsidy, if any, from public funds, withdrawal of state recognition, if accorded, of its diplomas and certificates and, in the event of contumacy, loss of the right to continue teaching.' (Article 80.)

'The teaching of Panamanian history and civics shall in all cases be given by teachers of Panamanian nationality. Teaching shall not be carried on in a foreign language in any private educational establishment without authority granted by the Ministry of Education on substantiated grounds of public interest. The curricula of private primary schools shall conform to those of public establishments, but permits may be granted for the introduction of additional courses in any language. The inclusion of Panamanian history and geography and of civics in the secondary education curricula of private schools shall be compulsory.' (Article 81.)

'The requisite incentives for the publication of Panamanian school books and the standards qualifying the same for official adoption shall be prescribed by law.' (Article 83.)

'The expenditure on education shall have priority over all other. The Organic Law on Education will prescribe the proportion of the revenue to be set aside for this service.' (Article 84.)

'The only recognized academic and professional qualifications shall be those granted by the State or granted state recognition as provided by law.' (Article 85.)

'The official University of the Republic shall be autonomous. It shall have the legal status of a body corporate, with its own endowment and the right to administer the same. It shall be competent to organize its courses and to appoint and discharge its staff in the manner prescribed by law. Its activities shall include the study of national problems and the spread of popular culture.' (Article 86.)

'The State shall promote the establishment of special technical schools for the trades and professions, agriculture and stock farming and commerce, adjusted to the particular needs of Panama. Legislation shall be introduced establishing, from the primary school level upwards, vocational guidance services to enable the aptitudes and capacities of pupils to be brought to light, and individuals to be guided to maximum personal fulfilment and social usefulness.' (Article 89.)

'The State shall promote by all practicable means the pursuit of culture among the masses and shall maintain a scheme of free extension courses for adults for the prevention and elimination of illiteracy and for the instruction of the working classes in practical skills.' (Article 90.)

'Legislation shall be passed setting up a Department of Physical Culture to be responsible for the propagation of this activity in teaching institutions and in the community.' (Article 91.)

'In addition to the general objects of national culture, schools for peasant and aboriginal communities[1] shall further serve the following ends: (a) inculcation of awareness of the duties, rights, dignity and opportunities of the Panamanian citizen; (b) creation of a predilection for country life by objective teaching of the practical rudiments essential for secure, healthy and seemly living in that environment; and (c) carrying into the homes of peasants and aborigines the influence of educational and welfare measures calculated to raise their moral, cultural and social level.' (Article 96.)

The Organic Law on Education (No. 47 of 24 September 1946) gives further expression to these Constitutional requirements and contains notably the following provisions:[1]

'Secondary education at all levels shall be directed towards meeting the economic, physical, civic, cultural and moral needs of society. To this end, the curricula shall take account of the distinctive characteristics of Panamanian children and young people and of their physical and social environment.' (Article 4.)

'Panamanian schools shall be democratic. No educational establishments of an exclusive or sectarian character may operate in the territory of the Republic, nor may any establishment imparting instruction in a language other than Spanish, except in cases provided for under the Constitution.' (Article 5.)

'The Ministry of Education is authorized to lay down educational programmes and to decide on the curricula and organization of the official kindergarten, primary and secondary schools of the Republic, and to establish those which it deems necessary, besides taking steps to see that private schools achieve the ends of national education and culture more satisfactorily.' (Article 7.)

THE DEVELOPMENT OF SECONDARY EDUCATION

Article 133 of the Constitution of 1903 provided that the State should maintain schools of arts and crafts, and secondary and vocational educational establishments. Between 1904 and 1907 the following institutions were founded: a teacher training school for men and another for women; a school of arts and crafts, now known as the Escuela Melchor Lasso de la Vega; a school of music and elocution which became the National Institute of Music; and the School of Nursing. The National Museum, the Pedagogic Library and the National College of Commerce and Industry date from the same period. Law No. 22 of 1909 set up the National Institute which began work on 17 July 1911. Law No. 45 of 1910 established a girls' vocational school which is now co-educational under the name of the Escuela Profesional Isabel Herrera O. The same year saw the founding of the institution which became the School of Fine Arts. Secondary education institutions have continued to be established.

Legal basis

Articles 51 to 71 of the Organic Law on Education (No. 47 of 24 September 1946) relate to secondary, teacher training and vocational education. Articles 72 to 78 are concerned with private education.

All children between 7 and 15 years of age are obliged to attend school (Article 45 of the Organic Law on Education,

1. An ethnic factor affecting the provision of education is the existence of the Indian or aboriginal groups and that of the so-called 'Creoles'. In the province of Bocas del Toro a large part of the population speaks a kind of dialect known as *guaci guaci*.

1. A commission appointed by the Minister of Education is now at work on the codification of educational legislation in Panama.

No. 47 of 1946). The enforcement of these requirements has produced a considerable increase in secondary school enrolments and in the number of secondary schools.

Administration

The Ministry of Education may, whenever it deems fit, convene conferences of professors, inspectors, headmasters and teachers to consider matters relating to education and teaching. In 1958 a special school, the Instituto Fermín Naudeau, was founded to work out methods, etc., which could then be applied in the other schools of the country. The institute has a Department of Psychological Research.

In each municipality there is a municipal education committee (*junta municipal de educación*) of five members, one appointed by the Ministry of Education, two elected by parents' associations, and two elected by the teachers of the district. The function of these committees is to co-operate with the educational authorities in all matters which may contribute to the promotion of culture and education in the district, and to ensure that the proportion —20 per cent—of the municipal funds devoted to education is expended in accordance with the provisions of the present law. All accounts payable against the municipal treasury must bear the signature of the chairman of the municipal education committee.

The Executive shall define the organization and other functions of the municipal education committees. At present, a Bill to reorganize them is under consideration.

Control and supervision. The Second Deputy Minister of Education is responsible for the immediate supervision of all aspects of official and private secondary, vocational and artistic education.

There is only one category of inspectors of secondary education, that of teacher-supervisor. These officials are under the immediate authority of the Directorate of Secondary Education at the Ministry of Education. They specialize in the supervision of particular subjects. For appointment as a teacher-supervisor a candidate must be a secondary teacher, hold a university teaching diploma and have at least 5 years' teaching experience. He is appointed for 2 years; thereafter he may either be maintained in his post or return to teaching.

Under the terms of Article 16 of Decree No. 100 (14 February 1957), a supervisor's duties include: (a) giving guidance and help with regard to the interpretation, adaptation and application of the secondary syllabuses in the subject with which he is concerned; (b) ensuring, through proper guidance, that, in the learning process, the particular objectives of the subject in question are achieved; (c) stimulating and promoting the professional improvement of teachers by means of study and discussion groups, conferences, films, circulars, bulletins and other appropriate supervision techniques; (d) assisting teachers of his subject to appreciate its place in the whole education process so that they may promote and maintain the best possible integration and co-ordination of that subject with others; (e) devoting at least 60 per cent of his time to visits and supervision work in schools and the rest to the preparation of reports, evaluation tests and other activities connected with supervision; (f) reviewing the syllabus with secondary school heads and the teachers of his subject, with a view to proposing any reforms deemed necessary; (g) guiding and assisting the teachers of his subject in the preparation of regular tests to evaluate the pupils' progress, the purpose being to use the results of such tests as an additional means of checking and appraising the teaching, etc.

Finance. Every form of systematic educational work carried out by the State, in whatever institution it may be conducted, is the responsibility of the Ministry of Education and is chargeable to that Ministry's budget. When educational programmes are conducted in institutions coming under some other Ministry, the educational staff are subordinate to the heads of these institutions, except as regards the discharge of their teaching duties.

The State bears the cost of teaching, administrative and auxiliary staff for education, and of the supply of properly equipped premises, textbooks and teaching equipment and materials for the Republic's primary schools. Where secondary schools are concerned, the State is required to provide properly equipped premises, and textbooks and school supplies to the extent that its means allow.

Public secondary education is free. The municipalities are required to assist in promoting and supporting education and the necessary amenities. The proportion of the municipal revenue to be devoted to these purposes, which must be spent within the district, is laid down by law.

Buildings and equipment. Public school buildings are erected by the Ministry of Public Works in conformity with plans drawn up by the Designs and Building Section of that Ministry. No project may be implemented until the Ministry of Education has expressly approved it as satisfying the relevant educational requirements.

When the community provides part of the materials or the labour required, the Ministry of Public Works supplies what is lacking, together with technical guidance and the plans of the school buildings.

School welfare services. For secondary pupils, there are medical, dental, book-lending and school meals services, as well as scholarships for certain categories of deserving pupils. Since 1959, an Educational Guidance Department has begun to function under the Directorate of Vocational Education.

TYPES OF SECONDARY EDUCATION

The school year, consisting of four 2-month terms, begins on 2 May and ends in the last week of January. It thus comprises 180 school days, 5 per week; the school day is divided into eight 45-minute class periods.

General secondary schools

The secondary school course comprises 6 years of study divided into two 3-year cycles. For admission, the official primary school leaving certificate (for the full 6-year primary course) is required. Secondary schools may, however, accept pupils wishing to take particular subjects for which they show aptitude, even if they do not hold a primary school leaving certificate.

According to Article 51 of Law No. 47 of 1946, the purpose of secondary education is to continue fostering and guiding the pupil's all-round development, which began in the primary school; to investigate his aptitudes and interests; and to prepare him, in accordance both with his own capabilities and with the needs of society, to occupy successfully his station in the social life of the community.

In 1955, the Executive appointed a commission to carry out a comprehensive review of all matters connected with secondary education in Panama, its objectives, curricula, programmes, etc. This commission defined the 'specific objectives of secondary education' in the following terms:

1. To develop an understanding of the nation's natural and human resources, its historical, economic and cultural development, the importance, consequences and possibilities of its geographical position, and the social values which give Panama its national individuality.
2. To help adolescents to analyse and interpret objectively the economic, social and cultural circumstances which have had a beneficial or a detrimental influence on society, e.g., the Canal, immigration, the uneven distribution of the population, absentee land-holding in the rural districts, malnutrition and insanitary conditions, the cultural standard of the people, the isolation of large areas which could be productive but are uncultivated, the wealth of Panamanian folklore.
3. To develop the scientific attitude necessary to a study of the problems of the Panamanian community by means of observation, investigation and experiment both in the school and outside.
4. To promote vocational guidance towards, and efficiency in, productive and socially useful activity in national life.
5. To promote the physical and mental health of individuals and groups.
6. To co-operate in maintaining and strengthening family life and to promote human welfare.
7. To develop a taste and appreciation for literature and art.
8. To evaluate and strengthen the political principles enshrined in the democratic system of Panama and set forth in the Constitution and laws of the Republic.
9. To guide adolescents towards the achievement of human values by the consolidation of social and ethical practices in keeping with Panamanian culture, respect for human rights as defined by the United Nations in the Universal Declaration of Human Rights, and the development of a strong civic consciousness.
10. To foster the principles of human fellowship, interdependence and peaceful relations among the peoples through co-operation in the national sphere, the study of cultural similarities among American countries, and a knowledge of the universal values which lead to interaction between cultures.

The lower cycle of secondary education is of a general and exploratory character. A pupil who completes the lower cycle receives a certificate entitling him to admission to the upper cycle. The upper cycle is concerned with academic, professional or vocational specialization. Professional and vocational education are referred to in the section 'Vocational and technical schools' below.

The academic upper secondary cycle (*segundo ciclo académico* or *liceo*) is designed to give the pupil a broader cultural background and at the same time to prepare him for professional and university studies. On completing the academic upper secondary cycle, called the *bachillerato* course, he is awarded the diploma of *bachiller*. No special examination is required for this diploma. The pupil must merely have passed the regular two-monthly and annual examinations held by the school.

Private secondary schools may be 'incorporated' (*incorporadas*) or 'free' (*libres*). They are incorporated if they have adopted the curricula, programmes, textbooks and regulations of state schools at a similar level. If the examinations organized by these schools conform to the regulations of the Ministry of Education, their diplomas or certificates are officially recognized. Free schools are those which do not fulfil the above conditions; their certificates are not officially recognized.

Curriculum. The curriculum of the lower secondary cycle is the same throughout the Republic.

TIME-TABLE OF LOWER SECONDARY CYCLE
(in periods per week)

Subject	Year of schooling		
	7	8	9
Compulsory			
Spanish	4	4	4
Social studies	4	4	4
Science	4	4	4
Health and physical education	3	3	3
Industrial arts, agriculture, domestic economy, business practice	4	4	6
Art	2	(2)[1]	(3)[1]
Music	2	(2)[1]	(3)[1]
Mathematics	4	4	Optional
English	3	3	Optional
Religion and ethics	2	1	1
Total	32	29	25

Optional: general mathematics (4); algebra (4), English (4); business practice (3); native handicrafts (3); social hygiene (3).

1. Art and music are alternatives in grades 8 and 9.

The school week consists of 40 periods of 45 minutes each. A minimum of 92 credits is needed for the lower cycle certificate. (One credit = 1 period per week for a year.)

The curriculum of the upper cycle is shown in the table on the next page.

In order to obtain his secondary school-leaving certificate, a pupil must also pass in one of the following courses: science II, chemistry or physics, each of 5 periods per week, bringing to a total of 61 the number of compulsory class hours for graduation. He may choose one of these three courses in the second or third year of the upper cycle. A minimum of 93 class periods is required for the secondary school-leaving certificate, including the 61 represented by compulsory courses. The maximum number of class-periods a week which a pupil may count as credit in any

year is 33. However, an exception is made in favour of pupils in their final year who need one or two more courses in order to graduate.

TIME-TABLE OF THE ACADEMIC UPPER SECONDARY CYCLE
(*Ciclo de Bachillerato*)
(in periods per week)

Subject	Year of schooling		
	10	11	12
Compulsory			
Spanish	5	5	5
Social studies[1]	5	5	4
Science	5	Optional	–
Health and physical education	2	2	Optional
English	4	Optional	Optional
Art	(3)[2]	(3)[2]	–
Music	(3)[2]	(3)[2]	–
Introduction to philosophy	–	4	–
Interpretation of the social and economic problems of Panama	–	–	4
Total	24	19	13

Optional: mathematics I, II and III (5 periods each); introductory course in surveying (4); technical drawing (4); elements of accountancy (4); science II (5); zoology (4); botany (4); chemistry (5); physics (5); health and physical education III (2); panorama of American poetry (3); introduction to world literature (4); elocution and debating (3); Latin (5); French I and II (5 each); English II and III (4 each); history of America (3); cultural anthropology (4); ethics (4); logic (3).

1. Social studies include the following subjects: 10th year, general geography; 11th year, general history; 12th year, civics.
2. Art and music are alternatives.

Teaching staff. Secondary school teachers are trained in the Faculty of Humanities and Education of the University of Panama. The requirement for admission to the faculty is the secondary school-leaving certificate or the diploma of a primary teacher training school. The 4-year course leads to a degree (*licenciado*) in one of the following specialities: languages, mathematics and physics, biology and chemistry, education, social sciences and philosophy. A further year of specialized study in anyone of these departments leads to a diploma qualifying the holder for a teaching post in a university. The courses and degrees of the independent University of Panama are recognized by the Government as the essential basis for a career in state education.

Vocational and technical schools

A distinction is made between professional education (*educación profesional*) and vocational education (*educación vocacional*). Professional education is given at both the secondary and the university levels. In the former case, it is provided in the teacher training course of the Juan Demostenes Arosemena School, in the commercial departments of the National Institute and of the Isabel Herrera O. School, and in such other institutions as may be specified by the Ministry of Education. At the higher education level, it is provided at the National University. There are also special short courses for holders of the primary school leaving certificate and various courses for adults.

The departments in professional schools corresponding to the upper cycle of secondary education are the 3-year commercial and domestic economy courses. The curriculum of the commercial course includes Spanish, English, commercial arithmetic, basic principles of commerce, typewriting, stenography, accountancy, business machine operation, economic geography, business practice, social and economic problems of Panama.

The object of vocational education is to train pupils for manual trades or to teach them a craft. It is provided in a number of institutions of which the following are representative.

Instituto de Artes Mecánicas (Institute of Mechanical Arts), at Divisa. Its course begins after primary school, and comprises a preparatory year followed by three successive 1-year courses of training for one of five 'occupational areas': building construction; metal work; electricity; automobile and diesel engines; saddlery and ropemaking.

Escuela de Artes y Oficios Melchor Lasso de la Vega (School of Arts and Crafts), near Panama's University City. It is of a higher standard than the Divisa School, constituting, so to speak, the upper cycle in technical vocational education. The areas of vocational training dealt with at this school are the following: general and precision engineering; automobile mechanics and diesel engines; electricity and radio; refrigeration; blacksmithing and plumbing; building, carpentry and cabinet-making; printing; tailoring. The course comprises a general first year which serves to determine the direction to be followed, after which come 3 years of industrial training. In order to enter the industrial school, pupils must have completed the lower cycle.

This school also offers special evening training courses for workers employed during the day. They are variable in length and are organized periodically, in accordance with the needs of industry and the requests made by students. The subjects are surveying, radio, commerce and workshop instruction.

Colegio Felix Olivares. This school provides a vocational course in agriculture in four stages. The first of these is a preparatory year to which pupils who have completed their primary schooling may be admitted; the other three 1-year courses provide vocational training in agriculture.

Instituto Nacional de Agricultura (National Institute of Agriculture). The institute, which is situated 18 miles from the capital, comes under the Ministry of Agriculture, Trade and Industry and is divided into three major departments: the School of Agriculture proper, the National Experimental Farm Station, and General Services. Only pupils who have completed the lower cycle of secondary schooling, are at least 16 years of age and have an aptitude for work on the land are admitted. The 3-year course leads to a certificate in agricultural studies (*bachiller agropecuario*).

Escuela de Enfermería (School of Nursing). This school accepts students who have completed the course at a secondary or teacher training school. It is annexed to St. Thomas's Hospital; the course lasts 3 years and includes both academic and practical work.

Escuela Profesional Isabel Herrera O., near Paitilla. Besides a lower secondary cycle (3 years) and its professional upper secondary courses in commercial subjects and domestic economy, the school also provides a few evening courses in accountancy, dressmaking (making of children's, women's and men's clothes, etc.), pastry-making, beauty culture.

Art education. The National Institute of Music and the Schools of Fine Arts come under the Department of Fine Arts and Publications. They also provide special courses for training teachers of these subjects for primary and secondary schools.

Teacher training schools

Candidates for enrolment in the teacher training course must have completed the lower secondary cycle. The curriculum for the 3-year teacher training course, is shown in the table opposite.

For the award of a primary teacher's certificate, a student must have passed all the compulsory subjects and one of the optional subjects listed in this table.

Out-of-class activities

Secondary schools have literary, scientific and sports clubs. There are also associations of former pupils, the presidents of which have the right to speak and vote at meetings of the Student Welfare Boards. Secondary schools likewise have councils of order and discipline.

TIME-TABLE FOR TEACHER TRAINING SCHOOL
(in periods per week)

Subjects	Year		
	1	2	3
Compulsory			
Spanish	4	4	–
Social studies	4	4	–
Mathematics	4	4	–
Science	4	4	–

Agriculture	3	3	–
Public health	–	–	4
Introduction to education	5	–	–
Growth and development of the individual	5	–	–
Principles and technique of learning	–	4	3
Organization of school work and conduct of a class (1st semester)	–	–	(3)
Appraisal of pupils' progress (2nd semester)	–	–	(3)
Study of the pupil and the community	–	–	2
Preparation and use of teaching materials	–	–	3
Practice teaching	–	–	15
Total	37	36	30

Optional subjects in 3rd year: one subject (4 periods a week) to be chosen from agriculture, native handicrafts, physical education, improvement of living conditions, public health, pre-primary education, music, English.

TRENDS AND PROBLEMS

At the present time, the educational authorities are endeavouring to develop training in farm work in secondary schools. By this means they hope to arouse interest in such work and to bring about a better development of the national economy.

They also intend to give fresh stimulus to the supervisory services by increasing their staff and by providing facilities for the better performance of their duties.

STATISTICS

Population (mid-year estimate): 995,000.
Area: 28,753 square miles; 74,470 square kilometres.
Population density: 35 per square mile; 13 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58 enrolment of full-time pupils, both public and private, reached a total of 179,000, being about 19 per cent of the population. Of these pupils nearly 2 per cent were receiving pre-primary education, 80 per cent were enrolled in primary schools, 17 per cent in schools of the secondary level, and 1.4 per cent were at the university. The proportion of girls was 53 per cent in pre-primary schools and 49 per cent in primary schools; in general secondary schools the proportion rose from 44 in 1953 to 47 in 1957, in vocational schools it dropped from 74 in 1953 to 63 in 1957 and in teacher training schools it increased from 76 in 1953 to 79 in 1957. At the university, girls constituted 45 per cent of the student body in 1957 as compared with 47 per cent in 1953.

The percentage of women teachers was 76 per cent of all full-time teachers (not including the University). Average number of pupils per teacher was 31 in primary schools,

25 in secondary schools, lower stage, and 17 in secondary schools, upper stage. In general, the pupil-teacher ratio was lower in private schools than in public schools. Between 1953 and 1957 total school enrolment increased by 18 per cent; this increase was relatively highest in general secondary education, where the total number of pupils rose by 64 per cent and the number of girls alone by 77 per cent (See Table 2.)

Enrolment trends in secondary education, 1945–57. Between 1945 and 1957, enrolment in general secondary education showed more than five-fold increase. The same is true of teacher training enrolment. Figures on vocational school enrolment show large fluctuations, probably due to the inclusion of some vocational courses for adults in certain years only. Leaving out the vocational school enrolment, Table 3 shows an increase in the secondary enrolment ratio from 9 in the 1945–49 period to 22 in the period 1955–57; including vocational school enrolment, the secondary enrolment ratio for the period 1955–57 would be about 30.

Examination results in secondary education, 1953–57. From Table 4 it may be seen that the number of students passing the *bachillerato* examination had increased markedly between 1954 and 1957, but the increase in the number of commercial school diplomas granted was even more spectacular between 1955 and 1956. The highest number of girls receiving domestic science school certificates was registered in 1956, and the highest number of pupils, both boys and girls, receiving primary school teachers' training certificates were in 1955 and 1956. The proportion of girls receiving various types of diplomas or certificates ranged from 8 per cent (trade and craft schools apprenticeship certificates) to 99 per cent (domestic science school certificates). In regard to the *bachillerato* examination, the proportion of girls was 37 per cent.

Educational finance, 1957. In the fiscal year beginning in January 1957, total expenditure on education by the Central Government amounted to 12 million balboas, averaging 12 balboas per inhabitant. Recurring expenditure accounted for 94 per cent of the total; the distribution of the recurring expenditure by level and type of education is shown in Table 1B.

1. Figures refer to public schools only.

2. In addition, 9 agricultural school diplomas were granted in 1957/58.

PARAGUAY

THE EDUCATIONAL SYSTEM

The present Constitution of Paraguay, promulgated in 1940, merely lays down the bases of the country's political organization and broadly defines various rights, obligations and safeguards.

The three articles concerning education read as follows:

'Primary education shall be compulsory and free of charge. The Government shall encourage secondary, vocational and university education.' (Article 10.)

'The safeguarding of public health, the organization of social welfare services, and the moral, intellectual and physical education of young people are fundamental duties incumbent upon the State.' (Article 11.)

'The professions for which formal qualifications are required, the conditions for the award of such qualifications, and the authorities awarding them, shall be defined by statute. The administration and supervision of education are the responsibility of the State.' (Article 20.)

In addition to this, there are a few provisions guaranteeing to all the inhabitants of the Republic the right 'to learn and to teach' and the right to choose a profession, and, in the case of 'teachers and university professors', the privilege of being eligible to serve as deputies or representatives to Parliament—an office from which all state-remunerated officials are normally prohibited.

Paraguay has no single Organic Law on Education, but there are a great many separate laws and decrees containing clauses on education, and under these provisions, services have been created and organized, and regulations governing the various aspects of primary, secondary and vocational education have been established.

With regard to higher education, Law No. 356 of 9 July 1956 established 'the Organic Charter of the National University of Asunción', which is the only university in Paraguay. The most important provision of this law is that declaring the University's independence and its status as a corporation under public law.

Primary education was made compulsory for children from 5 to 14 years of age by the Law of 1896. The Law of 28 July 1909 reduced this period of compulsory primary education to 7 to 14 years of age for children in towns and 9 to 14 years of age for children in rural areas.

Other important laws are as follows:

The Law of 4 November 1924, dividing primary schools into categories—lower, middle and upper, with 3, 5 and 6 grades respectively. This law also contains provisions concerning the curriculum.

The Organic Law of the Teaching Profession of August 1921, amended and amplified by the Law of 25 April 1941.

The Law of 1 August 1931, instituting vocational training schools.

The Law of 28 October 1939, establishing the National Council of Physical Education.

The Law of 13 August 1943, creating the Ministry of Education.

The Law of 9 July 1945 governing the organization of the Ministry and defining its sphere of work. It established the three following categories of bodies: (a) administrative bodies, including the *Secretaría* or office of the head of the administrative branches of the Ministry, and the various departments and divisions; (b) executive bodies, including all educational institutions, co-operating bodies and those concerned with cultural extension work, coming under the immediate jurisdiction of the Ministry; and (c) bodies co-operating with the Ministry, i.e., the Council of Primary Education and Teacher Training, the Council of Secondary and Vocational Education and the various advisory committees, such as the Educational Reform Committees.

At the present time, the Ministry of Education comprises the following departments: the Department of Research in Educational Psychology, the Department of Primary Education, the Department of Fundamental Education, the Department of Teacher Training, the Department of Secondary and Vocational Education, the Department of Higher Education and Cultural Extension, the Department of Physical Education, the Department of Educational Statistics, the Department of School Buildings, and the Department of Administration.

The Departments of Primary Education, Fundamental Education, Teacher Training, and Secondary and Vocational Education have a corps of inspectors to guide and supervise activities in the type of education or educational establishment for which they are respectively responsible.

Under Article 2 of Decree-Law No. 9470 of July 1945, the duties of the Ministry of Education are as follows: (a) to organize, direct and supervise the educational and cultural extension bodies administered directly by it; (b) to direct and supervise the intellectual, moral, vocational and physical education provided by educational institutions in general; (c) to encourage private initiative in the fields of education and culture; to co-ordinate, in the public interest, the activities of private institutions and to exercise the necessary supervision over them; (d) to stimulate interest in, and a taste for, reading, scientific, literary and artistic studies, works and applications; (e) to safeguard the nation's historical, artistic and cultural heritage; (f) to promote studies and research on the country's cultural situation and seek ways of improving and developing the educational system; (g) to stimulate teacher training; (h) to promote and co-operate in intellectual exchanges, both within and without the country; (i) to see that steps are taken to inculcate and develop in children and young people a love of work, public spiritedness, devotion to the nation's ideals and a sense of human brotherhood, in conjunction with a true understanding of social life.

The political structure of Paraguay is that of a unified Republic; and this has always been so since the country's

independence was proclaimed on the night of 14 May 1811. But it is worthy of note that Paraguayan unity is due not only to the country's political structure: other factors have contributed to its homogeneity. Provincial antagonism or regionalism is unknown, nor is there any ill-feeling towards the capital city on the part of other towns or the rural population. The fullest possible racial integration has been achieved: out of a total population of 1,500,000 inhabitants, the Indians represent only 2 per cent. The country is predominantly rural, yet 75 per cent of the population, without counting the 200,000 inhabitants of Asunción, lives in the vicinity of the capital, within a radius of 120 miles, representing hardly 13 per cent of the whole territory. Linguistically, too, there is considerable unity since, although the entire population does not speak Spanish, it can be claimed that there is no Paraguayan unable to speak Guarani. Three-quarters of the population of Asunción and about half the rural population are bilingual. As regards religion, practically all the inhabitants are Roman Catholics. The Constitution lays down that the Roman Catholic and Apostolic faith shall be the state religion and that the President of the Republic shall be of that faith. Nevertheless, since religious tolerance is guaranteed under the Constitution, many Protestant churches and places of worship of other creeds also exist.

Circumstances have led to complete centralization, the whole country being administered by the Central Government and the local authorities being left only a very small margin of administrative responsibility. In the field of education, therefore, all laws, provisions, programmes and curricula are the same throughout the country and the whole system comes under the central educational authorities.

The State is responsible for the great majority of the country's educational institutions; private schools account for less than a quarter of the total number, but they are fully protected, both by law and in practice. Under Decree-Law No. 387 of 20 September 1943, the Ministry of Education is responsible 'for supervising private schools'. When the latter acquire 'incorporated' status, they follow the official syllabuses and curricula and the general regulations applying to state schools; they are subject to supervision by the ministerial authorities and their end-of-year examinations must be held with the assistance of a ministerial inspector. The Council of Secondary and Vocational Education includes two heads of incorporated private secondary schools among its members; similarly, private schools are represented on almost all the advisory committees, such as the Educational Reform Committees.

The structure of the school system is shown in the diagram on page 935.

THE DEVELOPMENT OF SECONDARY EDUCATION

Both situated in Asunción, Paraguay's two principal secondary schools—one for boys and the other for girls—were legally established by a Decree of 7 March 1870, enacted by the Provisional Government set up after the War of the Triple Alliance; this decree did not, however, come into force until 1877. In 1889, national secondary schools (*colegios nacionales*) were opened in other parts of the country.

The Secondary and Higher Education Law was passed on 24 September 1889. Article I of this law reads: 'The main objective of secondary education is to equip young people with a knowledge of science and art which will give them a basis for embarking on a career and for acquiring sound and specialized knowledge in their subsequent vocational training.'

This law also established the Council of Secondary and Higher Education, which was abolished in 1929, when secondary education was brought directly under the Ministry of Education; this situation lasted until 1931, when a financially and administratively autonomous body, known as the 'Council of Secondary Education', was set up 'to supervise and administer secondary schools'.

Other innovations introduced by the Law of 1889 were the creation of the post of Inspector responsible for the general supervision of secondary schools, and the establishment of the diploma of Bachelor of Science and Arts (*Bachiller en Ciencias y Letras*), obtainable upon completion of the 6-year general secondary school course, and of equivalent diplomas for students having completed special courses in accountancy or other technical branches.

In December of the same year, regulations containing clauses on secondary and commercial education were issued

GLOSSARY

ciclo básico: lower cycle of general secondary studies common to nearly all types of school at secondary level; may be organized as a separate *liceo* (lower general secondary school) or as a department of a 6-year school.

ciclo de bachillerato: upper cycle of general secondary studies leading to the secondary leaving certificate (*bachillerato*).

colegio de humanidades: complete general secondary school.

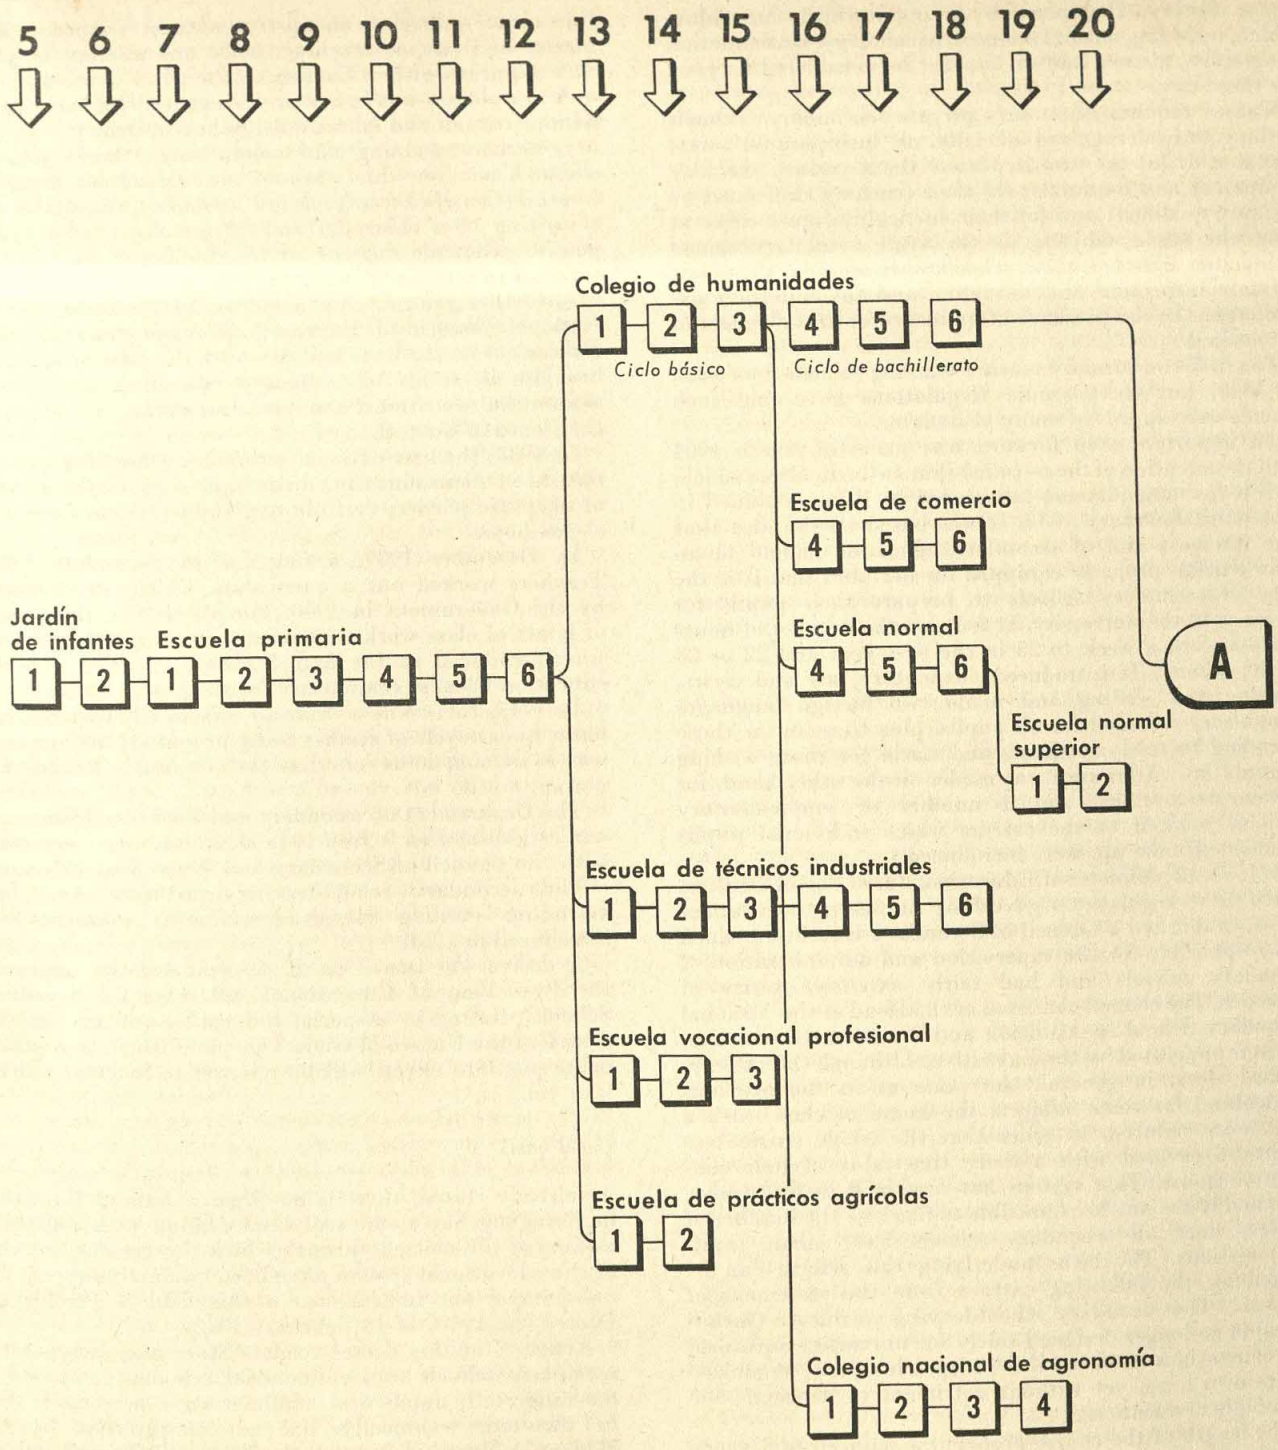
colegio nacional de agronomía: vocational secondary school of agriculture.

escuela de comercio: vocational secondary school of commerce.

escuela de prácticos agrícolas: vocational training school of agriculture.

escuela de técnicos industriales: vocational secondary school preparing for industrial occupations.

escuela normal: teacher training school.



escuela normal superior: teacher training college.

escuela primaria: primary school; grades 1 to 3 form an *e.p. inferior*, grades 1 to 5 an *e.p. media* and grades 1 to 6 an *e.p. superior.*

escuela vocacional profesional: vocational training school for industrial occupations.

jardín de infantes (kindergarten): pre-primary school.

A. *Universidad Nacional:* The National University, with Faculties of Philosophy, Law and Social Sciences, Economics, Physics and Mathematics, Chemistry and Pharmacy, Medicine, Dentistry, Agronomy and Veterinary Science, Architecture.

under this law. They began by laying down the curriculum which, including natural sciences, psychology, mathematics, geography, history and civics, can be considered as good for those days.

Three requirements for private secondary schools wishing to be recognized officially, or 'incorporated', were introduced: (a) they must possess the necessary teaching equipment and materials; (b) their teaching staff must be suitably qualified; and (c) their curriculum must cover at least the same subjects as the state secondary school curriculum. Further, these schools were required to submit to state inspection and discipline and to hold their examinations in the presence of an inspector or a delegate of the council.

The first two primary teacher training schools date back to 1896, but the Organic Regulations governing such schools were approved many years later.

An important step forward was made in March 1904 with the adoption of the so-called Franco Curriculum, which, with a few amendments introduced in 1915, remained in force until February 1931. It was based on the idea that 'the foremost aim of secondary education should be to train citizens properly equipped for life' and that it is the duty of secondary schools to prepare their pupils for entrance to the university. It reduced the number of hours of class work a week to 25 in the first year and 22 or 23 in the second. It introduced elementary law and civics, drawing and writing and made two foreign languages compulsory—French for all pupils, plus German for those intending to study medicine and Latin for those wishing to study law. Allowance was made, on the other hand, for certain exemptions, and a number of supplementary subjects, related to the careers which individual pupils intended to take up, were introduced.

In 1931, the Minister of Education, Justo Pastor Benítez, issued new regulations governing secondary education. These established a Council of Secondary Education which was responsible for the supervision and administration of secondary schools and had fairly extensive terms of reference. The council consisted of the Head of the National Secondary School in Asunción and four secondary school teachers appointed by the Executive. Although the subjects studied were, in general, the same as in the previous curriculum, for some subjects the hours of class work a week were reduced, in order that the whole curriculum might be covered with a daily time-table of four consecutive hours. This system has remained in force since then and it has not been possible to increase the number of classes, since all secondary schools have single (half-day) sessions. The ideas underlying this reform can be judged by the following extract from the statement of reasons: 'The secondary school-leaving certificate (*bachillerato*) is no longer designed solely for university entrance; the course is a more or less independent one, organized on its own lines, yet without detriment to its connexion with higher education . . .'.

The length of the course proper was reduced to 5 years, but, over and above this, a sixth 'preparatory' year, divided into two streams, was introduced. These two streams were as follows: (a) humanistic studies—world literature, Latin, general history, logic, composition and exposition, and the teaching of humanistic studies; (b) science—physics, chemistry, natural science, mathematics and science teaching. Only one modern language was required—either English or French.

A new decree was issued on 6 August 1936, bringing the administration and educational policy of primary, secondary, teacher training and commercial schools under a single head; for this purpose, an Education Board of Control (*Consejo Directivo de la Enseñanza*) was established, consisting of a chairman and 10 members, who had to possess academic degrees, or be qualified accountants or teachers in teacher training schools.

A further reform, in November 1937, established the National Council of Education (*Consejo Nacional de la Educación*) on the lines laid down by the Law of 1899, and brought all forms of secondary education, i.e. general, commercial, vocational and special secondary schools, under the Board of Control.

In 1938, the first national secondary school for girls was opened in Asunción; the curriculum, save for the addition of domestic science, first aid and child care, was the same as for boys.

In December 1939, a Congress of Secondary School Teachers worked out a curriculum which was approved by the Government in 1940. For all classes, the number of hours of class work a week was raised to 30, and Latin was introduced in the first 5 classes. Further, physical education became compulsory for the whole 6 years.

In 1945, there was a drive to reform the curriculum, a basic 4-year cycle of studies being proposed; the oppostion was so strong, however, that the proposed changes were not approved.

The Department of Secondary and Vocational Education was established on 9 July 1945 as a body for co-operation with the Council of Secondary and Vocational Education.

The secondary school-leaving certificate for pupils attending evening classes (*bachillerato nocturno*) was introduced in 1951.

A decree was issued on 27 December 1956, approving the New Plan of Educational Activities for Secondary Schools, drafted by a special Reform Committee with the advice of the Unesco Mission. This plan, which is gradually being put into effect, will be referred to in greater detail later on.

Legal basis

As already stated, there is no Organic Law of Education in Paraguay but a series of laws dealing with particular aspects of the matter, through which the various branches of the educational system have been gradually shaped. The most important instrument in this field is Presidential Decree No. 11089 of 18 February 1942.

Article 2 of this decree reads: 'State and incorporated secondary schools and commercial schools, composed of teaching staff, pupils and administrative personnel, shall be directed, technically and administratively, by the Education Board of Control, the Teachers' Council and the head of each institution'.

Under Article 3, the aforesaid schools are subject to supervision by a Council of Secondary and Vocational Education and come under the jurisdiction of the Department of Secondary and Vocational Education.

The board is composed of the following members: the Director of the Department of Secondary and Vocational Education, as chairman, the head of the National Secondary School in Asunción, the head of the Vocational School in Asunción, two heads of incorporated secondary schools, a secondary school teacher, elected as representative of teachers serving in state secondary and vocational schools, a representative of the National Council of Physical Education, a representative of the Ministry of Public Health and Social Welfare, a representative of the parents.

Since the period of compulsory schooling ends at 14 years of age and begins at the age of 7 for children resident in the towns and 9 for those living in the country, it does not, in practice, extend beyond primary education and does not influence enrolment and attendance at secondary schools. However, although the percentage of pupils going on to a secondary school after completing the primary course is still small, there is a general desire among the public, especially since the recent educational reform, to have an establishment offering at least the basic (lower) secondary school course in every population centre of a certain size.

Administration

The general direction of secondary education is the responsibility of the Ministry of Education, acting through the Department of Secondary and Vocational Education and the Council of Secondary and Vocational Education. In addition, there are various boards and advisory committees to which technical questions are referred. The most important of these is the Secondary Education Reform Committee, which has been operating for about 4 years and which, with the advice of the Unesco Mission, has worked out the New Plan of Educational Activities for the *colegios de bachillerato* (schools preparing pupils for the secondary school-leaving certificate), as well as for commercial and teacher training schools. Assisted by sub-committees, these committees have drawn up the syllabuses for the various subjects and are coming to be regarded as standing committees for the constant study and revision of curricula and syllabuses.

There are also special sub-committees for the study of textbooks, each consisting of three teachers specializing in the subject concerned; authors are obliged to make any changes proposed by the committees.

The Ministry of Education, through the Department of Secondary Education and various inspectors, is responsible for the general supervision of education. There are no regional or local educational authorities. In each secondary school there is a teachers' council, which is responsible for the school's general educational policy and discipline, a headmaster, and a deputy head. Some secondary schools and courses come under other ministries or institutions, such as: farming courses, which at present come under the university's Faculty of Agriculture and Veterinary Surgery; the Social Service School, which operates under the supervision of the Ministry of Public Health and Social Welfare and trains nurses, midwives and social workers; the Solano López Military Academy and the Acosta Nú Military School, which are under the Ministry of Defence; and the José Eduvigis Díaz Police School, which comes under the Ministry for Home Affairs.

The inspection of schools is carried out by a body of inspectors specializing in particular branches of secondary education. There are no regulations laying down criteria for the selection of the inspectorate and the executive is therefore free to appoint such persons as it deems appropriate to discharge such duties, which merely amount in practice to keeping a check on the technical aspects of secondary schools' work. In addition, they have to report to the Ministry on the administrative aspects.

For the financing of secondary education, the main source of funds—indeed practically the only source—is the national budget, i.e., the public funds allocated annually by the Government. The only other funds available are those provided by the school co-operatives constituted by the parents, who contribute, as their means allow, towards the improvement of school buildings, school equipment and other expenses.

Practically all school buildings are state property. Teachers' salaries are calculated on the basis of teaching hours, at the rate of 60 guaranis an hour.

Small enrolment and examination fees, payable by every pupil in state and incorporated schools alike, add to the schools' financial resources.

TYPES OF SECONDARY EDUCATION

Secondary education in Paraguay is provided by the following types of schools:

Liceos (basic secondary schools). The term *liceo* is now applied to schools which provide only the 3-year basic cycle, common to all secondary schools and following on immediately after the primary school. The *liceo* is not in fact a special type of school; it merely provides the basis for pupils who subsequently proceed to the various other types of secondary schools at which the full secondary course can be taken.

Colegios de bachillerato o de humanidades (complete general secondary schools leading up to the secondary school-leaving certificate or providing pupils with a classical education). The course at these schools lasts 6 years. They prepare pupils, to some extent, for university studies but, under the Reform Decree, the instruction provided is an end in itself: the aim is to educate adolescents.

Commercial schools. These schools provide a specialized training for office workers, bank clerks, cashiers, correspondents, commercial managers, custom-house brokers, etc. This is also a 6-year course; the first 3 years are occupied with the basic course, after which the remaining 3 years are devoted to a general education similar to that provided by the previous category of schools, plus vocational training for the various careers and types of work mentioned above.

Teacher training schools. These again provide a 6-year course for training primary teachers for service in urban or rural schools. As in the commercial schools, the first 3 years are devoted to the basic course, while the last 3 are taken up by vocational training and instruction designed to supplement the general education acquired during the first 3 years.

Vocational guidance to determine the type of secondary education for which pupils are best fitted is only at its beginnings.

All the above-mentioned types of schools are institutions pursuing their own particular aims without being obliged to serve as a basis for higher education; but they do in fact lead to university careers since the faculties are, in general, open to students from any type of secondary school.

The school year begins on the first working day of March and ends during the first fortnight of October, without any intervening holidays, since the winter holiday has been abolished from 1959 onwards. The holiday months are December, January and February. The final examinations are held in November.

There are six periods of class work a day. Save in the case of certain schools which have no classes on Saturdays, classes are held on the six weekdays. The length of each period is 40 minutes. Most schools are organized as single units holding classes in the morning, in the afternoon or in the evening, but there are schools, like the National Secondary School in Asunción, which have three units. There are also some schools—but they are exceptional—which divide up their classes between the morning and afternoon.

General secondary schools

Paraguay possesses only one type of secondary school which does not set out to train pupils for any particular career—the *colegio de bachillerato*. The purpose of these schools is to provide adolescents with such instruction as meets 'the requirements of a modern, democratic and active education and promotes the full and harmonious development of each adolescent's personality', the ultimate objective being 'to raise the cultural level of the Paraguayan people, improving their knowledge both in breadth and in depth'.

The subjects taught, listed in Article 18 of Decree No. 24063 approving the New Plan of Educational Activities for secondary schools, are shown in the following time-table.

The results of school work are assessed by an examination system, the main features of which are as follows:

1. There are two categories of examinations: final examinations, covering the year's work and held at the end of the school year, and two periodical examinations, covering four months' work and held, since 1956, in the second fortnight of June and October.
2. The final examinations are oral and public and last for about 7 to 15 minutes for each pupil. The periodical examinations are generally written, but may consist of practical tests should the nature of the subject permit.
3. For final examinations in state schools, the board of examiners consists of the teacher of the subject concerned and another member of the staff, teaching the same or a similar subject. In incorporated secondary schools, the board of examiners is composed of two state inspectors, one of whom acts as chairman, and the teacher of the subject in the incorporated school, who is entitled to take part in the examination, but who may not give marks exceeding the average of those obtained in the periodical examinations. The examinations are held on the premises of the schools concerned.
4. It is not explicitly stipulated that periodical examinations shall be conducted by the teacher of the subject concerned; however, since incorporated schools are required to send in their pupils' marks and the record of their absences at four-month intervals, and also, at the end of the year, the general averages and failures so that they can be taken into account in the final examinations, it is assumed that the teacher of the relevant subject is allowed to conduct the periodical examinations by himself in state or incorporated schools.
5. In order to sit for the final examination in November, a pupil must be still enrolled at the school—enrolment lapsing if he fails to attend classes—and must have obtained an average of at least 4 (out of 10) in the periodical examinations.
6. The final examinations are marked by the board of examiners, but the marks may not exceed the annual

average by more than 3 points, or be more than 5 points under it, except in the case of total lack of knowledge on the part of the pupil.

Teaching staff. It may be said that, for the time being, there is really no such thing as a career of secondary school teacher, since the only qualification required for teaching in a secondary school is a university degree or the diploma of a bachelor of science and arts or of a public accountant or the equivalent. Nevertheless, some attempts are being made to establish secondary school teaching as a profession. For example, a course of further study for those who have already obtained the diploma of certificated primary school teacher (*maestro normal*) and wish to become secondary school teachers (*profesor normal*) has been introduced in certain teacher training schools. Further, Decree No. 3935 of 5 June 1944, establishing the Escuela Superior de Filosofía, Ciencias, Lettras y Educación (Higher School of Philosophy, Science, Arts and Education) stipulated that one of the purposes of the school was to train secondary school teachers and staff for teacher training schools. To this end, the school, which has now become a university faculty, is divided into five sections, all with a 5-year course of training for secondary school teachers, leading up to a master's degree or doctorate in philosophy, arts, history, mathematics or educational science.

Moreover, the National Institute of Physics and Chemistry, founded two years ago, provides a 3-year course of training (which it is proposed to increase to 4 years) for secondary school physics and chemistry teachers. Lastly, the New Curriculum for Teacher Training Schools, approved by Decree No. 35516 of 13 August 1958, makes the senior teacher training schools responsible for training secondary school teachers of education and psychology, teaching methods and practice, and mathematics, natural sciences, social studies and Spanish in the basic secondary school cycle.

Vocational and technical schools

Commercial schools. The present curriculum includes book-keeping, commercial arithmetic, mathematics, Spanish, English, geography, legal practice, commercial correspondence, civil law, commercial law, finance, administrative law, political economy, and history of civilization and trade.

A new curriculum has been approved by the Reform Committee and now only awaits the approval of the executive. The general trend of the new curriculum is to broaden the general education imparted and to provide an adequate intermediate commercial training (office assistants, book-keepers, etc.), leaving it to the university or a senior college to provide more advanced professional training for public accountants.

Vocational schools for girls. There are many schools, academies and courses providing training in shorthand and typing, secretarial work or handicrafts, domestic science, machine-embroidery, cutting-out and dress-making, etc. These schools do not conform to any definite pattern, the number of courses and years of study and the quality of the teaching varying considerably from one to another. They generally specialize in activities or careers for girls, for which there is at present hardly any requirement, or provision, as regards general educational background.

Agricultural schools. There are five schools which aim at turning out practical farmers. The length of the course is 2 years and candidates for admission are required to have completed their primary schooling.

Of a higher standard but still at the secondary education level is the National College of Agronomy at San Lorenzo, a few miles from the capital city. The course here lasts 4 years; the curriculum for each year, and the number of hours per week allotted to each subject are as follows:

1st year: Geography of Paraguay, 2 hours per week; Spanish, 3; Arithmetic, 4; General botany, 3; Zoology, 3; Inorganic chemistry, 3; History of Paraguay, 2; Physics and meteorology, 3; Artistic and geometrical drawing, 2.

2nd year: Hygiene and first aid, 2; Animal anatomy and physiology, 3; Special botany, 3; Organic chemistry, 3; General agriculture, 3; General zootechnics, 3; Topography, 2; Rural economy (accountancy and rural administration), 3.

3rd year: Special agriculture, 3; Special zootechnics, 3; Aviculture and apiculture, 3; Horticulture and gardening, 3; Soil conservation, 3; Plant pathology and entomology, 4; Rural buildings, 2.

4th year: Fruit growing, 3; Practical veterinary surgery, 3; Forestry, 2; Dairy farming, 3; Rural industries, 3; Agricultural machinery, 2; Animal nutrition, 3.

Technical schools. For technical and industrial studies, Paraguay has two types of establishment the Vocational Technical School and the School of Industrial Technology. The former, which operates in co-operation with the Servicio Cooperativo Interamericano de Educación (SCIDE) (Inter-American Educational Co-operative Service), trains specialized workers in the following fields: leather work, graphic arts, auto mechanics, cabinet-work, electricity, blacksmithing, general mechanics, plumbing, radio, refrigeration. In addition, the school provides courses in mathematics, algebra, drawing, Spanish and physical training for all the students.

At the School of Industrial Technology, there is a basic cycle of 3 years, followed by another 3 years of vocational training. The following four branches of technology are open to trainees: (a) chemical industries— at the end of this course and after a year's practical work in a factory, trainees qualify as chemical technicians; (b) building industry—a course which leads, after 1 year's practical experience in building, to the qualification of master builder; (c) mechanical engineering—upon completion of the course and after 1 year's practical experience in a workshop, trainees qualify as mechanics; and (d) electricity —on the same basis as the preceding courses, this one enables trainees to qualify as electrical technicians.

Teacher training schools

For the training of primary teachers, there are teacher training schools which, in accordance with the curriculum

approved on 13 August 1958, provide a 3-year course of specialized studies for prospective teachers, following on from the basic cycle (6 years of secondary education in all); kindergarten teachers, after taking their teachers' diploma, are given a special training lasting 1 year. All that has been said applies also to teacher training schools at the secondary level. The basic cycle covers the same subjects and hours of work as in secondary schools in general.

The curriculum for the special course leading to the primary teachers' diplomas is set out below, together with the number of hours per week allotted to each subject.

4th year: Spanish, 2 hours per week; English or French or German, 4; Human anatomy and physiology, 3; Zoology, 2; Geography of Asia, Africa and Oceania, 3; History of Rome and the Middle Ages, 3; Civics and ethics, 2; Art education and other activities, 2; Physical education, 2; Observation of teaching, 4; General psychology, 3.

5th year: Spanish, 3; English or French or German, 4; Biology, 3; Chemistry, 3; Physics, 3; Modern and contemporary history, 3; Physical education and other activities, 2; Pedology, 2; Child psychology, 3; Scientific bases of education, 2; Observations and experiments in educational psychology, 4.

6th year: Spanish, 3; English or French or German, 4; Chemistry, 3; Physics, 2; Cosmography, 2; Political economy, 2; Theory and practice of teaching, 5; Educational sociology, 3; School organization, 3; History of education, 3.

At these schools, the rules governing examinations, admission, teaching staff, etc., are the same as in general secondary schools.

Other specialized schools

The Paraguayan Government has not established any academies of music or fine arts schools which could be classified among secondary education establishments. However, it should be mentioned that a Fine Arts School, where painting is taught, has been operating, as part of the National University in Asunción, since 1957. Further, since 1950, the Municipality of Asunción has been running a School of Dramatic Art, which provides a 4-year course of theoretical and practical training for dramatic art students.

On the other hand, there are many state-aided private academies, schools, courses, and so on, which offer a wide variety of opportunities for training in art.

TRENDS AND PROBLEMS

In the movement for educational reform, encouraged and assisted by the Unesco Mission, particular attention has been devoted to secondary education. With the introduction of the new curricula, secondary education is ceasing to be a mere step towards university entrance and has become an end in itself. The authorities have succeeded in extending and democratizing the secondary school system to such an extent that every community of any size now has, or is clamouring for, at least the basic 3-year cycle. The number of pupils is growing annually, as is also the number of secondary schools, particularly private ones. There is much eagerness to improve the material resources of secondary schools and to see that they are provided with well-trained, efficient teachers. Although there is still room for improvement in the new curricula, they are more in keeping with Paraguay's particular conditions and needs and provide for more practical studies; at the same time, however, a large part of their content remains purely educational. There is an increasingly strong demand for a specialized training which will produce teachers properly qualified both in their own subjects and in educational psychology. It is obviously important to extend the network of vocational training schools by opening new ones. In the near future, when the results of the educational reforms introduced three years ago have been experienced throughout a complete cycle, it will be possible to rectify certain details so as to improve and consolidate school organization.

STATISTICS

Population (mid-year 1958 estimate): 1,677,000.
Area: 157,047 square miles; 406,752 square kilometres.
Population density: 11 per square mile; 4 per square kilometre.

Summary of school statistics, 1953–57. Total enrolment at all levels of education from kindergarten to university was 309,732 pupils in 1957 representing about 19 per cent of the estimated population. Of the total enrolment nearly 93 per cent were pupils in kindergarten and primary schools, 2.6 per cent in general secondary, 2 per cent in technical secondary schools, 0.5 per cent in secondary teacher

training schools and just over 1 per cent in higher teacher training schools and at the National University respectively. Girls made up 46 per cent of enrolment at primary schools, 36 per cent in general secondary schools, nearly 90 per cent in all teacher training courses and 23 per cent at the National University. The entire teaching staff at all levels numbered 12,858 in 1957. The proportion of women teachers in primary schools was nearly 93 per cent in 1955, the latest year for which data are available. In 1957 women teachers formed 42 per cent of the total staff in general secondary schools, and 79 per cent in all teacher training courses but only 3 per cent of university lecturers. The average pupil-teacher ratio was 28 in pre-primary and primary schools, 7 in general secondary schools including part-time staff and 7 in all teacher training courses. Compared with 1953, enrolment increased by 19 per cent in primary schools, 110 per cent in general secondary schools, 98 per cent in teacher training schools and by 53 per cent at the national university. Enrolment appears to have declined at vocational schools over the period under review. (See Table 3.)

Enrolment trends in secondary schools, 1950–57. Over this 8-year period, enrolment at general secondary schools more than trebled but the proportion of girls declined slightly from 39 per cent in 1950 to 36 per cent in 1957. Enrolment fluctuated in vocational schools and fell rather sharply in 1957 compared with the previous year. Teacher training schools at the secondary level continued to expand steadily over the whole period, girls forming between 80 and 90 per cent of enrolment. Between 1950 and 1957 the rate of secondary enrolment to the 15 to 19 age group rose from 8 to 10. (See Table 1.)

Educational finance, 1957. Total expenditure by the Ministry of Education in 1957 (fiscal year beginning in January) was 276,014,640 guaranis, representing approximately 165 guaranis per inhabitant. (See Table 2.)

PERU

THE EDUCATIONAL SYSTEM

The following articles of the Constitution (29 March 1933), still in force, refer to education.

'The protection of the child's physical, mental, and moral health is a primary duty of the State. It defends the child's right to home life, education, vocational guidance and to full assistance in case of abandonment, sickness or misfortune. The State confides the carrying out of the above to suitable technical organizations.' (Article 52.)

'The technical management of education is the responsibility of the State.' (Article 71.)

'Primary education is compulsory and free.' (Article 72.)

'There must be at least one school in every place with a school population of 30. A full primary education shall be provided in every provincial and district capital.' (Article 73.)

'Schools which function in industrial, agricultural or mining centres shall be maintained by the respective owners or undertakings as the case may be.' (Article 74.)

'The State shall foster free education at the secondary and higher levels.' (Article 75.)

'In every territorial department there must be at least one technical school.' (Article 76.)

'The State shall foster the technical training of workers.' (Article 77.)

'The State shall encourage and help maintain pre-primary and post-primary education and schools for retarded or abnormal children.' (Article 78.)

'Moral and civic instruction for children is compulsory and must be inspired by considerations of national advancement and human solidarity.' (Article 79.)

'The State guarantees professional freedom.' (Article 80.)

'Teaching is a public career and enjoys such rights as are fixed by law.' (Article 81.)

'Archaeological, artistic and historical treasures are under state protection.' (Article 82.)

'The law shall fix the minimum revenue to be allocated to education and what annual increases should be envisaged.' (Article 83.)

Role of public authorities

The Minister for Education is the supreme authority in educational matters and is responsible for ensuring compliance with the various statutes, regulations, decrees and resolutions relating to the educational services.

The National Council for Education comprises the Minister of Education, who acts as President, a representative of university teaching elected by the state universities, four representatives appointed by the Government to represent vocational training, primary education, teacher training and secondary education, respectively, together with a doctor and an engineer specializing in educational matters, who are also appointed by the Government. Among its other duties, the council is responsible for maintaining unity in educational matters, including the desired harmony and co-ordination between the various grades and branches. It approves curricula and syllabuses, sanctions the books for use in schools and establishments of higher education, authorizes the inauguration of private schools, etc.

The Ministry of Education comprises the following departments: Department of Primary Education; Department of General Secondary Education; Department of Teacher Training and Special Education; Department of Fundamental and Adult Education; Department of Technical Education and Development of Craftmanship; Department of Administration and Public Relations; Department of Physical Education and Recreation; Department of Culture, Archaeology and History; Department of Equipment and Supplies; and a planning department.

Other bodies concerned with education are the Permanent Advisory Commission for National Education, councils for primary, fundamental, vocational education and the Commission for the Preservation of Archaeological Monuments. Since 1959, there has also been a national educational information and documentation centre.

THE DEVELOPMENT OF SECONDARY EDUCATION

So-called 'intermediate education' (*instrucción media*) had its origin in the law of 1902, which defined its structure and content.

In 1906 the Ministry of Education published a report on secondary education, in two volumes, in which are to be found the adverse opinions on the 4-year system, then in operation, expressed by nearly all the heads and teaching staff of the 'national colleges' (*colegios nacionales*), i.e., the state secondary schools. In 1918 the course of study was increased to 5 years.

Reform of secondary education started in 1948 when, by a Decree of March of that year, the Colegio Nacional 'Nuestra Señora de Guadalupe', a boys' school, was turned into an experimental institution and organically and functionally remodelled, with the establishment of departments for psychotechnology, educational guidance, practical training, examinations, a medico-physical and a welfare service.

By Resolution No. 253 of 11 August 1956, a commission was set up to draft proposals for the reform of secondary studies. It was also decided to reorganize vocational training and to this end a commission was appointed to deal with the following subjects: training in agriculture and animal husbandry, industrial training of boys and girls and commercial education.

The reforms relating to secondary education and vocational training have been applied progressively since

1957. This means that the first-year classes in all secondary schools of the Republic on 1 April 1957 followed the new curriculum, and that the application of the latter is being gradually extended in the following years to cover the whole 5 years of the secondary course. This curriculum and the corresponding syllabuses are of an experimental nature and subject to adjustment at the end of each introductory year. At the end of this process the syllabus for each year of study will become final.

Legal basis

Decree No. 10 of 15 March 1957 defines the nature, aims and objects of secondary education, as well as its duration, structure and the subjects to be studied; it also deals with co-curricular educational activities and the direction and guidance of the student.

The reform of technical secondary education, its objects and structure were approved by Resolution No. 108 of 20 March 1957.

Plans for the reorganization of the various types of vocational secondary education and the corresponding curricula were approved as follows: industrial education for boys—Resolution No. 100 of 15 March 1957; industrial education for girls—Resolution No. 114 of 27 March 1957; commercial education—Resolution No. 115 of 27 March 1957; agricultural education—Resolution No. 116 of 27 March 1957.

By Decree No. 12 of 23 April 1957 approval was given to the plan for the reform of teacher training and its curriculum.

Administration

Control of educational work is in the hands of the Department of Secondary Education, which delegates its functions to inspectors and heads of schools. Financial control is exercised by the Department of Economic Control and Budgets. The department appoints *administradores de bienes y rentas* (bursars) for each institution; these bursars are jointly responsible with the head teachers for the administration of their property and revenue. Auditors of the Department of Economic Control and Budgets pay periodical visits to the country's educational centres.

Supervision and inspection. Decree No. 24 of 19 July 1957 established a system of secondary school inspection. Regulations for the supervision of secondary schools were adopted by Ministerial Resolution No. 5054. Under this resolution the national territory is divided into five regions each headed by a *supervisor de región.*

In order to qualify for appointment as regional supervisor, candidates must be Peruvian by birth; be more than 35 years of age; hold the grade of teacher (first category) in the register of secondary school teachers; have specialized in school inspection; have held the post of head of a comprehensive school (*gran unidad escolar*) or of a Class A national college, for 5 years; have a satisfactory record in educational work; have served for at least 15 years as a teacher in state secondary schools; and have been accepted by a selection board.

Under the above resolution, the staff of regional offices is to comprise, in addition to the supervisor, teachers seconded for service with the inspectorate, the head of the printing and publications department, as well as secretarial staff and other assistants. The clause regarding secondment of teachers means that the heads of comprehensive schools and of national colleges and the senior members of the staff are, in addition to their normal duties, required to collaborate with the supervisor in his work. Furthermore, these heads of establishments are under an obligation to collaborate directly with the supervisors in the duties assigned to them under the regulations in regard to other public and private institutions.

Among other duties, the regional supervisor is required to: (a) ensure compliance with the regulations and all existing laws and provisions on general secondary education; (b) visit the establishments under his jurisdiction at least once a year; (c) render monthly reports to the Department of Secondary Education on those visits; (d) exercise due control over public and private educational establishments; (e) decide on the most appropriate steps for obviating any deficiencies and issue instructions for improving the teaching and administrative practices of educational establishments; (f) foster a team spirit by stimulating the initiative of parents' associations and encouraging cultural and social institutions to take an interest in educational work.

Finance. Under Article 83 of the Constitution, the minimum amount to be appropriated in the national budget for the maintenance and development of education and the percentage of annual increment are laid down by law.

The sources of scholastic funds are as follows: the sums earmarked by the budget of the Republic, which must amount to 12 per cent at least of the national revenue; endowment income; the sums received by national institutions for higher education in the form of ground rents or from perpetual leases; the proceeds of taxes and levies assigned to education; grants by municipalities and other public and private institutions; fees and payment for board and lodging received from pupils at state educational institutions; fines for breaches of the educational laws and regulations.

Buildings and equipment. The Department for School Building is responsible for the design and planning of school buildings and for putting the plans into effect, which is done with money from the national educational fund. Building standards, whether of a technical or educational nature, are laid down by this Department.

School welfare services. Secondary schools have ancillary services, which function in the following fields: social welfare, health and physical education, laboratories, etc., teaching equipment and audio-visual aids (not in general use). Activities under this head are also carried out by parents' associations and old pupils' societies.

TYPES OF SECONDARY EDUCATION

The first three experimental years of the reform scheme, which were concerned with the first or basic cycle of secondary education, have now been completed. This

scheme continues into 1960 with the inauguration of the second cycle, with differentation of studies. Through the Higher Council for Secondary Education, the educational authorities are studying the results obtained as regards the first basic cycle, and are proceeding with the reform scheme in conjunction with other professional bodies. It is hoped that in about five years' time secondary education will be co-ordinated with pre-vocational and technical instruction in a way which will best serve the basic interests, needs, bent and abilities of Peruvian students.

The school year begins on 1 April and ends on 15 December. It comprises 165 working days, with 5½ days of classwork per week.

General secondary schools

General secondary education is provided in national colleges, private colleges, evening and night schools and in the comprehensive schools (*grandes unidades escolares* or GUE). These GUE are intended to meet all the scholastic requirements of the school population of the area they serve, and provide, in addition to a primary and general secondary education, vocational secondary education of a commercial, industrial or agricultural nature, depending on the special character and needs of the district in question. In other words, no one shall be under the necessity to leave his home district in order to obtain the schooling he desires.

In order to qualify for entry into a secondary school the intending pupil must be between 12 and 16 years of age as at his birthday in the year in which he seeks admission, and as attested by his birth certificate, and submit an official certificate attesting the satisfactory completion of the sixth year of primary education. He must pass a test of mental maturity in accordance with the standards laid down by the Decree of 15 February 1949, present a certificate of good conduct, signed by the headmaster of his former school, and be in possession of a certificate of good health issued by the School Health Service.

In accordance with Decree No. 10 (15 March 1957), secondary education constitutes a stage in scholastic education to which every Peruvian adolescent has a right, inasmuch as it represents an important element in his complete training as a human being and as a member of society; it also qualifies him for entry into a profession or for some other gainful occupation.

From the point of view of training an adolescent for a future career, the aim of secondary education should be to bring out his bent or interests, discover where his vocation lies and direct his abilities to the occupation in adult life for which he is best suited by his qualifications and in which he can be of real service to the community.

In the organization of secondary education, the adolescent's personal and scholastic interests should be the decisive factor. One of its main aims should be to teach the pupil to think, that is to say to develop his capacity to observe and reason, to express himself clearly, and to acquire the habits of work and study.

Secondary studies should also pursue the following practical objectives: to provide all adolescents with the general basic culture needed to fit them into Peruvian life; to prepare young people for posts in community services and in commerce; to develop and widen, for those that desire it, the necessary background for more advanced studies.

Secondary education covers a period of 5 years and embraces two study cycles, the first basic and general, which lasts for 3 years, and the second specialized, which lasts for 2 years. The latter contains provision for arts (cultural history, sociology, geography) or science (mathematics, biology, physics, chemistry) or commerce and administration (book-keeping, office practice, correspondence, elementary law). The time-table for all general secondary schools is as follows.

TIME-TABLE OF GENERAL SECONDARY COURSE
(in periods per week)

Subject	Basic cycle (year)			General subjects included in specialization cycle (year)	
	1	2	3	4	5
Spanish and Spanish literature	4	4	4	4	2

Specialized course in arts or science or commerce and administration	–	–	–	8	10
Total	38	38	38	38	38

Guided studies take the following main forms: practical work during the hours allotted to each subject; organized study in the hours allotted to the library with the assistance of the librarian and the advisory teachers; group studies and instruction on efficient study methods.

With a view to completing the normal curriculum of secondary school education, a flexible programme of co-curricular studies is to be laid down covering the following subjects: sociology, civics, religion, fine arts, science, and sport and recreation, without any one of them predominating.

Achievement testing. Assessment of scholastic achievement, school reports, promotion and examinations are the joint responsibility of the directors of studies, assistants, heads of courses and the teachers assigned to the psycho-pedagogic sections (responsible throughout for pupil guidance), and of the educational standards and social welfare sections in each school.

Scholastic proficiency is assessed by means of mental and pedagogic tests designed by the psycho-pedagogic sections with the assistance of classroom teachers. Standardized mental and educational tests are used in Peru to determine intelligence and scholastic progress quotients and for determining the pupil's mental and scholastic efficiency.

At the end of each of the five grades of secondary education, decisions as to the promotion of pupils depend on an appreciation based on objective pedagogic tests, psychological probing, oral and written examinations and other tests applied and assessed by the teachers in the light of the requirements of each subject or speciality.

At the end of his course of specialized study, and provided he has passed in all subjects included in the curriculum, the student receives a *certificado de secundaria completa* (certificate of completion of secondary studies), which qualifies him for admission to any establishment of higher education.

Teaching staff. The training of general secondary school teachers is undertaken, for men, by the Enrique Guzmán y Valle teacher training college at Chosica, and for women by the Monterrico teacher training college; and also by the state universities of Mayor de San Marcos, Arequipa, Trujillo and Cuzco. In addition the Pontificia Catholic University of Peru also gives secondary school teacher training in the different subjects.

In teacher training colleges it takes 4 years to qualify as a secondary school teacher, and the student must previously have successfully completed the secondary school course. At the universities, graduation as a secondary school teacher takes 5 years, 2 in arts or science schools and 3 of specialization. In both cases a thesis must be submitted.

At the end of the 5-year course at the universities, teachers can stay on for a further year to study for their doctorate and thus qualify, after submission of a thesis, for the degree of doctor of education.

Candidates for entry into the teaching profession are admitted annually by teacher training colleges or the universities on the basis of an entrance examination consisting of oral and written tests of their secondary school grounding, supplemented by psycho-pedagogic tests, personal interviews and specific investigation of their outlook, inclinations and aptitude for the teaching profession. In appointments to the state educational service, preference is given to graduates of the teacher training colleges, since their training has been paid for by the State by means of a system of departmental scholarships. Graduate teachers from the universities also undertake to serve in public secondary schools.

Vocational and technical schools

Vocational and technical education is the responsibility of the Technical Education and Craftsmanship Development Department of the Ministry of Education. It enjoys the direct assistance and advice of the Servicio Cooperativo Peruano Norteamericano de Educación, whose specialists assist in carrying out a variety of programmes.

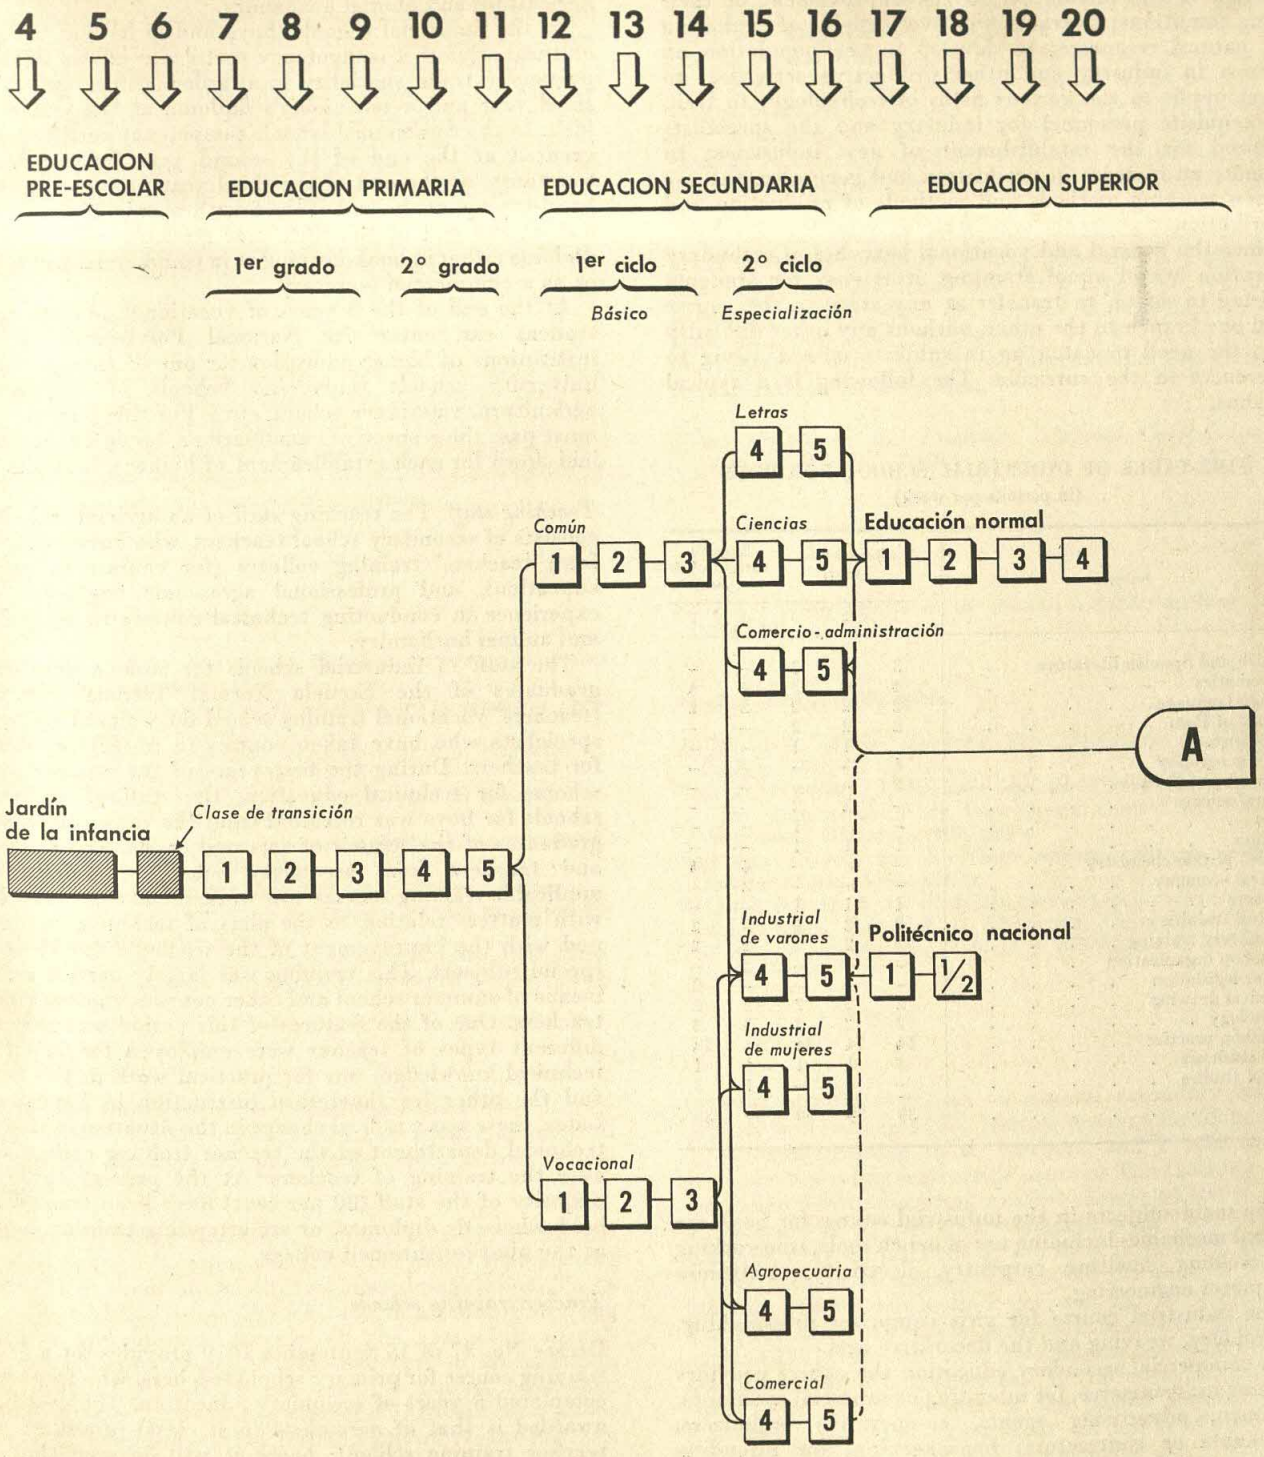
In 1957 a start was made with the application, to the first year of the study cycle, of the reform scheme for vocational secondary education in its four branches, to wit, industrial education for boys; industrial education for girls (home training); agricultural education; commercial education. The institutions providing these courses are known as *institutos* (or *colegios*) *industriales*, *institutos* (or *colegios*) *agropecuarios* and *institutos* (or *colegios*) *comerciales* respectively.

Successful completion of the sixth year of primary studies qualifies for admission to the first year of a vocational secondary course.

The principle of flexibility of syllabuses applies in all four branches. They should be adapted to pupil requirements and the special characteristics of the district in which the school is located.

As is the case with general secondary education, the specialized course takes 5 years, divided into 2 cycles, the first of which provides a 3-year course in basic vocational training for skilled workmen, while the other, which is specialized and takes 2 years, is intended for the training of technicians.

Each of the cycles in vocational education now carries the same weight as the corresponding cycle on the general side. Hence, the general cultural subjects forming part of the basic cycle are the same in both branches, subject to adaptation to the needs of the special course in question.



Among the aims of vocational secondary education,

GLOSSARY

NOTE. The accompanying diagram omits various specialized schools including schools of music and art.

agropecuaria: agricultural course.
ciencias: science course in upper cycle of general secondary school.
clase de transición: infant class forming a transition from kindergarten to formal schooling.
comercial: commercial course.
comercio-administración: course in commerce and administration in upper cycle of general secondary school.
común: general secondary education.
educación normal: teacher training.
educación pre-escolar: pre-primary education.
educación primaria: primary education comprising a first and second stage (*grado*) of 3 and 2 years respectively.
educación secundaria: secondary education, organized in a first or basic cycle (*ciclo básico*) of 3 years and a second cicle of differentiated studies (*ciclo de especialización*) of 2 years.
educación superior: higher education.
industrial de mujeres: technical course for girls.
industrial de varones: technical course for boys.
jardín de la infancia: kindergarten.
letras: literacy course in upper cycle of general secondary school.
Politécnico Nacional (National Polytechnic): advanced vocational training school.
vocacional: vocational secondary education.

mention may be made of the following: to direct the energies of the population to the improvement of their living conditions; to train executives capable of exploiting our natural resources; to develop in the population an interest in industry and other productive activities; to direct pupils to the various fields of technology; to train the requisite personnel for industry and the specialists required for the establishment of new industries; to promote an increase in production and generalize the use of new working methods and methods of production and distribution.

Since the general and vocational branches of secondary education are of equal standing, it is easy for students desiring to do so, to transfer at any stage in the course from one branch to the other, without any other difficulty than the need to catch up in subjects missed owing to differences in the curricula. The following is a typical syllabus.

TIME-TABLE OF INDUSTRIAL SCHOOL FOR BOYS
(in periods per week)

Subject	Basic cycle (year)			Specialization cycle (year)

Total	39	39	39	39	39

The main subjects in the industrial course for boys are general mechanics including use of bench tools, ironworking and welding, smelting, carpentry, electricity, electronics and motor engineering.

The industrial course for girls comprises dressmaking, embroidery, weaving and the decorative arts.

In commercial secondary education the course provides training in: commerce, for intending commercial assistants, salesmen, advertising agents, co-operative organizers, merchants or contractors; book-keeping, for intending cashiers, assistant book-keepers, day book-keepers, book-keepers; secretary-correspondents, as shorthand and copy-typists and commercial secretaries.

The agricultural secondary course comprises training in agriculture and animal husbandry.

In the industrial schools (boys and girls) and the agricultural schools a competency certificate in the student's particular trade speciality is awarded at the end of the third year and a technician's diploma at the end of the fifth. In the commercial schools competency certificates are granted at the end of the second year for commercial assistants, at the end of the third year in copy- or shorthand-typing, at the end of the fourth year in book-keeping, and at the end of the fifth year students may obtain a diploma either in book-keeping or in commercial technology or as a commercial secretary.

At the end of the 5 years of vocational education, the student can enter the National Polytechnic, certain institutions of higher education, or one of the specialized university schools (university schools of engineering, agriculture, veterinary school, etc.). For this purpose they must pass the respective examinations, based on standards laid down for each establishment of higher education.

Teaching staff. The teaching staff of an agricultural school consists of secondary school teachers, who have graduated from teachers' training colleges (for courses in general education), and professional agronomic engineers with experience in conducting technical courses in agriculture and animal husbandry.

The staff of industrial schools for women consists of graduates of the Escuela Normal Técnica Femenina (teachers' vocational training school for women) and other specialists who have taken courses in in-service training for teachers. During the first years of the reorganization scheme for technical education, the staff of vocational schools for boys was recruited from the ranks of artisans, graduates of the schools of arts and crafts, and engineers and teachers from secondary schools. A universally applicable training scheme was worked out concerned both with matters relating to the aims of technical education and with the improvement of the teacher's knowledge of special subjects. This training was largely carried out by means of summer school and other courses, run for serving teachers. One of the features of this period was that two different types of teacher were employed for imparting technical knowledge: one for practical work in the shops, and the other for theoretical instruction in handicrafts. Later, there was a radical change in the situation in that the technical department of the teacher training college took over the training of teachers. At the present time, the majority of the staff (80 per cent) have been trained and hold scholastic diplomas, or are attending training courses at the above-mentioned college.

Teacher training schools

Decree No. 37 of 15 September 1959 provides for a 3-year training course for primary school teachers, who must have completed 5 years of secondary education. The certificate awarded is that of *normalista* (first class) (graduate of a teacher training school); hence it will be seen that the former differentiation between urban and rural teacher training schools is completely eliminated.

Other specialized schools

The Instituto Nacional de Perfeccionamiento Magisterial (continuation school for schoolteachers), which comes under the Department for Teacher Training Schools, is responsible for the in-service and refresher training of serving schoolteachers of all grades. In conjunction with the National Psycho-Pedagogic Institute this body undertakes the in-service training of teachers in psycho-pedagogics; they are required to take a course of at least 2 years. There are also specialized courses in pre-primary school work, pupil guidance and other special subjects required by the Peruvian educational system.

Out-of-class activities

Out-of-class tuition is provided, more particularly during the holiday months, at vacation colonies run by teachers who have specialized in recreational activities and mental and physical health. Radio and television programmes are arranged throughout the school year with the assistance of teachers from non-governmental agencies.

TRENDS AND PROBLEMS

The State, through the Ministry of Education, has laid particular emphasis on the further development of initial and in-service training for primary school teachers, and on refresher courses. There is a marked trend toward the decentralization of primary school teacher training centres and to arrange for courses in the different parts of the country to meet the teachers' wishes for a more convenient implementation of the Basic Scheme for Primary Education.

This trend aims at producing within a comparatively short time duly qualified teaching personnel. Technical and administrative problems still crop up, but are being gradually solved with the further development of the technical assistance programmes which the authorities are initiating with the help of international organizations for educational co-operation.

STATISTICS

Population (mid-year 1958 estimate): 10,213,000.
Area: 496,223 square miles; 1,285,215 square kilometres.
Population density: 21 per square mile; 8 per square kilometre.

Summary of school statistics, 1953–57. In 1957, enrolment at all levels of education was 1,364,100 pupils representing about 14 per cent of the total estimated population. There were in addition some 209,000 adults attending evening primary and literacy courses. Of the non adult school-going population nearly 87 per cent were in kindergarten and primary schools, 8 per cent in general secondary schools, under 2 per cent in technical institutes and about 2 per cent in higher teacher training and university courses. Under half of 1 per cent were pupils in special schools for handicapped children. Girls made up 42 per cent of enrolment at primary schools in 1957 against 40 per cent in 1953 and 36 per cent in general secondary schools, slightly less than in 1953. Women account for 55 per cent of students training to be teachers, and 21 per cent of students attending university courses. The teaching staff, excluding adult education, numbered over 44,600 in 1957, an increase of 23 per cent compared with 1953. Women teachers were 66 per cent of the total in primary schools, 37 per cent in secondary schools, 44 per cent in teacher training courses but only 5 per cent in the universities. The pupil-teacher ratio in primary schools was unchanged at 38 in 1957 compared with 1953, and in general secondary schools, including part time staff, the ratio was 16 compared with 14 at the beginning of the period under review. Enrolment increased strongly at all levels of education between 1953 and 1957 and in particular by 17 per cent in primary schools, 33 per cent in general secondary schools, 38 per cent in vocational institutes, 35 per cent in teacher

training courses and by 59 per cent at universities. (See Table 2.)

Enrolment trends in secondary education, 1947–57. Over the 11-year period for which data are available, average enrolment in all secondary education increased from 71,000 over the years 1947–49 to 101,000 from 1955–57. Enrolment in general secondary schools doubled between 1947 and 1957 and tripled in vocational education over the same period. The ratio of secondary enrolment to the school age population 15–19 years old rose from 9 to 12 during the years under review. (See Table 3.)

Educational finance, 1957. Expenditure on education by the Ministry of Education in 1957 (fiscal year beginning January) was 802,539,580 soles, representing about 81 soles per inhabitant. Of this sum, approximately 12 per cent was for capital expenditure; the distribution of recurring expenditure by level of education is not available, but details of amounts spent on salaries, subsidies and supplies are given in Table 1.

2. General and vocational education.

PHILIPPINES

THE EDUCATIONAL SYSTEM

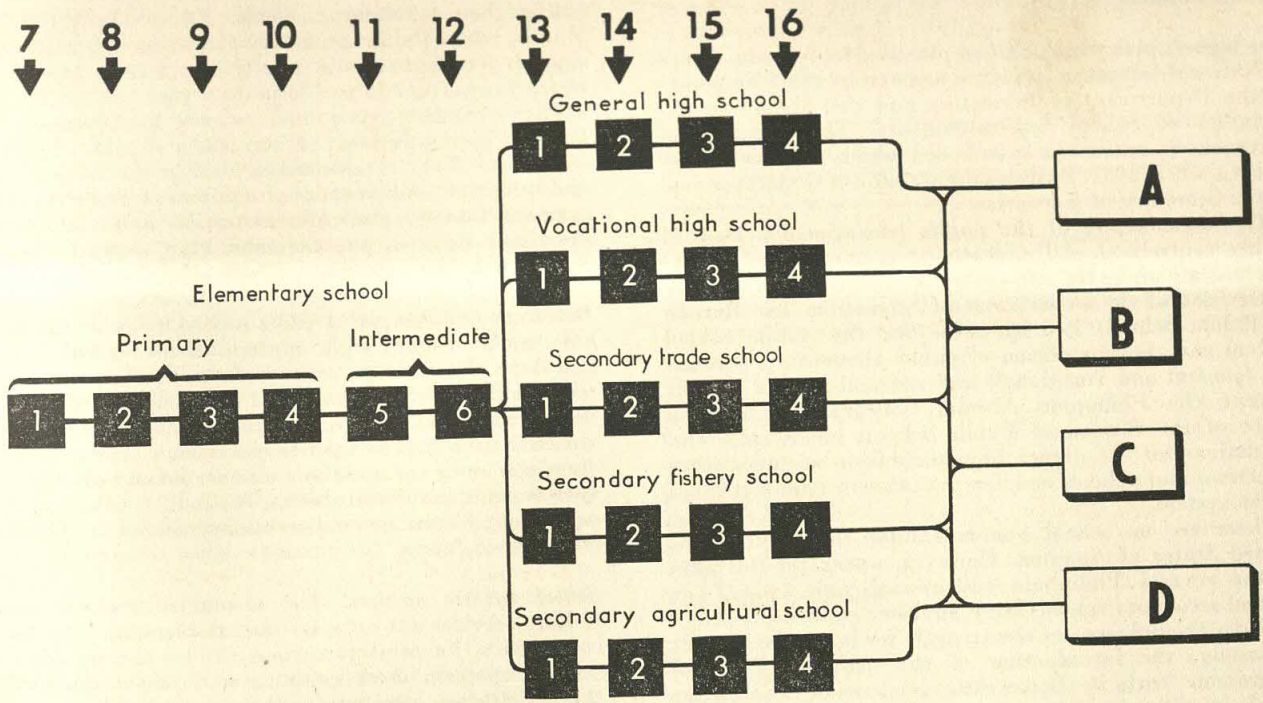
The Constitution of the Philippines provides that the Government shall establish and maintain a 'complete and adequate system of education' with provision for free public primary instruction and for optional religious instruction in the public schools. By constitutional mandate, all schools are dedicated to the development of enlightened, morally upright and vocationally useful citizens who can understand and participate effectively in the functions of a democratic society.

Several factors have, in one way or another, affected the implementation of this statutory measure for education. In view of the number of vernaculars spoken in the different regions and of the growing sense of nationalism among the people, the question of the medium of instruction in schools has given rise to many problems. Again, in the course of its history the Philippines has come under various regimes, each one characterized by a distinctively different government system with its own ideology and educational goals. With each new historical phase the educational system has been re-adapted to the changing political, social, and economic situations in the country.

As provided in the Constitution, all educational institutions are 'under the supervision of and subject to regulation by the State'. The enforcement of this provision is carried out through the Department of Education, which delegates the exercise of its functions to the Bureau of Public Schools and the Bureau of Private Schools. The municipal and provincial governments co-operate with the officials of the Bureau of Public Schools in the promotion of elementary and secondary education. The Bureau of Private Schools sees to it that private universities, colleges, and schools fulfil requirements as regards curricula, grounds, buildings and library facilities, equipment, and qualifications of teachers.

Each general or vocational secondary school makes use of community resources which include government, religious, social and economic organizations. The parent-teacher associations help to provide funds needed to carry out school projects and supply teachers with information of guidance value. The Church also contributes to the guidance of young people and to the development of desirable behaviour patterns. The co-operation of factories, business firms, and other government departments may be enlisted in the implementation of the vocational guidance programme of the school.

The structure of the school system is shown in the diagram on page 953.



THE DEVELOPMENT OF SECONDARY EDUCATION

The Philippine Commission laid the foundation of the public system of secondary education when it passed on 2 March 1902 Act No. 372, entitled 'A general Act for the organization of a Provincial Board to establish free secondary instruction of pupils resident in the province, and to provide for the payment of all expenses of maintaining such public school or schools of secondary instruction'. By virtue of this Act the first high schools, on the pattern of similar schools in the United States of America, were established in 1902. The secondary school curriculum was predominantly academic because of the demand of the students for a course leading to higher education, because of the traditional concept of education in the country, and because of the opportunities such education offered for employment in government service.

After the academic high schools had been in existence for some thirty years, the Monroe Survey Commission pointed out the defects of their curriculum and recommended the establishment of vocational schools to meet the needs of Philippine society. It was found that many students who graduated from the high schools did not have the intelligence or aptitude to profit from college education, yet they had developed a deep aversion to productive labour. While children crowded into the academic high schools in the belief that the type of education they provided was an avenue to power and influence and a badge of membership of the social aristocracy, the vocational secondary school attracted very few students because the curriculum was rigid and failed to provide non-specialized vocational experience. It was generally thought that the students in the vocational schools were weaker intellectually than those in the academic high schools, and this led to social distinctions which were inimical to the democratic way of life. Even the graduates of the vocational schools sought non-manual jobs instead of engaging in the occupations for which they had been trained at school.

Such a condition called for a redefinition of social values. A Committee on the Reorganization of Secondary Education was created in 1931. It recommended the adoption of the general high school (comprehensive high school) embracing all curricula and constituting one unified organization. In an experiment, the Type A curriculum in which exploratory vocational and home economics courses were offered as required subjects received general acceptance. (In the Type B curriculum exploratory vocational and home economics courses were optional.) The Conference on Secondary Education and the Thirty-sixth Annual Convention of Division Superintendents approved resolutions endorsing the Type A general curriculum, and the latter was finally adopted for the first and second years of high school in 1945 and for the third and fourth years in 1946.

The granting of independence to the Philippines and the social and economic changes which affected Philippine life as a result of the World War II called for the further revision not only of secondary education but of the entire educational system. The Board of National Education,

GLOSSARY

elementary school: primary school.
general high school: secondary school with mainly general but partly vocational curriculum.
secondary agricultural school: vocational secondary school of agriculture.
secondary fishery school: vocational training school for the fishing industries.
secondary trade school: vocational training school for industry and trades.
vocational high school: vocational secondary school with multilateral course.

HIGHER EDUCATION

A. University of the Philippines.
B. Non-degree-granting colleges of agriculture, arts and trades, commerce and teacher training, administered by Bureau of Public Schools.
C. Degree-granting public colleges.
D. Private universities and colleges.

which was created by Republic Act No. 1124, recommended a 2-2 plan for the general secondary schools. Under this plan a common general curriculum is offered in the first and second years and a differentiated curriculum—college preparatory course and technical vocational course—in the third and fourth years. The 2-2 plan in the revised Philippine educational programme was adopted when the Department of Education issued Department Order No. 1 (1957).

Vocational education. The improved economic condition of the country at the beginning of the period of American occupation led to the organization of vocational and teacher education alongside the liberal and cultural education provided in the secondary schools. A normal curriculum had been introduced in 1903 to meet the demand for an army of teachers in the expanding public school system. In 1916, 2-year and 4-year normal curricula were adopted. The secondary normal school supplied the bulk of the public school teachers until it was finally replaced by normal schools at collegiate level. The growth of commerce and business led to the organization of vocational courses in this field which were conducted either separately or together with the academic curriculum.

Along with the organization of agricultural schools on an experimental basis in 1904, trade schools were also established in some provincial capitals. Since World War II many more vocational schools have been established, and in view of the importance attaching to vocational education all vocational schools have been nationalized. There are now 52 agricultural schools and 48 trade-industrial schools.

The first school of fisheries was established in 1948 under the Bureau of Fisheries in response to the need for better methods of fishing to conserve the rich fishery resources of the country. In 1957 the 7 schools of fisheries under the Bureau of Fisheries were transferred to the Bureau of Public Schools. There are now 13 schools of fisheries strategically located throughout the islands.

The home economics courses which were introduced in 1918 are now offered in the general high schools, agricultural high schools, trade schools, and fishery schools.

Administration

The highest policy-making and planning body is the Board of National Education, which is assisted by the Directorate of the Department of Education and the Philippine Association of School Superintendents. The selection of textbooks is entrusted to a board which was set up by Act No. 139 in 1937; its decisions are subject to the approval of the Secretary of Education.

The organization of the public educational system is highly centralized. All educational activities and school interests are under the administrative control and executive supervision of the Department of Education. The Bureau of Public Schools is responsible for the public school system and the supervision of public elementary, secondary (general and vocational) and regional normal schools (except the Philippine Normal College). The General Office of the Bureau of Public Schools issues rules and regulations for the proper implementation of educational objectives and policies and for the efficient administration of the system.

There are no school boards similar to those in the United States of America. However, under the 2-2 plan in the revised Philippine educational programme, the general secondary schools have advisory councils.

Under the influence of the struggle for local government autonomy, the introduction of the community school programme with its democratic tendencies, and newer trends in education, there has been a move towards the democratization of school administration. It is believed that the varying conditions existing in the different parts of the country do not warrant the promulgation of uniform rules and regulations. As a result, the field school officials now enjoy a certain degree of independent authority in the administration of the schools under them. Much of the success in the administration of the secondary schools rests upon the secondary school principals, whose position is unique in the school system.

Supervision. The Bureau of Public Schools, through its General Office, closely supervises instruction in the secondary schools. The divisions of instruction, curriculum, research and evaluation, adult education, and vocational education are directly concerned in the supervision of the secondary schools. The General Office maintains a staff of general supervisors, subject supervisors, specialists and curriculum writers who visit schools and render consultant services.

The general and field supervisors are drawn from experienced and successful school administrators and classroom teachers. They must at least hold the degree of Bachelor of Science in Education and must be eligible for appointment as senior teachers.

Finance. By virtue of Section 2111-1/2 of the Revised Administrative Code, general secondary schools are supported by provincial, city or municipal governments with transfers made from the general local authority funds, there being no special tax for secondary education. However, the amount of aid which each high school receives from the local government varies according to the availability of funds and at present very few of the provinces are aiding their secondary schools. Except in the city of Manila, where public secondary education is free, the main support for high schools usually comes from tuition fees, which range from 40 to 135 pesos a year.

The secondary vocational schools are financed from national appropriations, tuition fees and sales of products and assets. They receive aid in kind in the form of books and scientific and vocational equipment from the International Co-operation Administration and the National Economic Council, the Colombo Plan, Unesco, and the Reparations Commission.

Buildings and equipment. Most secondary school buildings have been financed from appropriations for public works and from the contingent fund of the President, especially when it has been a question of replacing school buildings destroyed by national calamities. Some have been constructed from parent-teacher association funds. There are standard plans for academic classes, home economics and vocational or industrial classes. The industrial and scientific equipment in the general secondary schools is purchased from school funds.

School welfare services. The secondary schools provide welfare services not only for the students but also for the community. As projects carried out by the students, the schools operate lunch counters and retail stores where the articles are selected for their nutritional or practical value and sold on a non-profit-making basis. From the school nurseries, selected seedlings are either given free or sold at cost to the public. The schools help in the improvement of community hygiene and sanitation, immunization of animals, and in the dissemination of useful information. School programmes and community assemblies are sponsored by the schools for their social and cultural values.

TYPES OF SECONDARY EDUCATION

Secondary education in the Philippines is classified into general and vocational-technical. The general secondary schools, as has been described in the preceding pages, follow the 2-2 plan prescribed in the revised Philippine educational programme. The revised programme came into effect for first and second year classes in 1957/58, for third-year classes in 1958/59, and for other classes in 1959/60. Some schools have, however, been allowed to postpone implementation of the third and fourth year programmes.

The vocational-technical high schools are grouped as schools of arts and trades, agricultural schools, and fishery schools. Trade and industrial education is offered in the national schools of arts and trades, the nautical school, and the national trade schools. Agricultural education is given in the regional agricultural schools and the agricultural high schools. The national schools of arts and trades and the regional agricultural schools offer both collegiate and secondary courses.

Guidance and counselling services are provided in both the elementary and the secondary schools. Guidance starts as an auxiliary service in the elementary school, but in the secondary school it becomes an integral part of the curriculum. The guidance and counselling programme is the

joint concern of all the teachers, guidance counsellors, school principal, parents, and the community.

Secondary school leavers may go on to college or may enrol in special vocational schools which give short-term courses to prepare them for certain occupations. Fifty-four different vocational courses are being offered in 537 special vocational schools in the Philippines.

The school year in secondary schools is from June to March and is divided into two semesters. The opening and closing dates may vary from year to year, but the total number of school days must remain practically the same (197 or 198). The school week for secondary schools consists of 5 days—Monday to Friday. Official holidays are either fixed by law or established by Executive Order of the President of the Philippines. The fixed or legal holidays include Independence Day (4 July), Bonifacio Day (30 November), Christmas Day, Rizal Day (30 December), New Year's Day, Holy Thursday, Good Friday, Labour Day (1 May) and, varying for each municipality, the town fiesta. There are special occasions, such as Book Week, Mental Health Week, etc., during which classroom activities are synchronized with appropriate programmes and activities.

General secondary schools

The aims of the general secondary schools are based on the fundamental objectives of education as indicated in the revised Philippine educational programme approved by the Board of National Education, to wit: (a) to inculcate moral and spiritual values inspired by an abiding faith in God; (b) to develop an enlightened, patriotic, useful and upright citizenry in a democratic society; (c) to instil habits of industry and thrift, and to prepare individuals to contribute to the economic development and wise conservation of the nation's natural resources; (d) to maintain family solidarity, to improve community life, to perpetuate all that is desirable in our national heritage, and to serve the cause of world peace; (e) to promote the sciences, arts and letters for the enrichment of life, and the recognition of the dignity of the human person.

In conformity with the above philosophy and mandate of the Constitution, the general secondary schools in the Philippines aim to: (a) continue the work of social unification begun in the elementary schools; (b) discover the varying abilities, interests and aptitudes of young people, and offer courses in the different fields of productive endeavour corresponding to such abilities, interests and aptitudes and to the needs of the community; (c) initiate a programme designed to develop community leadership.

The secondary schools should develop vocational efficiency and should also offer courses to the students who will continue their studies in colleges and universities.

Only pupils who have completed elementary school are eligible for enrolment at a secondary school. Some schools, particularly the vocational schools and the secondary schools in Manila, also hold competitive entrance examinations and prescribe other local requirements for enrolment. In each of the 4 years of the secondary school course the students are grouped in sections, the maximum enrolment allowed for each section being 44 for the first year and 50 for the second, third or fourth. Grouping may be based on the ability, social maturity, particular interests or the expressed choice of the pupil.

The general pattern of the 2-2 curriculum in general secondary schools is shown in the following table.

TIME-TABLE OF GENERAL SECONDARY SCHOOLS

(in 40-minute periods per week; where two figures are given, e.g. 3/2, they refer to first and second semesters respectively)

Subject	Common basic course	College preparatory course		Vocational course	
	1st and 2nd years	3rd year	4th year	3rd year	4th year
English	4	9	9	4	4
Character training	1	1	1	1	1

Social science[1]	5	5	5	5	5
Mathematics	5	10	–	5	5
General science	5	–	–	–	–
Biology	–	10	–	–	–
Chemistry or physics	–	–	10	–	–
Applied chemistry	–	–	–	6	–
Applied physics	–	–	–	–	6
Practical arts[2] or home economics[3]	10	–	–	–	–
Vocational specialization for boys[4] or home economics[3]	–	–	–	20	20
Health and physical education[5]	5	5	5	2/3	2/3
Electives[6]	–	–	10	–	–
Total[7]	40	45	45	46	46

1. Covers Philippine community life (1st year of course), Philippine history and government (2nd year), Philippine problems (3rd year) and world history (4th year); the subject also includes one period a week for each year on current events.
2. Agricultural, industrial and commercial arts.
3. Courses available include foods and cookery, food preservation, food service, dressmaking and design, tailoring, laundering, cleaning and dyeing services, handicrafts, home nursing, etc.
4. Chosen from various subject areas including woodwork, practical electricity, horticulture, agronomy, poultry and pig farming, automotive mechanics, retail merchandising, etc.
5. In the third and fourth years includes one period a week of pre-military training for boys.
6. Any two of a large range of subjects, including law, education, oriental history, United States history and government, economics, journalism, engineering, medicine, etc.
7. Religious instruction may be offered as an additional optional subject for three 30-minute periods a week.

No particular method of teaching is prescribed. The principal and the heads of the subject departments help to improve the teaching techniques through classroom visits, conferences with the teachers, and in-service training programmes.

Locally produced standardized achievement tests are administered in the high schools. Evaluative criteria adapted to the conditions existing in Philippine secondary schools have also been prepared. As from the school year 1959/60, national examinations are administered to all fourth year students in public and private secondary schools under the direction of the Department of Education.

On the basis of these examinations, the quality and extent of their class participation and the performance of projects and various classroom and home work, the students

are given periodic ratings in the different subjects. They also are rated on their personal, social and character traits. These ratings are recorded on the monthly report cards which have to be signed by the parents or guardians and returned to the respective teacher advisers. To pass in any subject students must obtain an average mark of at least 75 per cent.

Teachers of academic subjects in the secondary schools are required to possess at least the degree of Bachelor of Science in Education and must pass the Senior Teacher Civil Service examination in order to be given a regular appointment. In the absence of fully qualified applicants there is provision for employment with temporary status. Teachers of vocational subjects should be graduates of a 4-year vocational college (teacher education curriculum, with specialization in courses they are going to teach). Other 2-year or 4-year college graduates may be assigned to teach vocational subjects in the high school if qualified teachers are unavailable. Emergency teachers, employed in the absence of qualified applicants, are required to take courses in some professional subjects in summer classes in order to be retained in the service.

Vocational and technical schools

Preparation for a vocation or occupation may be obtained in schools offering regular vocational courses, such as the trade and technical schools, the fishery schools and the agricultural or rural schools.

Trade and technical schools. The programme is at two levels, secondary and technical. For the secondary trade programme, entrants must be at least 14 years of age and have completed the 6-year general elementary course. The students undergo a 4-year course, specializing in any of the following trades: woodwork and building, metal trades, electricity and electronics, mechanical trades, ceramics, printing and draughtsmanship. On successful completion of this course students may continue their training under the technical education programme. There are 14 secondary trade schools and 33 schools of arts and trades at present. The 4-year secondary trade curriculum is shown in the above table.

TIME-TABLE FOR SECONDARY TRADE SCHOOLS

(in 40-minute periods per week)

Subject	Year			
	1	2	3	4
Shop work	15	15	20	20

Health and physical education[1]	3	3	3	3
Total	35	38	40	38

1. Includes pre-military training for boys. These subjects are given on Saturdays. Under certain conditions scouting is accepted as a substitute for pre-military training and physical education.

Fishery schools. The 4-year secondary fishery curriculum includes English, Filipino language, social science, mathematics, general science, biology, chemistry, physics, fishery, fishery economics and management, health, physical education and pre-military training. Students also spend a minimum of 200 hours per semester (in the first and second years) and 300 hours (in the third and fourth years) in practical work. The course is a terminal one designed to prepare skilled workers for the fishery occupations on a self-employment basis.

Agricultural and rural high schools. The secondary agricultural course lasts 4 years and is open to students who have completed the 6-year elementary school, who are at least 14 years of age and who have passed entrance and aptitude tests. Instruction in the secondary agricultural schools consists of the usual cultural subjects which take up roughly 50 per cent of the time spent in school. The rest is devoted to agricultural courses for the boys and home-making courses for the girls. The boys are given general agricultural training in agronomy or farm crops, horticulture, animal husbandry, and farm mechanics. Only those elementary school graduates who have qualified in entrance and aptitude tests are admitted to the agricultural and rural high schools.

Secondary school graduates who have taken agricultural courses in the high school and have qualified in appropriate entrance tests are enrolled in the 2-year technical agriculture curriculum or in the 4-year agriculture teacher-education curriculum. In the case of the 1-year post-graduate course in farm mechanics, only graduates of the secondary agriculture curriculum who have shown aptitude for this type of work are enrolled.

The Philippine Poultry School, the only school of its kind in the country, located in Sta. Maria, Bulacan, is a secondary agricultural school offering special courses in poultry raising. The curriculum is on the same lines as that of the 4-year secondary agricultural course, agricultural instruction being replaced by courses related to poultry raising. There are plans to convert this school into an animal husbandry school (secondary level) to include courses related to the raising of other animals.

Work experience programmes. Co-operative work experience programmes are available in many secondary schools. Local employers co-operate with the schools in providing opportunities for the students to earn while they learn, by letting them work in shops or other business establishments during their vocational education periods on certain days of the week. To implement the work experience programme more effectively, either the morning or the afternoon session is devoted to academic subjects and the other session to vocational subjects. The scheme leads to the acceptance by vocational teachers and the managers

of industries of joint responsibility in the training of the students who, upon graduation from secondary school, are given first preference for employment in the concerns where they have been trained. Although work experience programmes are still new in the general secondary schools they are rapidly gaining the approval of school administrators, parents and students.

The vocational courses offered in general secondary schools are selected on the basis of the needs, resources and interests of the students and the community. The advisory council to the principal (all high schools are required to organize such councils), consisting of laymen representing different fields of activities in the community, conducts surveys of community resources and helps the principal and the vocational teachers in the choice of the courses to be offered.

Private vocational schools. A total of 27,631 students, consisting of 8,467 boys and 19,164 girls, are enrolled in vocational courses at private schools. These courses cover an extremely wide range of trades and occupations.

Teacher training schools

Teacher education is now at college level. The old secondary normal schools have been converted into collegiate normal schools conferring the degree of Bachelor of Science in Elementary Education; only two schools in Mindanao still offer a 2-year course leading to the Elementary Teachers Certificate.

Other specialized schools

There are no specialized institutions in music and arts at the secondary level in this country. Music courses are being offered in some general secondary schools as electives in vocational education. Courses include choral and instrumental (orchestra and band) music. Art instruction is part of the domestic economy courses for girls and of the handicrafts work in vocational education for boys.

Special secondary schools provide education for the deaf and blind. For the mentally bright students a special curriculum with emphasis on the sciences and mathematics is being offered; this, however, is still at the experimental stage.

There are six experimental-demonstration high schools in the Secondary Education Improvement Sub-Project under the International Co-operation Administration and the National Economic Council assistance programme.

Out-of-class activities

Secondary school students run student governments in their respective schools under the supervision of teachers. Class organizations are also under student leadership. From time to time the student leaders are permitted by the school administrators to participate in the planning, executing, and evaluating of some school policies and projects. Subject clubs and civic organizations are also encouraged in the schools; among them are the Boy Scout and Girl Scout movements, Junior Red Cross, Junior Puroks, pen pal clubs, science clubs, debating clubs, etc.

In addition to group games, mass callisthenics and folk dancing, competitive athletics are also given due emphasis. Divisional, regional, and interschool athletic meetings are held regularly by the Bureau of Public Schools to encourage friendly competitive games. Regional and national athletic meetings as well as interschool competitions are also held by the private schools.

Other co-curricular activities participated in or sponsored by secondary schools are literary and musical programmes, excursions, picnics, camping, field trips, school papers, activi- or balls, community development projects, and civic parties ties. Parents sometimes participate in these activities.

TRENDS AND PROBLEMS

Mention has already been made of the trend towards a more democratic school administration. At the same time the participation of parents and other members of the community is being sought in planning, executing and evaluating school policies and activities, and in curriculum building.

Attention is being given to various ways of raising the standard of teaching, e.g., by increased use of local instructional materials, greater emphasis on functional learning, fuller recognition of the problems and interests of the learners, more effective organization of subject matter, increased use of community resources, etc. Greater emphasis is being given to the teaching of science and mathematics.

One of the great problems in Philippine education is how to establish an effective and stable system of financing general secondary schools. The inadequacy of the present arrangements is attended by such difficulties as lack of suitable buildings, equipment and instructional materials, shortage of staff and overburdening of the teachers in service.

STATISTICS

Population (mid-year 1958 estimate): 24,010,000.
Area: 115,600 square miles; 299,404 square kilometres.
Population density: 208 per square mile; 80 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, total enrolment (not including university students, or adults in evening classes) may be estimated at 4.6 million pupils or about 20 per cent of the total population. Of these pupils, 81 per cent were in primary and intermediate schools; 12 per cent in secondary schools; 2 per cent in vocational schools; less than 1 per cent in teacher training schools; 4 per cent in some form of higher education. The proportion of girls was 48 per cent in primary education, 46 per cent in general secondary education, 41 per cent in vocational education, 82 per cent in teacher training, and 39 per cent in higher education. Women teachers constituted 71 per cent of the teaching staff in public primary and intermediate schools. The pupil-teacher ratio in primary education was 38.

Between 1953 and 1957 pupil enrolment increased by 7 per cent, the highest rate of increase being in higher education, where the number of students in 1957 was one and a half times that of 1953. (See Table 3.)

Enrolment trends in secondary education, 1930–57. Table 4 shows that between 1930 and 1957 enrolment in general and vocational secondary education rose steadily. The replacement of teacher training schools (at the secondary level) by teacher training colleges explains the decline in enrolment at the former. The proportion of girls seems to have decreased in general secondary schools but increased in vocational schools. Despite the disappearance of teacher training pupils, the average total enrolment in the period 1955–57 was more than three and a half times that in the period 1930–34; this increase was not simply due to population growth, for the secondary enrolment ratio doubled over the same period.

Examination results in secondary education, 1953–57. The year 1954/55 set a record in the number of diplomas and certificates granted, the total for 1957 being only 85 per cent of the total for 1954. However, if the 1957 figures are compared with those for 1953, it will be seen that there was an increase of 15 per cent in the number of general secondary school certificates, of 12 per cent in the certificates from arts and trades schools, and of 17 per cent in agricultural and fishery school diplomas. The proportion of girls receiving certificates and diplomas in 1957 was 47 per cent in general secondary education, 27 per cent in arts and trades schools, and 33 per cent in agricultural and fishing schools. More than half of the commercial school diplomas were received by girls. (See Table 2.)

Educational finance, 1957/58. For the fiscal year beginning in July 1957, total recurring expenditure for public schools only (not including universities) amounted to 225 million pesos, averaging 10 pesos per inhabitant. (See Table 1.)

POLAND

THE EDUCATIONAL SYSTEM

The Polish educational system comprises in principle three levels, with three corresponding types of educational establishment: primary schools, general secondary schools or secondary schools for vocational training, and higher educational establishments. There are also kindergartens, which admit children from the ages of 3 to 6, and are attended by about 12 per cent of the children of pre-primary age; institutions of this type are run by the educational authorities, by business or industrial concerns and by social organizations. The structure of the Polish educational system is shown in the diagram on page 963.

Article 61 of the Constitution stipulates that citizens of the Polish People's Republic have a right to education, and enumerates the means by which the exercise of this right is safeguarded.

The current educational system reflects the political and social developments which occurred in Poland towards the end of World War II. The democratization of education went along with socialist inspired changes in political, economic and social relations. The process was marked by the tendency to generalize education, by the expansion of primary schooling, by efforts to facilitate the access of pupils from working and peasant backgrounds to secondary schools, by the institution of all forms of adult education, the trend towards 'unified schooling', the elimination of all traces of privilege and discrimination in education, and finally by fundamental changes in the ideological and educative content of the teaching and in the guiding principles of school curricula.

The Decree of 1956 on compulsory school attendance stipulates that this shall begin in the year in which the child reaches the age of 7 and shall continue until completion of 7 years of primary education, but that it shall not extend beyond the age of 16. (Before the war, the age limit was 14, irrespective of the class in which the pupil was studying when he reached that age.) In exceptional cases, a child may be allowed to begin his schooling either a year earlier or a year later. Children who are unable to attend a normal primary school are obliged to attend a special school.

Under the provisions of the Law of 7 July 1958, adolescents between 14 and 16 who are employed in a business or industrial concern in order to learn a trade or to carry out a period of preliminary work, and who have not completed the 7-year cycle of primary studies, must do so in a primary school for workers. Education is free in all public teaching establishments, irrespective of level. There are very few private schools.

Polish schools are lay schools. The curriculum does not include religious instruction among compulsory subjects and aims at providing young people with a scientific concept of the world. Religion is taught as an optional subject to those children whose parents so desire.

Although national minorities constitute only a small fraction of the population, the State encourages their cultural and educational activities, and provides them with special schools. Schools exist at present for children from the Byelorussian, Ukrainian, German, Slovak, Jewish, Lithuanian and Czech minorities, in principle providing education in the mother tongue of the pupils. Polish is not taught as a separate subject until the second year. Moreover, in certain schools where Polish is the language of instruction but in which there are groups of more than seven children of other nationalities, teaching of their mother tongue may be included in the curriculum at the request of the parents.

Role of the public authorities

The Government of the Polish People's Republic (Council of Ministers) is the supreme executive and administrative organ of the central authorities. It is appointed and dissolved by the Diet, which passes laws and controls the other executive and administrative organs of the State.

The Council of Ministers co-ordinates and directs the activity of the ministries and other bodies under its control; it approves and submits to the Diet the draft economic plans and state budget, and supervises the execution of laws, the carrying out of the national economic plan and the application of the state budget. On the basis of the laws and with a view to their execution, the Council of Ministers passes decrees or adopts resolutions, supervises their application, and directs the work of the presidiums of the People's Councils.

The People's Councils direct the economic, social and cultural activity of the districts for which they are responsible, relating local needs to the general objectives of national policy. Each People's Council elects a presidium, which is an executive and administrative body. It also appoints commissions to deal specifically with its different fields of activity. These commissions maintain permanent and close contact with the population; they mobilize the latter for participation in the accomplishment of tasks set by the council, exercise a social control on its behalf, and submit suggestions to the council and its organs.

For administrative purposes Poland is divided into voivodships and cities with voivodship status, and the voivodships are sub-divided into districts and towns with district status. In the voivodships and in the two largest cities of Poland—Warsaw and Lodz—education comes under a 'curator' who is responsible to the presidium of the People's Council for all matters related to instruction and education in his region. In districts, and in towns constituting districts, as well as in the various quarters of the largest towns, these duties are entrusted to inspectors of education. The curators and inspectors are thus the respective heads of the school regions and school districts. Each inspector organizes and directs the activities of the

most commonly found schools, notably primary schools and schools and courses of general education for adults, but is not concerned with secondary schools. The curator of a school region and his permanent assistant—the assistant curator, who is responsible for technical education—are appointed or dismissed by the Minister of Education, after consultation with the presidium of the competent People's Council. The curator organizes and directs the activity of general secondary schools, teacher training schools, training schools for kindergarten teachers, teacher training courses, technical schools and courses, general secondary correspondence schools and special schools and institutions. He also supervises the work of inspectors, and is the educational supervisor of schools and educational institutions which come under other ministries or non-governmental institutions (with the exception of those directed by the Ministries of Culture and Arts, Agriculture, and Health).

Private education

All primary schools are state controlled and run in conformity with the constitutional principle of universal and free primary education. There are, however, a small number of private secondary schools, which provide general or vocational education (trade schools or domestic science schools).

Private schools are under the supervision of the Ministry of Education. Authorization to open a private school is subject to certain conditions for its satisfactory operation, as defined in a law passed in 1932.

Private schools, which apply appropriate curricula in conformity with the directives and instructions of the Ministry of Education, enjoy the same rights as public schools, and their pupils and former pupils have the same rights as their counterparts in public primary schools of the same level. Private schools are directed by Catholic congregations or by private associations.

Co-operative education

Co-operative education is rapidly developing under the direction of the Central Office of Labour Co-operatives and the Central Office of Agricultural Co-operatives.

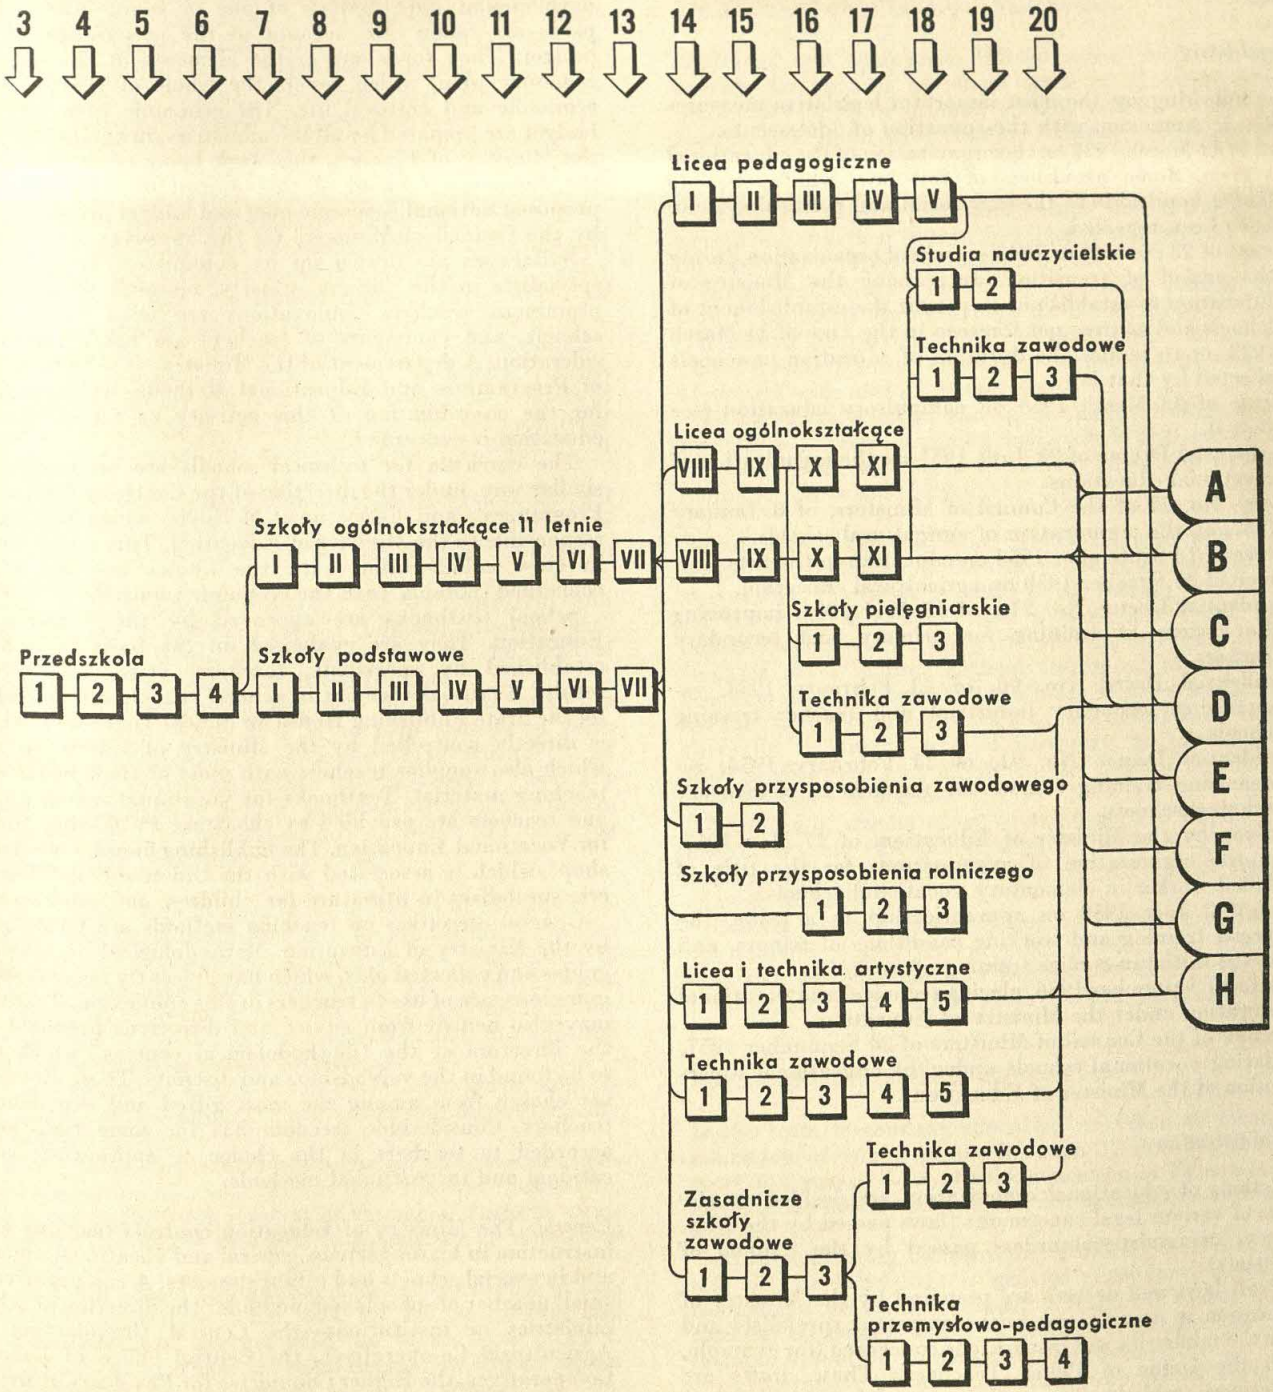
The role of the Union of Polish Teachers

The Union of Polish Teachers is the only professional organization in Poland which has the right, and is legally obliged, to act in an advisory capacity in connexion with education and educators. Article 47 of the Law of 1956 states: 'For all questions concerning teachers, the competent school authority shall act in agreement with the Union of Polish Teachers'. This provision applies in particular to the in-service training of teachers and the evaluation of their professional work, to their living and working conditions, service relations, salaries, etc.

THE DEVELOPMENT OF SECONDARY EDUCATION

After the three successive partitions of Poland between Russia, Prussia and Austria (1772–95), the Polish Commonwealth ceased to exist and the population found itself without national schools. Conditions were worse in the territories annexed to Prussia and Russia, where the schools were transformed into instruments for the Germanization or Russification of Polish youth. For its part, and particularly after 1892, the Austrian Government followed a relatively liberal policy towards the Poles in matters of education and culture.

After World War I, when Poland regained its independence, the educational system had to be rebuilt from practically nothing and in the face of great difficulties. Not all the population felt the need for education, and the percentage of illiterates was very high, particularly in rural districts. There was a lack both of teachers and of schools. In 1934–35, more than a million children were not attending school. Again, it was general secondary education whose development was, relatively speaking, better, the first establishments for such education having been created in the early years of the twentieth century in the territories occupied by Russia. These were private secondary schools, whose system was fundamentally classical, and which were, moreover, almost inaccessible to young workers and peasants.



In the development of technical education the emphasis was on the opening of elementary trade schools and secondary schools of economics. There was also a large number of

GLOSSARY

licea i technika artystyczne: vocational secondary school of fine and applied art.
licea ogólnokształcące: general secondary school.
licea pedagogigczne: teacher training schools.

complementary schools for young employees in trades, commerce or industry. There were no other types of school. Technical education did not develop on any scale until 1945.

Legal basis

The following are the most important legislative measures taken in connexion with the education of adolescents.

Law of 11 March 1932 on the organization of the educational system. Some provisions of this law, which were no longer applicable to the new social and political system, have been repealed.

Decree of 23 November 1945 on school organization during the period of transition, authorizing the Minister of Education to establish or to permit the establishment of schools and courses not foreseen in the Law of 11 March 1932, or to reduce the duration of education in schools affected by that law.

Decree of 23 March 1956 on compulsory education (see above).

Presidential Decree of 23 June 1951 on the organization of vocational educations.

Decree No. 17 of the Council of Ministers, of 8 January 1957, on the organization of agricultural schools.

Decree of 16 September 1953 on education in the arts.

Decree of 26 October 1950 on agricultural education.

Presidential Decree No. 276, of 18 May 1954, improving the system of training for primary and secondary teachers.

Presidential Decree No. 90, of 23 February 1954, reorganizing secondary industrial and teacher training schools.

Presidential Decree No. 91, of 23 February 1954, reorganizing training courses for teachers in elementary technical schools.

Decision by the Minister of Education, of 17 May 1957, on the organization of examinations for the title of skilled worker in elementary vocational schools.

Law of 2 July 1958 on apprenticeship to a trade, the special training and working conditions of minors, and on the initial in-service training of workers.

Law of 10 September 1956, placing technical and vocational education under the Ministry of Education.

Decision of the Council of Ministers of 20 September 1957, placing vocational schools under the educational supervision of the Minister of Education.

Administration

Questions of educational organization are decided on the basis of various legal enactments (laws passed by the Diet, decrees or ministerial orders passed by the Council of Ministers).

Draft laws and decrees are prepared by the Ministry of Education in consultation with competent specialists and with the ministries and institutions concerned (for example, with the Union of Polish Teachers). These drafts are sometimes publicly discussed in the educational press, examined at congresses and conferences of teachers and educational administrators and studied at meetings between senior staff of the Ministry of Education and representatives of the Union of Polish Teachers and of the Pedagogical Institute.

The Ministry also prepares draft plans for educational development over periods of one or more years; these plans are taken into account in the preparation of the budget. They form one of the elements of the national economic plan, which covers the whole of the country's economic and cultural life. The economic plan and the budget are prepared by all the ministries, in agreement with the Ministry of Finance, this work being co-ordinated by the Economic Council of the Council of Ministers. The proposed national economic plan and budget are submitted by the Council of Ministers for the approval of the Diet.

Syllabuses are drawn up by committees composed of specialists in the various subjects, research workers and prominent teachers. Innovations are tried out in the schools, and comments of teachers are taken into consideration. A department of the Ministry—the Department of Programmes and Educational Methods—is responsible for the co-ordination of this activity as far as general education is concerned.

The curricula for technical schools are prepared in a similar way, under the direction of the Centre of Vocational Programmes and Educational Methods, which is directly responsible to the Minister of Education. This centre works in close collaboration with the bodies and ministries concerned (notably with the economic ministries).

School textbooks are approved by the Ministry of Education. They are evaluated on the basis of criteria established by specialists, teachers' views and school results. Textbooks for use in general schools are published by the State Publishing House for School Textbooks, which is directly controlled by the Ministry of Education and which also supplies teachers with most of their books and teaching material. Textbooks for vocational school pupils and teachers are provided by the State Publishing House for Vocational Education. The publishing house 'Our Bookshop', which is associated with the Union of Polish Teachers, specializes in literature for children and adolescents.

General directives on teaching methods are formulated by the Ministry of Education. Methodological documents, guides and collected aids, which have recently become more numerous, are of use to teachers in this connexion. Teachers may also benefit from advice and directions provided by the directors of the 'methodological centres' which are to be found in the voivodships and districts. These directors are chosen from among the most gifted and experienced teachers. Considerable freedom has for some time been accorded to teachers in the choice of appropriate educational and instructional methods.

Control. The Ministry of Education controls teaching and instruction in kindergartens, general and vocational schools and in special schools and establishments. A comparatively small number of schools remain under the direction of other ministries or institutions—the Central Organization of Agricultural Co-operatives, the Central Office of Labour Co-operatives, the Higher Committee for Physical Culture—but educational control of these establishments is vested in the Minister of Education. The Law of 10 September 1956, placing technical and vocational education under the Ministry of Education, reflected the trend towards a

centralized administration of all branches of vocational and general education.

Of all the schools dependent on the Ministry of Education, only the higher teacher training establishments are under its direct control. The others, whilst applying the directives of the Ministry, are administered and controlled by the People's Councils—in voivodships, districts, towns or quarters—which exercise these functions through their technical bodies (curatoria and inspectorates).

Supervision and inspection. Primary schools are controlled by the school inspectors, who head the inspectorates of education, by their assistants and their staffs.

General secondary and vocational schools are inspected by 'visitors' and by the heads of the services coming under the curator of the educational region. These heads of services are responsible for the activities of schools of a particular type, for example, those of general secondary schools, of schools for workers or of vocational schools (sometimes even for the activities of vocational schools of a particular speciality). Some highly specialized vocational schools are inspected by specialists from the Ministry of Education.

'Visitors' must, under all circumstances, have completed their advanced studies, and must have taught for a longer period than that required for the educational staff of the inspectorates.

Schools may also be inspected by the education committees of the competent People's Councils, although these do not attend classes, nor do they evaluate the work of teachers or make recommendations to them.

Parents' committees do not have the right to supervise school activities. Their task is to help schools to solve educational problems—in particular those arising out of the family situation of pupils. Their assistance takes the form, for example, of help to orphans and needy children, the distribution of additional school meals, the ensuring of satisfactory conditions of hygiene, etc.

Finance. The state budget is, at all levels of the administration, the major source of funds for education. Nevertheless, parents' committees, as well as the committees of guardians organized for some schools by various business or industrial concerns or by institutions, may make voluntary grants of small sums to establishments, in particular for the purchase of school equipment.

The population assists the State in other ways, notably by helping in the construction of school buildings, especially in country districts.

Every secondary school has a budget to cover its needs over the period of a year. Funds from the state budget are deposited in the bank account of the school (usually twice a term). The school principal is authorized to dispose of these funds.

Funds for school buildings and for the furnishing of new buildings constitute what are known as 'centralized investments', and are provided out of the state budget. Funds for the purchase of school equipment and for minor construction work constitute what are known as 'decentralized investments'. These are in principle provided from the state budget, but may be supplemented by voluntary contributions from the population.

The state budget provides the necessary funds for teachers' salaries. Salaries are graded in accordance with the degree and length of service of those concerned, and also the type of establishment in which they teach.

Education is free in all public schools.

Buildings and equipment. Official norms and directives provide for an area of school space of 21 to 38 square metres per pupil in primary schools and 38 to 46 square metres per pupil in secondary schools; classroom area is to be calculated on the basis of 1.25 to 1.45 square metres per pupil.

Provision is made for each school to have a garden permitting practical lessons in biology, and special rooms for chemistry, physics, handicrafts, etc.

Vocational schools should be provided, among other things, with separate workshops for all the subjects taught.

Almost all primary school gymnasiums are 9 metres wide and 18 metres long; secondary school gymnasiums are 11 metres wide and 22 metres long.

In all urban schools, and in the largest village schools there is a kitchen, a dining hall, which also serves as a common room, a library, a medical office and two staff rooms for the school personnel.

School welfare services. The school hygiene and health service is organized in health sections by district and voivodship. Provision is made in all schools for a doctor for every 2,000 children and a nurse for every 1,000. School doctors and nurses work full-time and their working week is of 42 hours. Medical treatment of pupils and teaching staff is not the responsibility of the school doctor; his task is to examine the state of health of pupils, to send them for treatment, and, if necessary, to provide them with medical aid and advice in the case of accidents or sudden illness at school.

Workers in almost every occupation, and pupils, in so far as they are children of workers, have a right to free medical attention, and pay only 30 per cent of the cost of medicaments.

Official norms make provision in boarding schools for one full-time doctor for every 400 pupils. They also make provision for one school or inter-school dentist for every 1,000 children; the dentist has a working week of 36 hours.

TYPES OF SECONDARY EDUCATION

If the term 'secondary education' is taken to mean the education of young people between 12 and 18, then the most widespread form of such education in Poland is that given in the sixth-year and seventh-year classes of primary schools.

After completing their primary studies, pupils may enter one of the following: a general secondary school, an elementary vocational school, a technical school or vocational secondary school, a teacher training school or a training school for kindergarten teachers.

Furthermore, adults and minors who are at work, and who have completed their primary cycle (7 years), may continue their studies, but without interruption of their work, either in a general secondary evening school for

workers or in a general secondary correspondence school, in an elementary vocational school for workers, a technical or vocational secondary school for workers, in an evening course or in a correspondence course for the training of primary school teachers.

Adults who have not completed their primary studies have the opportunity to do so in primary evening schools for workers (a preparatory class and the fifth-, sixth- and seventh-year classes of the primary school).

One of the essential tasks of primary education is to prepare pupils to choose their future studies and occupations. Different measures are employed for this purpose: discussions, collective or individual interviews with pupils or their parents, visits to vocational schools and business or industrial concerns, exhibitions, meetings with workers from different sections of the economy, films and other activities which enable pupils to obtain a better understanding of all types of schools and occupations. To this end, the committees of parents collaborate closely with the teaching staff.

In the same way, special centres for vocational education, which have been established in the large towns, provide assistance to pupils in this field.

On the completion of their studies in a general secondary school, a technical or vocational secondary school or a teacher training school, pupils who have gained their baccalaureate may enrol at university, or in other institutions of higher education providing technical, agricultural, economic, medical, educational or physical training courses.

The secondary school year begins on 1 September and ends between 20 and 25 June. The school year is divided into three terms, and marks are awarded four times during the year. The division of the year into two semesters exists only in education for workers.

The long vacation is of about 70 days (last days of June and the months of July and August); the winter holiday is from 22 December to 6 January, and the spring holiday consists of 7 to 10 days at Easter.

Classes are held every day except Sunday and national holidays, and begin in principle at 8 a.m. The daily number of hours of classes varies according to establishment and class.

Sixth- and seventh-year primary classes

The task of the primary school is to teach the fundamentals of general education. It should, in particular, provide pupils with basic notions concerning the laws and phenomena of nature and social evolution, and should educate them in a spirit of patriotism, internationalism and socialist humanism.

The weekly distribution of hours between the different subjects taught in the final 2 years (sixth and seventh) of primary schools is as follows: Polish language, 6; foreign language, 3; history, 3 (2 or 3 in the seventh year); biology, 2; geography (3 or 2 in the seventh year); mathematics, 6 (4 in the seventh year); physics, 3; chemistry, 2 (seventh year only); drawing, 1; handicrafts, 1; singing, 1; physical education, 3.

In order to move up into the next class, the pupil must have obtained, at the end of the school year, satisfactory marks for all compulsory subjects as well as for conduct. Pupils who have received unsatisfactory marks for one or two compulsory subjects must pass a repeat examination at a later date, which is fixed by the educational council, unless such marks are due to prolonged and justified absence. This type of examination does not exist for seventh-year pupils.

Between 1951 and 1956 promotion examinations were organized in the upper classes of primary schools and in general secondary schools, in order to raise the educational level. These examinations have been abolished on the unanimous advice of teachers and school authorities, as not securing the desired results. Similarly, the final examination in primary schools was abolished some years ago. A primary school leaving certificate awarded to pupils furnishes sufficient proof that they have fulfilled their educational obligations.

Primary school teachers receive training in 5-year teacher training schools, which admit candidates who have completed the primary cycle, or in primary teacher training courses of 2 years, open to candidates possessing the baccalaureate.

General secondary schools

From the point of view of its curriculum, the 4-year secondary school is a continuation of the primary school. The two frequently form a composite general school of 11 years, comprising primary classes from the first to the seventh year and secondary classes from the eighth to the eleventh year.

The general secondary school prepares adolescents for a continuation of their studies in an institution of higher education (of 4, 5 or 6 years) or in a higher vocational school of shorter duration. The secondary school also prepares adolescents for occupations which require a general secondary education and which provide for the acquisition of professional knowledge and skill during employment.

The eighth-year class admits pupils from 13 to 16 who have completed their primary studies, and passed an entrance examination which includes Polish and mathematics and, in schools in which teaching is not provided in Polish, the mother tongue of the pupils.

Recruitment of pupils is facilitated by the extension of the secondary school network into rural regions and by aid which the State accords pupils in the form of scholarships and places in boarding schools.

With the exception of private establishments, almost all secondary schools are co-educational.

The secondary curriculum is uniform, although differentiation is envisaged as the result of studies undertaken some time ago with a view to reforming the educational system. The curriculum of general secondary schools includes 15 compulsory subjects. The weekly allocation of hours for these 15 subjects is given in the following table.

In addition to compulsory subjects, secondary schools may, and do with increasing frequency, organize the study of optional subjects.

These subjects comprise foreign languages, shorthand, mechanical and electrical engineering, agronomy, domestic science, the history of art, music, etc.

BASIC TIME-TABLE FOR GENERAL SECONDARY SCHOOLS
(in hours per week)

Subject	Year			
	8	9	10	11
Polish	5	5	5	5
Russian	3	2–3	3	3
Third modern language or Latin	3	3	3	3
History	3	3	3	3
Study of the Constitution	–	–	–	2
Biology	–	2–3	3	2
Geography	2	3	2	–
Astronomy	–	–	–	1
Mathematics	5	4	4	4
Logic	–	–	–	1
Physics	4	3	3	3
Chemistry	2	2	2	–
Drawing	2	1	–	–
Physical education	3	2	2	2
Pre-military training	–	2	2	2
Total	32	33	32	31

The recently introduced curricula and textbooks are better adapted than their predecessors to the potentialities, needs and interests of pupils. They create the necessary conditions for the application of improved educational methods which encourage pupils to think for themselves.

In secondary education, the principles which govern the classification of pupils and their promotion into higher classes are the same as in primary education, and are defined by a common system of regulations.

Secondary studies end with a written examination in Polish and mathematics and with oral examinations in Polish, mathematics, Polish history, general modern history and one of the following subjects: physics, chemistry, biology, geography, Russian, English, German or Latin. Successful pupils receive a proficiency certificate, possession of which is a requisite for admission to higher education.

Training of secondary school teachers is provided by the higher teacher training school (5 years of study) and by the universities. Except in physics and mathematics, the number of teachers is sufficient and only about 4 per cent of them have not received full training. Teachers must carry out a teaching programme of 22–26 hours per week.

General education for adults

Primary schools for workers. Since the 1957/58 school year, the primary schools for workers have had separate classes for minors (from 16 to 18) and for adults, so that account may be taken of differences in interests and experience between these two categories of pupils, and so that suitable educational methods may be applied to each category.

Primary schools for workers comprise preparatory class and the fifth-, sixth- and seventh-year classes. In principle they apply the same curriculum as that for the ordinary primary school, with the exception of technical and artistic subjects and physical education.

Secondary schools for workers. These provide courses in the evening. Secondary schools for workers admit candidates who have completed primary education and passed the entrance examination. In principle, the curriculum is the same as that for ordinary secondary schools, but in view of the age of the pupils, their occupational duties and their experience, and also because of the reduced hours of teaching, the courses in Polish language, history, mathematics and physics have been shortened, and the curriculum does not include artistic or technical subjects or physical education.

Pupils of the eleventh-year class (the final class in these secondary schools) take a final examination for the award of a diploma equivalent to that awarded in ordinary general secondary schools. Unlike primary and ordinary general secondary schools, general secondary schools for adults hold regular promotion examinations for their pupils in view of the special organization of work in this type of establishment, the less regular attendance of pupils and the reduced hours of teaching.

Secondary correspondence schools. This type of school assists pupils by providing them with study material and by organizing for their benefit lectures, consultations and symposia. The aim of the lectures is to help pupils to arrange in systematic fashion concepts they have acquired at home and to relate what they have already learned to the material presented by the lecturers. Consultations enable pupils to carry out the more difficult exercises under the direction of competent teachers, to clear up doubtful points and to correct any mistakes they may have made.

Technical and vocational schools

Elementary vocational schools. These train skilled workers and craftsmen. Studies are of 3 years' duration and follow on from primary education. The curriculum includes general and vocational subjects, together with a practical introduction to the chosen occupation. Practical training takes place in the school workshops or in factories, under the direction of qualified teachers.

Candidates for elementary vocational schools must pass an entrance examination in the Polish language and mathematics (from the primary curriculum). Candidates for arts and crafts must also pass an examination in freehand drawing. Scholarships are awarded to pupils who have achieved good results and who have a record of good conduct, but who are in material difficulties. Many of the pupils are boarders.

Elementary vocational schools for young workers are of a complementary character; they are intended for minors between the ages of 14 and 18. Pupils have 18 hours of theory each week, these hours being included in their working day. The first-year class is open to candidates already at work, or who will be employed within the coming 6 months. Large business or industrial concerns also maintain schools of this type for their employees.

The occupations for which elementary vocational schools provide training are grouped as follows: the building trades (first-year classes have a uniform curriculum; specialization in the different crafts of this category—reinforced concrete, carpentry, roofing, plumbing, painting, masonry, etc.—begins only in the second year); chemistry; woodwork (cabinet making, joinery) and basket work; electrical

engineering, photography and cinematography; mining; telecommunications; mechanical engineering (tinsmithing, milling, precision engineering, fitting, welding, lathe work, agricultural mechanics, watchmaking, automobile mechanics, etc.); minerals (pottery, laboratory glass-blowing, optical glass polishing, etc.); textiles; tertiary sector (hairdressing, hotel and restaurant trades); navigation; business (salesmanship, shorthand and typing); domestic activities.

The following table shows, as an example, the distribution of weekly hours between the different subjects in the curriculum of an elementary vocational school for electrical fitters.

TIME-TABLE OF ELEMENTARY VOCATIONAL SCHOOL
(Electrical fitters)
(in hours per week)

Physical education	2	2	2
Total	36	38	39

Pupils who have completed their studies in an elementary vocational trade school, in one of the sections featured on the list of trades, sit for an examination for the award of the skilled worker's diploma, which is thus additional to their school leaving certificate. They may then continue their studies in a technical secondary school.

There are also elementary vocational schools for pupils who have completed their general secondary studies and who are not employed. Courses last for one year. These schools train for the following occupations: fitter in the chemical industry, chemical assistant, laboratory glass-blower, salesman. It is planned to extend this type of school to the graphic arts, radio-technics and other specialized occupations.

After graduating from an elementary vocational school, pupils must carry out a preliminary period of work and training in a business or industrial concern, before taking up their occupations as qualified workers.

Technical secondary schools. The majority of these are open to pupils who have completed their primary studies. Technical secondary schools coming under the Ministry of Education are divided, according to speciality, into the following groups: chemistry; metallurgy; wood and paper; transport (road, rail and river); electricity; photography and cinematography; surveying; telecommunications, radio and television; geology; mineralogy; graphic industries (typography, chemigraphy, offset, photographic reproduction, etc.); mechanical engineering (metal machining, machine building, thermal energy, refrigeration, etc.); leather; textiles; foodstuffs; navigation; domestic activities; economics.

The Ministry of Agriculture runs 5-year technical secondary schools open to pupils who have completed their primary studies; instruction is given in the following specialities: agriculture, horticulture, agricultural machinery, irrigation, and agricultural book-keeping.

TIME-TABLE OF TECHNICAL SECONDARY SCHOOL
(Speciality: electricity)
(in hours per week)

The Ministry of Forests and the Wood Industry runs technical schools of forestry, which are attended by workers from the state forests, and also technical schools of the forest industries, which train their pupils for work in the mechanical woodwork industry. Courses in these schools last 5 years.

Young people who are not employed in production may be admitted to these schools if they have completed the 7 years of primary school, are between the ages of 14 and 16 and have passed an entrance examination in Polish and mathematics. To be admitted to a technical school directed by the Ministry of Agriculture, they must also have passed an examination in biology, chemistry and physics, based on the primary school syllabus. In the technical schools of forestry, the examination, which is also compulsory, is in history and biology and, in the technical schools of the forest industries, in history, chemistry and physics.

Technical schools have a final qualifying examination; successful candidates obtain the title of technician, and may proceed to advanced studies. On completion of their studies, pupils who go into production must carry out a preliminary period of work. Those of them who have completed their industrial studies are temporarily employed as workers. After this preliminary stage, they may occupy the post of technician. The period of practice lasts in principle several months, and from 1 to 2 years in some specialities.

Most technical schools accept boarders. Pupils are accommodated on payment of a fee.

In technical schools admitting former pupils of general secondary schools, courses are of 2, 2½ or 3 years' duration, according to speciality. These schools organize courses in different specialities which are grouped as follows: chemistry, electrical energy, mining, metallurgy, transport, postal services, mechanical engineering, minerals, the graphic industries, foodstuffs, navigation, the hotel industry and domestic arts, and commerce.

Vocational schools for workers. These comprise 5-year technical schools (ordinary and evening schools) open to pupils who have completed the primary cycle; 5-year technical schools (ordinary and evening schools) open to pupils who have continued their studies up to and including the ninth-year class of general secondary school; 2, 2½ or 3-year technical schools (ordinary and evening schools) open to pupils who have completed the general secondary cycle; 1-year schools for foremen (ordinary schools) open to pupils who have completed the primary cycle and who have 4 or 5 years of practical experience.

Various selection procedures are applied for the recruitment of pupils for vocational schools for workers, e.g., a request for references from employers, the organization of psycho-technical examinations in specialized vocational centres. Candidates may enter any class in a section of these schools, with the exception of the final class. They may enter one of the higher classes if they have passed an examination in all the subjects taught in any of the classes below, and if they have acquired practical experience in a sector corresponding to the speciality of the school. (This practical experience is not required of former pupils in elementary vocational schools.)

Technical evening schools are designed for candidates above the age of 16, who are employed in an occupation corresponding to one of the specialities of these schools. Their courses are of 5 years' duration (10 terms).

In addition to the vocational and technical schools open to candidates who have completed the primary cycle, there are technical schools for workers who have completed their studies in an elementary vocational school. These schools, which train foremen for small-scale industries give instruction for the building, clothing, metal-working, woodwork and leather trades. To be admitted to one of these schools, candidates must present the skilled worker's diploma, and must pass an examination in Polish, mathematics and drawing, of the same standard as that required of pupils who have completed their studies in a corresponding elementary school. Courses in technical schools for workers who have studied in a general secondary school last from 2 to 3 years. Classes are at present being conducted for certain specialities in the groups of electric power, building and commerce. There are also technical correspondence schools for workers who have attended a general secondary school.

Members of the teaching staff of these various vocational schools must have completed a full programme of advanced training in their chosen speciality. Teachers in the professions (engineers, economists) must follow teacher training courses which are organized for them. Teacher training courses are also to be organized in the near future in the polytechnical schools, for engineers who wish to become teachers.

Secondary schools of medical training. These schools, which come under the Ministry of Health, are classed as vocational secondary schools. They comprise schools for the specialized training of nurses, midwives, medical and pharmaceutical assistants, physiotherapists, dieticians, etc. Candidates must have completed their studies in a general secondary school or equivalent establishment, and must have passed an entrance examination (in chemistry or physics or biology, or in subjects related to the chosen speciality).

Teacher training establishments

Teacher training schools. Studies last 5 years. These establishments are open to candidates between the ages of 13 and 16 who have completed the primary cycle (7 years) and who are successful in a written and oral entrance examination in Polish and mathematics. Candidates must also pass a medical examination. Their hearing, too, is tested.

Various forms of state aid—free places in boarding establishments, scholarships etc.—play an important part in the recruitment and selection of candidates. The curriculum includes general education (the same programme as in general secondary schools), pedagogical subjects and special subjects (drawing, handicrafts, singing, music and physical education). Studies are terminated by an examination with written papers in Polish and mathematics, and oral examinations in Polish, mathematics, pedagogics, psychology, elementary teaching methods and one of the following subjects: history, physics, biology, geography or Russian language. Successful students receive a certificate qualifying them to teach in primary schools.

Schools for kindergarten assistants. In general, the principles of recruitment and selection are the same as for training schools for primary teachers. During the first 3 years, the curriculum is the same as that of the latter, but in the fourth- and fifth-year classes, teaching methods for primary schools and teaching methods for special subjects are replaced by eurhythmics and pre-primary teaching methods. The latter form the subject of an oral examination as a part of the qualifying examination.

Teacher training courses. These courses, which are of 2 years' duration, train primary school teachers in one of the subjects of the primary curriculum. There are also an infant education section, which trains kindergarten assistants and primary school mistresses for the younger classes (first to fourth year), and a section which trains the necessary staff for child welfare establishments and primary teachers specialized in singing, handicrafts, biology or physical education. Candidates for teacher training courses should have the qualifying certificate of a general secondary school or a teacher training school, and must pass an entrance examination in the subject in which they are to specialize. Their hearing is also tested, together with their ability to draw.

The 2 years of study are divided into 4 semesters. After passing all examinations, and having taken part in the symposia included in the programme and completed the requisite periods of teaching experience, which are compulsory on completion of their studies, students must prepare a thesis on a given subject, and must pass the examination for the diploma.

These post-secondary training courses provide better training for future teachers than the teacher training schools at secondary level. For this reason they will in a few years' time become the main method of training primary school teachers; teacher training schools are gradually losing their paramount role in the system of teacher training.

Since the school year 1958/59, separate groups (one year of study) reserved for the in-service training of teachers and educators have been set up alongside teacher training courses. Teachers admitted to these groups receive one year's leave with pay.

There are also teacher training correspondence courses which enable in-service teachers to improve their professional knowledge. These courses, which last 3 years, have the same curriculum as the ordinary teacher training courses. Students take part in educational seminars during two sessions: in winter (9 days) and in summer (30 days).

Teachers for training courses for primary school teachers are chosen from the most distinguished secondary school teachers, noted for their wide experience, their interest in the science and methods of teaching and for research work. Authors of textbooks and research workers in higher education may also take part in these courses as instructors.

Vocational teacher training schools. These schools, in which studies are of 4 years' duration, forming a sequel to the elementary vocational school cycle, train teachers for special subjects in vocational schools. Their curriculum includes pedagogical subjects as well as general and vocational subjects. Candidates must pass an entrance examination in Polish and mathematics and a practical examination in their chosen speciality. They must also have had at least one year of practice in this speciality; where this is lacking, they must carry out this year of practice at the end of their studies and before they begin to teach.

Other specialized schools

Schools for training in the arts, which come under the Ministry of Culture and Arts, are divided into primary schools (schools of music) and secondary schools (schools of music, plastic arts and techniques, theatre schools and schools of dancing). Higher schools of art (music, the plastic arts and the theatre) are also dependent on this ministry, as are secondary schools for librarians and schools for culture and education (which provide trained staff for cultural centres, etc.). Some of these schools, such as the primary schools of music and the various specialized secondary schools, provide general as well as special education; the others provide only special training.

Out-of-class activities

Independent class committees, composed of pupils, are organized in secondary schools. Their task is to introduce pupils to team work, to develop their activity and independence and to instil in them a sense of discipline.

The role of these committees, in classes from the first to the fourth year, consists mainly in organizing teams of pupils responsible for classroom order, the preparation of class material, co-operation in the organization of outings, the decoration of classrooms, etc. The committees also initiate activities in the field of hygiene and economy, cultural and artistic activities.

Besides these committees, schools have co-operatives of pupils, Polish Red Cross groups and other school groups of an educational character. The Polish Union of Scouts organizes attractive forms of activity (discussions, games, outings, camps, jamborees, etc.).

The Union of Socialist Youth and the Union of Peasant Youth are political organizations whose activities extend to secondary schools. The first acts through 'activities groups', the second through school groups made up mostly of children of peasant origin.

Various out-of-school activities are also organized in general secondary schools and in vocational schools. These activities are optional, and take the form of competitions, exhibitions, discussions, collective outings, games, dance evenings, sporting events, etc.; they may also take the form of permanent clubs for pupils sharing the same interests—clubs of botanists, bee-keepers, rabbit breeders, model aircraft and ship builders, photographers, or art, dramatic, literary and musical clubs, etc.

One particularly interesting form of inter-school activity is constituted by the 'olympiads' in mathematics, physics and chemistry. These olympiads are organized at the national level and enjoy great popularity among young people. They provide the occasion for the discovery of numerous talents in fields of all kinds. In this connexion, full credit must be given to the Polish Mathematics Society which, since 1949, has organized annual olympiads in mathematics.

TRENDS AND PROBLEMS

For some time now there has been lively discussion in Poland about school reform. Teachers, research workers and educational administrators have been taking part, along with active members of educational and social organizations.

All are of the opinion that under the present conditions of rapid cultural and technical development, which makes ever heavier demands on workers of all categories, the general education provided by the 7-year primary school is not sufficient. At the same time, this school, which pupils leave in principle at the age of 14, does not meet the case of young people who do not continue their studies in a secondary or vocational school and who are too young to start work.

Work and studies undertaken with a view to reforming the school system have been concentrated on three major solutions, namely: the extension of primary education either to 8 or 9 years, or the organization of compulsory general education lasting 10 years. Another solution, which would extend secondary education by one year, has also been considered.

Bearing in mind the large increase in the number of primary school pupils and the difficulties in the matter of capital investment and the recruitment of the necessary teachers, the Ministry of Education tends to favour an 8-year primary cycle. This plan may be implemented in the last stage of the 5-year plan for 1961–65.

Further, the work of extending the compulsory complementary education of minors who do not attend secondary schools and who are not employed will soon be completed. According to present provisions, this obligation concerns only minors who are employed in a business or industrial concern, and is aimed at preparing them for an occupation or at submitting them to a period of preliminary practice.

The Ministry of Education is already organizing 2-year vocational schools: beginning with the 1959/60 school year, minors who have completed their primary studies will be obliged to attend such schools to improve their theoretical knowledge and to receive a practical introduction to the main elements of productive work. The role of these schools is to prepare minors for work or to induce them to continue their education in the concerns in which they are employed. Minors who have not completed their primary studies by the age of 16 will be obliged to continue their education up to the age of 18 under the above programme.

One of the most difficult of present educational tasks—in primary education in particular—is to ensure that all children of school age have the possibility of attending school. Owing to the big rise in the birth-rate in post-war years the number of primary school pupils is constantly increasing. In 1960, children between 7 and 13 will increase in number by 1,282,500 (38 per cent) over the 1955 figure. In the period 1960–65, the number of young people between 14 and 17 will have increased by 910,000 (53 per cent). This increase in the number of pupils calls for more teachers. So, too, large sums will have to be set aside for school investment, all the more because the present situation is already unsatisfactory in this respect (in the majority of urban primary schools, classes take place by rotation).

To meet the most urgent needs in school buildings, 45,000 classrooms will be built between 1958 and 1965; 27,000 of these are to be built between 1960 and 1965 financed by state funds, and about 15,000 financed by social organizations. In celebration of Poland's millenary, the population is making gifts towards the construction of schools and providing voluntary labour on building sites.

Revision of the secondary school curricula is one of the Ministry's most urgent and important tasks. Work to this effect aims at establishing a closer relationship between the school and modern life, particularly by laying greater stress on technology. Changes introduced will enable schools to provide young people with a better preparation for life in the modern world, the main feature of which is the rapid advance of technology, to furnish these young people with the indispensable technical and technological concepts, to inculcate in them the habit of physical work and the corresponding skills and acquaint them with the principal processes of industrial and commercial production. In the curriculum of general secondary education, greater importance will in future be given to handicrafts and drawing. Radical changes will be introduced in the mathematics and natural science syllabuses. In consequence, pupils will not only learn to understand the main laws and phenomena, they will also be introduced to the application of these laws in daily life and in the field of technology.

The planned changes in the curricula will not however restrict the role, importance and scope of general education.

Efforts must be continued to raise the professional level of teachers by improving their training facilities and their means of adding to their knowledge. The Ministry of Education, in collaboration with the Union of Polish Teachers, is striving to raise the status of teachers and to improve their working and living conditions. The Law of 1956 on the rights and obligations of teachers, the 1958 increase in teachers' salaries, and the reduction in the number of teaching hours required of each teacher, represent the first stages along this road.

STATISTICS

Population (mid-year 1958 estimate): 28,783,000.
Area: 120,359 square miles; 311,730 square kilometres.
Population density: 239 per square mile; 92 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58 total enrolment at all educational institutions from kindergarten to university level numbered about 5.2 million, representing 18 per cent of the total population. There were, in addition, some 209,000 people, including 65,000 women, attending adult education courses of a general or practical nature.

Of the school-going population, 8 per cent were in kindergartens, nearly 77 per cent in primary schools, under 4 per cent in general secondary schools, 6 per cent in vocational schools, about 1.5 per cent in all teacher training colleges and 3 per cent at universities and higher educational institutions. The remainder, less than 1 per cent, were pupils in special institutions for handicapped children. Girls made up just under half the enrolment at primary schools, 60 per cent at general secondary schools, 37 per cent at vocational courses, 81 per cent at secondary teacher training schools and 45 per cent at higher teacher training colleges. At universities and other higher educational institutions, women were about one-third of total enrolment.

The teaching staff at all levels, excluding adult education, numbered nearly 200,000 in 1957/58, an increase of about 23 per cent over 1953/54. Details of the proportion of women teachers are not available except for higher teacher training and universities in which women represented about a quarter of the total staff in 1957/58. The average pupil-teacher ratio in primary schools was unchanged compared with 1953/54 at about 33 but in general secondary schools the ratio was 17 compared with 20 at the beginning of the period under review. Compared with 1953/54, enrolment had increased by 27 per cent at primary schools and by 4 per cent in general secondary schools. There was, however, a marked decline in enrolment in technical and vocational schools by about 23 per cent over the 5-year period. In teacher training schools and in university institutions the peak enrolment was in 1955/56 or 1956/57, although in both cases enrolment in 1957/58 was higher than in 1953/54. (See Table 1.)

Enrolment trends in secondary education, 1932–57. Table 2 gives enrolment figures in secondary education for pre-war and post-war periods which are not comparable in coverage. In the 8 years preceding 1939, general secondary enrolment in pre-war Poland increased steadily but did not do much more than keep pace with the rising population. The general secondary enrolment ratio moved from 5 to 6 over this period. From 1945 to 1954, all sectors of secondary education made considerable progress, though enrolment in vocational schools declined sharply from a peak of over half-a-million students in 1951. During the period 1950–54, the ratio of secondary enrolment to the estimated age group 15–19 years old was 27. This ratio was unchanged in the succeeding 3 years 1955–57. (See Table 2.)

Examination results in secondary education, 1953–57. The number of certificates awarded in general secondary education showed little change over this period. Diplomas of vocational and technical schools, however, declined sharply in many cases between 1953 and 1957; this trend is in accordance with the declining enrolment in these schools in recent years. According to the figures in Table 4, some 84,687 certificates were awarded in all sectors of secondary education in 1957/58 as compared with 142,588 corresponding certificates in 1953/54.

Educational finance, 1957. Total expenditure on education in 1957 (fiscal year beginning January) was 12,782 million złotys, averaging about 452 złotys per inhabitant. Of this sum, 12 per cent was for capital expenditure. (See Table 3.)

1. Excluding certificates awarded in workers' vocational schools.

2. State schools only.

PORTUGAL

THE EDUCATIONAL SYSTEM

The following articles of the Constitution of the Portuguese Republic (1933) relate to education.

'Education and instruction shall be obligatory, and are the concern of the family in co-operation with public or private institutions.' (Article 42.)

'The State shall officially maintain primary, complementary, secondary and higher schools, and institutions of advanced education.

'Elementary primary education is obligatory and may be given at home or in private or state schools.

'The development, teaching and propagation of the arts and sciences shall be fostered and protected, subject to respect for the Constitution, the authorities and the co-ordinating activity of the State.

'The aim of state education is not merely the development of physique and of the intellectual faculties, but the training of character, adequate preparation for a profession, and the inculcation of all moral and civic virtues, in accordance with Portugal's traditional principles of Christian doctrine and ethics.

'No authorization shall be required for the teaching of religion in private schools.' (Article 43.)

'Private schools corresponding to the state schools may be established freely. They shall however be subject to state inspection, and may be subsidized by the State or authorized to grant diplomas if their teaching staff and curricula are of a standard not lower than those of the corresponding public institutions.' (Article 44.)

The structure of the Portuguese school system is shown in the diagram on page 977.

THE DEVELOPMENT OF SECONDARY EDUCATION

Secondary education is governed by Decree-Law No. 36507 of 17 September 1947 and by Decree No. 36508 of the same date, which lay down the regulations for this type of education. Experience showed, however, that the curricula prescribed by this reform were somewhat too heavy, and could be abridged without detriment to the pupils' training or knowledge; another decree embodying this modification was therefore promulgated on 12 October 1948.

Administration

Within the Ministry of Education there is a technical and advisory body—the National Education Board (Junta Nacional de Educação)—which is divided into specialized sections, the third section dealing with pedagogical questions relating to secondary education. Headed by the General Director of Secondary Education, this section comprises several state teachers, a private school teacher, the

inspector-general of private schools and a representative of the education department of the Ministry for Overseas Provinces.

It deals with (a) evaluation and choice of school textbooks; (b) equivalence of certificates gained in schools other than the Portuguese *liceus* (in Portugal or in other countries) with the certificates awarded by the Portuguese *liceus;* rules for the conduct of *liceus;* and (c) selection of private school teachers.

The authority of the central directorate of education is exercised in each *liceu* through the school director. He is chosen by the Ministry of Education from regular teachers on the general list, and is appointed for an indefinite period. The administrative staff of a *liceu* also includes a deputy director and a secretary; they, too, are chosen by the Minister from regular teachers belonging to the establishment. The director—or, in his absence, the deputy director—is responsible for the execution of regulations and the decisions of the authorities. Secondary education is divided into three cycles, and the teaching staff for each of these cycles receives instructions from a 'cycle director'.

The director of a *liceu* is assisted by two boards: an educational board and a disciplinary board. The functions of the first of these are essentially pedagogical, and it consists of all the teachers on the school staff and the doctor or doctors attached to the school. It meets at the beginning of the school year and also whenever convened by the director. The disciplinary board holds an ordinary meeting once a month and extraordinary meetings when convened by the director. The members include the director, the deputy-director, the secretary, the 'cycle directors', the doctors attached to the school and the teachers responsible for religious instruction and moral education.

Inspection. Inspection of secondary schools is carried out by a special department—the Inspecção de Ensino Liceal—whose duties are to determine the educational value of teaching equipment and textbooks, to give advice on the arrangement of the courses and on school time-tables, to assess and mark the teachers' work, to set examinations and to prepare educational statistics.

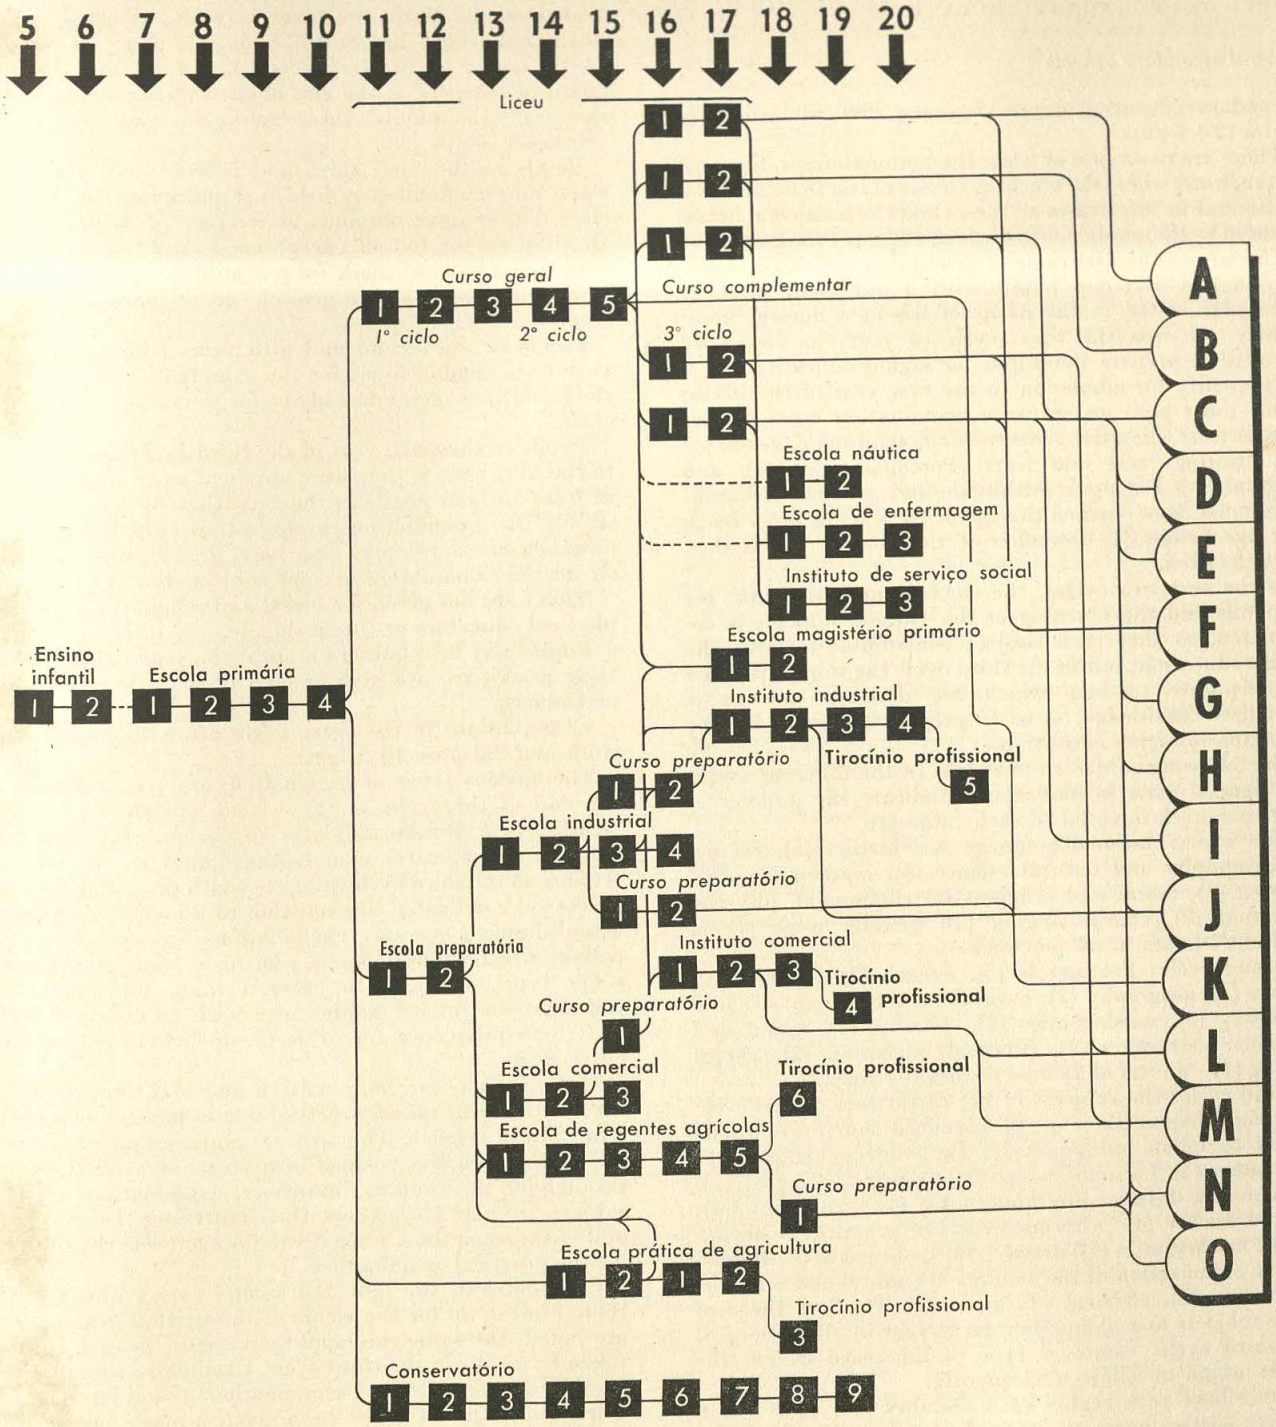
Finance. All public educational expenditure is borne by the State. The public education budget is drawn up by the Minister of Education, sanctioned by the Finance Minister and approved by the Cabinet.

The State bears the cost of building and maintaining *liceus.* Until 1928, the *liceus* themselves had to make all the improvements and additions needed; in return, they received from the State half the total school fees and examination fees and the whole of the school attendance grants. Since 1928 (Decree No. 15942), all money received by the *liceus* is handed over to the State and administered by a commission called Junta de Construcçoes para o Ensino Técnico e Secundário, which comes under the Ministry of Public Works.

Liceus are autonomous and are controlled by an administrative board, the chairman of which is the deputy-director. The other members include a 'cycle director' and the head of the secretariat, who is also the treasurer.

In Portugal, primary education alone is free of charge. At the higher levels a fee is charged, but the cost of schooling is not high. The State provides assistance for secondary school pupils in the form of exemptions from fees and scholarships; 10 per cent of the boarders in each school may be granted exemptions.

Fifty scholarships, each worth 3,000 escudos, are awarded annually to deserving pupils in the second and third cycles who are in poor circumstances. To qualify for a scholarship, pupils must have received an average mark of at least 16 out of 20 either for their year's work or at the promotion examination. Pupils who gain scholarships are exempted from paying fees.



The Minister of Education may also award money prizes (*prémios nacionais*) to boarders in *liceus* who have obtained at least 18 marks out of 20 at the final examinations and whose behaviour has been exemplary throughout the year.

GLOSSARY

conservatório: vocational secondary school of fine arts or music.
ensino infantil: pre-primary education.
ensino técnico profissional: vocational education.
escola comercial: vocational secondary school of commerce with possibility of entry after second year into a preparatory class (*curso preparatorio*) leading to further specialized vocational training.
escola de enfermagem: vocational training school of nursing.
escolado magistério primário: teacher training school for primary school teachers.
escola industrial: vocational secondary school of technical studies.
escola náutica: vocational training school for careers at sea.
escola prática de agricultura: vocational training school of agriculture.
escola preparatória: lower vocational secondary school.
escola primária: primary school.
escola de regentes agrícolas: vocational training school for agricultural overseers.
instituto comercial: upper vocational secondary school of commerce.
instituto industrial: upper vocational secondary school of technical studies.
instituto de serviço social: vocational training school for social workers.
liceu: general secondary school with 7-year course in three cycles, the first two, of 2 and 3 years duration, providing a general course (*curso geral*), the last 2 years being specialized (*curso complementar*) and preparatory to university education.
tirocínio profissional: upper vocational course in agriculture.

UNIVERSITY FACULTIES OR COLLEGES

A. *Letras:* arts (five departments).
B. *Direito:* law.
C. *Medecina:* medicine.
D. *Farmácia:* pharmacy.
E. *Ciências:* science (four departments).
F. *Educação física:* college of physical education.
G. *Militar:* military college.
H. *Naval:* naval college.
I. *Arquitectura:* college of architecture.
J. *Instituto superior técnico:* college of technology.
K. *Belas-artes:* college of fine arts.
L. *Ciências económicas e finanças:* college of economics and finance.
M. *Ultramar:* college for overseas administration.
N. *Agronomia:* college of agriculture.
O. *Veterinária:* college of veterinary science.

TYPES OF SECONDARY EDUCATION

General secondary schools

Secondary education covers 7 years, divided into three cycles (2+3+2).

There are two types of *liceu:* the national *liceus*, financed by the State, where the teaching covers at least the first two cycles and in most cases all three; and the municipal *liceus*, financed by the municipalities, which offer only the first cycle.

The aim of the first cycle (2 years) and the second cycle (3 years) is to equip pupils with a minimum stock of knowledge suited to the needs of life in a modern community, whereas the third cycle (2 years) is especially intended to prepare the pupils for higher education.

To qualify for admission to the first year of the *liceus*, pupils must pass an entrance examination consisting of written tests (dictation, composition, arithmetic, geometry and drawing) and oral tests (Portuguese, history and geography of Portugal, arithmetic and geometry). Candidates must have reached the age of 10 years or must reach that age before 31 December of the year in which they enter the *liceu*.

In the first two cycles, the curriculum is the same for all pupils and the teaching of the various subjects is co-ordinated, so that each subject contributes towards the pupil's education; but in the third cycle the work is divided into separate sections which are designed to impart specialized knowledge, so as to prepare the pupil for the transition to higher education.

The following subjects are taught in the different cycles (the figures given in parentheses indicate the number of hours per week devoted to each subject):

First cycle: national language and history (5), French (5), geography and natural science (4), mathematics (3), drawing (3), moral and religious instruction (2), physical education (2), choral singing (2), manual work (1)—a total of 27 hours' work per week.

Second cycle: Portuguese (3), French (2), English (5), history (3), geography (2), natural science (2), physics and chemistry (3), mathematics (3), drawing (1), moral and religious instruction (1), physical education (2), choral singing (1)—a total of 28 hours' work per week.

Third cycle: the subjects in the curriculum of this cycle vary according to the type of advanced course the pupils intend to follow subsequently. The subjects taught are: Portuguese (4), Latin (5), Greek (3), French (3), English (3), German (5), history (4), philosophy (4), geography (4), natural science (4) (with one period of practical work per week), mathematics (4), drawing (4), political and administrative organization of the country (1), moral and religious instruction (1), physical education (2). The last three of these subjects and philosophy are taught in all sections of the third cycle, whatever type of advanced course the pupils intend to follow subsequently.

The school year begins on 1 October and ends on 10 August. Classes begin on 1 October and end on 30 June; there are three terms—1 October to 23 December; 3 January to the Friday before Palm Sunday; the Wednesday after Easter Sunday to 30 June.

Classes are of 50 minutes' duration, with a 10 minutes' interval.

Examinations. Marks are given in each subject according to the following scheme: 0–4, bad; 5–9, poor; 10–13, fair; 14–17, good; 18–20, very good. Marks are given by the board of teachers at the end of each term. At the end of the year, the pupils' three marks in each subject are averaged.

Pupils in the first, third and fourth years (the years when no examination is held) are promoted to the next class if they have obtained an average of at least 10 for all subjects (or for all except one). Any pupil who has been given a 'bad' mark for one subject must repeat the year, unless he has been given a 'good' mark for another subject.

Pupils in the second and fifth years (the examination years) are eligible to sit for the examination if they fulfil the conditions mentioned above for promotion to the next class.

Pupils in the sixth year of the third cycle are promoted to the next class if they have obtained an average mark of at least 10, and pupils in the seventh year are eligible to sit for the examination in subjects in which they have obtained the same mark. They may, therefore, be eligible to sit for the examination in some subjects but not in others.

Marks are not given for moral and religious instruction, physical education or choral singing.

Pupils may be required to repeat the year either because their marks are not high enough or because of irregular attendance.

Examinations in the *liceus* begin after the end of class work and finish on 10 August.

The various types of examination are: examinations at the end of the cycle, in the second and the fifth years, entitling successful candidates to the general secondary education certificate; examinations held in the various sections of the third cycle, in the seventh year, and entitling successful candidates to admission to a higher educational establishment; entrance examinations for secondary education, which qualify pupils who have been taking some other type of course to enter a *liceu;* and individual examinations for candidates who wish to obtain a certificate of equivalence for subjects which were not on their curriculum.

Examinations are both written and oral, and pupils in the seventh year take a practical test in physics, chemistry and natural science. The written examination papers are set by the secondary school inspectors, and are the same throughout the country; moreover, examinations in each subject are held throughout the country on the same day and at the same time. Each *liceu*, however, sets the subjects for the practical examinations.

Candidates in the first and second cycles who get less than 9 out of 20 for the whole of the written examination are failed; the same rule applies in regard to each subject taken by pupils in the third cycle. Candidates who pass are eligible to take the oral examination. Candidates in the third cycle who have not been given a mark below 16 in any subject and candidates in the first and second cycles whose average mark is not less than 14 are exempted from the oral examinations. Candidates who fail in the written examinations may appeal against the jury's decisions to the third section of the National Education Board, which may alter the mark given by the jury.

Teaching staff. Teachers in a *liceu* may be either permanent, engaged under contract, assistant teachers or temporary teachers. Teachers in the first three of these categories must hold the state teacher's certificate; it is optional for temporary teachers. Teachers who hold this certificate are known as *agregados*.

Teachers are required to work for 22, 20 or 18 hours per week, depending on whether they have been in the teaching service for less than 10 years, between 10 and 20 years or more than 20 years. This number of teaching hours may be reduced in the case of teachers who have special duties in the *liceu*.

Registered teachers must hold a university degree in the subjects they are to teach, and must have passed examinations in the following subjects: pedagogics and didactics, history of education, school organization and administration, general psychology, educational psychology, psychological testing and school hygiene. They then sit for an examination designed to ascertain whether they possess the knowledge necessary to carry out the duties they will be undertaking, after which they do a 2-year period of practical teaching under the direction of teachers who are specialists in teaching methods, in a teacher training *liceu* at Lisbon, Oporto or Coimbra.

After the 2-year practical teaching period, they sit for an examination, known as the State Examination, and if successful gain a certificate which is the equivalent of the *agrégation* certificate awarded by French universities.

Vocational and technical schools

Vocational and technical education is imparted in (a) training schools for farm managers, practical agricultural schools, agricultural apprenticeship schools and elementary agricultural schools; (b) industrial schools and institutes; and (c) commercial schools and institutes.

This type of education is intended both for young people who have never been engaged in industry or commerce and for those already in employment who have completed only their compulsory primary education.

Vocational education: preparatory cycle. Pupils may sit for the entrance examination for the preparatory cycle after they have taken the examination at the end of the fourth year of primary education, or during that year. It comprises 2 years' work, and is common to industrial, commercial and agricultural education. It is primarily a period for observation and direction finding, and is intended to give pupils a course of training which will enable them to proceed to one of the three types of education mentioned above, and which will also bring to light their special abilities and aptitudes.

At the conclusion of the preparatory cycle, pupils enter the vocational training courses, where they receive training in the work they have chosen.

Agricultural education

Farm management training schools. These schools are open to pupils who have completed the 2 years of the preparatory cycle of the vocational course or the 2 years of the first cycle of a *liceu*. The entrance examination is a test in French. The course is of 5 years' duration, and at its conclusion pupils do a period of at least 6 months' practical work, at the end of which the final examination is held. Successful candidates obtain the farm manager's certificate (*regente agrícola*).

Practical agricultural schools. These schools are open to pupils who have completed the course of study required for admission to the farm management training schools or the preparatory course at a practical agricultural school. The course is of 2 years' duration, and at its conclusion pupils undertake a period of at least 6 months' practical training, after which they take the final examination; successful candidates obtain the skilled farm worker's certificate (*agente rural*).

Industrial education

Industrial schools. Pupils enter these schools after completing the preparatory cycle of vocational education. The courses are usually of 3 years' duration (some are 4-year courses). Industrial schools are intended for pupils who wish to learn a trade.

Pupils may then take a specialized course lasting 1 or 2 years, according to the trade they have selected. The course is followed by at least 6 months' practical work in the trade concerned. Pupils who have completed this period of practical work and whose marks are satisfactory may take the trade proficiency examination, and, if successful, they are awarded the proficiency certificate.

In some schools there are 'preparatory sections', where pupils who intend to continue their studies in the industrial institutes receive the necessary training. These sections correspond to the second part of the last year at an industrial school, and applicants for admission must have obtained an average mark of at least 12 in the previous year in the subjects regarded as essential for the career they have chosen.

Industrial institutes. These institutes are open to candidates who have attained the age of 15 and have passed an entrance examination. The examination differs in type according to whether the candidates have completed the preparatory section of an industrial institute, the preparatory cycle for vocational education or a vocational course. At the conclusion of a 4 years' course, followed by a practical training period of at least 6 months, pupils may become assistant engineers (*auxiliares de engenharia*) or industrial specialists (*chefes de indústria*); after 2 years' studies, they may enter a higher engineering school.

Commercial education

Commercial schools. Pupils enter these schools after completing the preparatory cycle; the course is of 3 years' duration. After the last year of the course, pupils may carry out a period of practical work, which is optional in most cases, but sometimes compulsory. These schools provide training for commercial workers.

As in some industrial schools, there may be 'preparatory sections', which, in that case, replace the last year of the course and ensure the necessary training for

pupils who wish to continue their studies in commercial institutes.

Commercial institutes. The instruction provided in these institutes is of the same standard as that given in industrial institutes. The course is of 3 years' duration. These institutes train administration assistants, accountants, customs experts or foreign language correspondents. They also offer a 2-year course for candidates for admission to the Higher Institute of Economic and Financial Science or the Faculty of Economic Science.

Vocational education for persons already in employment

Complementary courses for apprentices. These courses (*cursos complementares de aprendizagem*) are open to candidates who have successfully completed the fourth year of the primary school course and who are at least 13 years of age on 1 October. In addition to attending classes, pupils receive practical training in their work in workshops, factories, offices, business houses, etc. These courses are of 3–5 years' duration, according to the subject studied. They are designed to give apprentices general and technical training which, together with the experience they have gained apart from the school, will enable them to acquire the desired proficiency in their trade.

Advanced training courses. These courses (*cursos de mestrança*) are open to candidates who have successfully completed the fourth year of the primary school course and who have reached the age of 14 on 1 October. Classes are usually held in the evening, and the curriculum is similar to that followed in the complementary courses for apprentices or in vocational training schools. In the latter case, the curriculum includes subjects taught in the preparatory cycle of industrial or commercial schools. According to the law, advanced training courses must be held to enable workers with sufficient ability to obtain the general and technical training necessary for them to become foremen or to be in charge of a workshop. The classes are held in the evening, and pupils remain in employment, except in the case of industries where the distance to be covered makes it impossible for pupils to combine attendance at the school with their work. In that case, full-time courses may be arranged. The courses are open to workers who have gained an industrial certificate in the trade concerned and who have had at least 3 years' practical experience in their trade as skilled workers or in a similar position; workers who have had at least 8 years' practical experience in the trade in which they wish to take a course and who have successfully completed the fourth year of the primary school course, may also enroll provided they pass an entrance examination.

Rural workers may also attend complementary courses for agricultural apprentices and elementary agricultural courses. The structure of these courses is different from that of the courses offered in farm management training schools or practical agricultural schools. The courses for agricultural apprentices are of a special type and are designed to give young people of both sexes who have successfully completed the fourth year of the primary school course, and who are already engaged in agricultural or similar work, general and technical training which will enable them to do their work more efficiently. Elementary agricultural courses are intended to increase the proficiency of adult agricultural workers who have attained a reasonable standard of general education, to encourage them to undertake specialized studies, and to stimulate activities which will contribute to the welfare of rural families by the intensive application of modern cultivation techniques or working methods and the dissemination of the scientific knowledge required for this type of work.

These courses do not lead to a certificate or a diploma.

Teacher training schools

Primary school teachers are trained at teacher training schools, which are all of the same type, and are called *escolas de magistério primario.*

Before being admitted to the entrance examination for a primary teacher training school, candidates must have completed at least the second cycle of the secondary school course or the equivalent.

The curriculum in primary teacher training schools includes the following subjects: general pedagogics and theory of education; educational psychology; methods of teaching the various subjects; school hygiene, physical education; drawing and educational handwork; education of girls; music and choral singing; school legislation and administration; moral and civic education; practical teaching.

At the end of the third half-year, pupils take a final examination on all the subjects studied. Successful candidates are eligible to undergo training for a 6-months period in a primary school. At the end of this training period, they take a state examination to test their teaching ability. They are required to prepare the plan for a lesson for one of the four primary classes and to give a lesson in accordance with this plan in a primary school; this is followed by discussion of their lesson-plan.

Staff for teacher training schools is recruited, according to subject, from qualified primary and secondary school teachers and school doctors. For physical education, music and choral singing, teachers are chosen who teach these subjects either in *liceus* in the district where the primary teacher training schools are situated or at the National Physical Education Institute. Instruction in school hygiene is given by a school doctor.

Art education (secondary level)

The National Conservatory is divided into two sections—music and theatre. The first of these covers vocal and instrumental music and composition. The theatre section includes courses in diction, dramatic art, choreography and stage-craft, which are intended to train actors, dancers, scene painters and stage designers. As well as these technical courses, pupils must also take courses in general subjects such as Portuguese language and literature, French, Italian, acoustics, the history of music and the history of the theatre. In the music section, both day-pupils and boarders are accepted; in the theatre section, free evening courses are arranged. Music is also taught in a number of private schools.

Out-of-class activities

There is a youth movement, the Mocidade Portuguesa, to which all young Portuguese between 7 and 18 may belong, whether they are still at school or not. It aims at all-round development of personality, in its physical, moral and civic aspects.

The movement arranges various activities for boys, according to age-group—educational games, choral singing and open-air activities for boys between 7 and 10, sports (sailing, riding, swimming, athletics, model aeroplane building, gliding, flying, etc.), and cultural activities (literary competitions, plays, journalism, music and singing, visits to museums and art galleries, etc.) for boys between 10 and 18. The movement also maintains canteens, youth hostels, students' hostels and holiday camps, and organizes work competitions, international work camps (archaeology, forestry, civic construction), etc.

The movement's principal object in its work with girls is to help to prepare them for family and social life. Activities arranged for girls include games and sports, camping, gymnastics, swimming, riding, nursing and child care, cooking, cutting and sewing, household crafts, music, the plastic arts, regional dances and other aspects of national folklore, literary discussion groups, educational excursions, cultural meetings, etc. In many cases regional conditions and the legitimate tastes and desires of the girls are taken into account in arranging these activities. There are other activities for girls; for example, a 'Mothers' week' is held annually, during which cradles and layettes are presented to poor families, Christmas and Easter campaigns are organized, when clothing and other commodities are distributed to the poor and the sick, and art education groups and holiday camps, etc., are organized. The movement also provides scholarships for girls in poor circumstances and maintains school canteens and students' hostels, etc.

In its work for both boys and girls, the movement collaborates closely with the schools and with the children's families.

STATISTICS

Population (mid-year 1958 estimate): 8,981,000.
Area: 35,599 square miles; 92,200 square kilometres.
Population density: 252 per square mile; 97 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, total pupil enrolment (not including some 100,000 in adult education courses) was over 1 million, being 12 per cent of the total population. Of this number, 83 per cent were enrolled in kindergartens and primary schools, 9 per cent in general secondary schools, 7 per cent in vocational schools, 0.3 per cent in teacher training schools and 2 per cent in institutions of higher education. The proportion of girls was 47 per cent in primary education, 45 per cent in general secondary education, 28 per cent in vocational education, 86 per cent in teacher training schools, and 27 per cent in higher education. Women teachers represented 90 per cent of the teaching staff in primary education, 46 per cent in general secondary education, and nearly one-third in vocational education.

Between 1953 and 1957, total enrolment increased by about 12 per cent, though the increase in primary education was only 7 per cent. Enrolment in general secondary education had grown by 38 per cent and in all the vocational schools together by about 50 per cent. The pupil-teacher ratio in public primary schools dropped from about 40 in 1953 to about 36 in 1957. (See Table 3.)

Enrolment trends in secondary education, 1930–57. Table 1 shows that enrolment in general secondary education, except for a setback in 1940 and 1941, had increased continuously since 1930. Taking into account minor differences in coverage, it may be said that there was a quadrupling of enrolment in these schools over a period of 28 years. Vocational school enrolment increased more than two and a half times between 1930 and 1946. Though there seems to have been some decrease after the high level reached in 1946, the trend has been definitely upward again since 1950. Enrolment in teacher training schools was irregular between 1930 and 1941, hence it has not been included in computing average total enrolment for that period. Nevertheless, the number of pupils preparing to become teachers had at least doubled between 1930 and 1957. For the period 1942–44, an average total enrolment

of 88,000 represented about 12 per cent of the estimated population 15–19 years old. By 1955–57, the average enrolment had increased much faster than the population, hence the enrolment ratio shows an increase of 50 per cent over that of 1942–44.

Examination results in secondary education, 1953–57. Between 1953 and 1957 the number of general secondary school certificates granted had increased by 42 per cent. The increase was more than twofold in the case of certificates for the completion of the third cycle. The number of girls receiving certificates of the first and second cycles remained at about 50 per cent, but the proportion of girls receiving the third cycle certificate dropped from 58 per cent in 1953 to only 34 per cent in 1957.

In vocational education, 85 per cent of the diplomas for medical and social services were received by girls, while in all the other branches of vocational education together, the proportion was only one-third. There were no girls among recipients of certificates from agricultural and nautical schools. In 1957, girls received 88 per cent of all teacher training school certificates. The total number of such certificates increased by 35 per cent between 1953 and 1957. (See Table 2.)

Educational finance, 1959. In the state budget for the fiscal year beginning in January 1959, a sum of 901,686,245 escudos was allocated to the Ministry of National Education, and in addition the Ministry of Public Works allocated a sum of 212,160,000 escudos for the construction of school buildings. Thus total expenditure for education, recurring and capital, may be estimated at 1,114 million escudos, or an average of 120 escudos per inhabitant. (Official exchange rate: 100 escudos = 3.46 U.S. dollars.) Detailed distribution of this expenditure is not available, but it is known that the state budget included the following provisions: for primary education, 419,495,360 escudos; secondary education, 94,017,604; vocational education, 142,745,628; higher education, 160,404,808.

3. Teachers in secondary schools of fine arts are included with those of colleges of fine arts.
4. Not including schools of fine arts.
5. Not including theological courses, courses of nursing and social services, nor private courses of fine arts.
6. Not including students enrolled in courses of nursing and social services or private courses of fine arts.
7. Not including students enrolled in courses of nursing and social services, or in public and private courses and colleges of fine arts.

THE EDUCATIONAL SYSTEM

The main provisions concerning education, teaching, scientific research and culture in the Overseas Provinces are laid down in Section IV of Chapter VIII of Law No. 2066 of 27 June 1953 (*Lei orgânica do Ultramar Português*). This provides for the operation of schools by the State, and authorizes the establishment of private schools corresponding to the official schools. Private schools are subject to the control of the State, which may subsidize them and make them official.

The same law also stipulates that the budget of each Overseas Province must provide for the award of scholarships to enable pupils to attend teaching institutions in Portugal or in other provinces, if such institutions do not yet exist in its own territory. When an aptitude examination is required for admission to schools of a type not found in a particular province, the tests may be taken in that province.

The fundamental provisions governing educational and cultural activities overseas and the operation of organizations relating thereto are contained in Decree-Law No. 41472, of 23 December 1957.

The school system in the Portuguese Overseas Provinces forms part of the general pattern of Portuguese education. It is consequently the same as in metropolitan territory, but not all the levels and types of education provided in Portugal are to be found overseas.

General secondary and vocational secondary education are a continuation of the instruction given in primary schools, so that pupils attending schools at this level are generally within the 10–18 age group. In view of the special needs of the overseas population, older pupils are sometimes admitted, provided that school discipline is not impaired thereby.

The State grants wide facilities (study grants and scholarships, paid journeys, opportunities for taking entrance examinations in overseas territories) to students wishing to take post-secondary courses which are not available in the province where they have done their secondary studies.

DEVELOPMENT OF SECONDARY EDUCATION

General secondary and vocational education in Portuguese Overseas Provinces has developed along the same lines as in Portugal itself. Teaching has not been provided nor have courses been instituted simultaneously in the various provinces, but only as their usefulness became recognized, and depending on the interest shown in them by the inhabitants. However, as soon as secondary educational institutions were founded, they automatically came under the laws and statutes in force in Portugal; these laws and statutes were then adapted to the needs of the area.

Legal basis

The main laws now governing secondary education in Overseas Territories are the following:

Decree-Law No. 36507 of 17 September 1947 (*Reforma do Ensino Liceal*).

Decree No. 36508 of 17 September 1947 (*Estatuto do Ensino Liceal*).

Legislative Decree No. 12101 of 4 November 1947 (*Aplicada ao Ultramar o Decreto-Lei No. 36507*).

Legislative Decree No. 12238 of 9 January 1948 (*Adaptação do Decreto No. 36508 ao Ultramar*).

Law No. 2025 of 19 June 1947 (*Promulga a reforma do ensino técnico profissional*).

Legislative Decree No. 13883 of 15 March 1952 (*Aplica, com alterações, ao ultramar a Lei No. 2025*).

Decree-Law No. 37028 of 25 August 1948 (*Reforma do ensino técnico profissional*).

Decree No. 37029 of 25 August 1948 (*Estatuto do ensino técnico profissional*).

Legislative Decree No. 13884 of 15 March 1952 (*Adaptação do Decreto-Lei No. 37028 ao Ultramar*).

Legislative Decree No. 13885 of 15 March 1952 (*Adaptação do Decreto No. 37029 ao Ultramar*).

Decree-Law No. 40799 of 13 October 1956 (*Ensino agricola*).

Some of these laws were subsequently amended without, however, affecting their general structure. In each Overseas Province, in conformity with the above-mentioned laws, legislative decrees (*portarias*) concerning subjects of purely regional interest have been published by the local administration.

Secondary education is not compulsory.

Administration

The fundamental provisions relating to the organization of secondary education (reforms, regulations, statutes, etc.) are prepared at the Ministry of Education. They are applied to Overseas Provinces through ministerial decrees issued by the Ministry for Overseas Provinces. In this Ministry, educational affairs are the responsibility of the Directorate-General of Education. The Ministry also assists, when it deems necessary, the governors and the legislative councils of Overseas Provinces and other local bodies.

The curricula and school textbooks are generally the same as in Portugal; but in order to sanction their use overseas, a *portaria* or a decree from the Ministry for Overseas Provinces must be published. Provisions governing the administration and inspection of general education in Overseas Provinces are contained in Decree-Law No. 41472 of 23 December 1957.

Control. Each secondary institution is under a rector (in *liceus*) or director (in vocational schools) whose hierarchical and administrative superior is the director or head of

the provincial education services. These services submit all questions lying outside their competence to the office of the governor. Important problems to be considered or solved at the Ministry for Overseas Provinces are referred by the provincial governor to the Secretariat of State.

For the study and evaluation of the administrative problems of educational institutions, the directors of the provincial education services and the rectors and directors of general secondary and vocational schools are assisted by bodies whose purpose is to give advice and to collaborate in the management of these institutions (*Conselho Técnico Pedagogico, Comissão Central de Patronato do Ensino Técnico Profissional, Conselhos Escolares, Conselhos Disciplinares, Comissões de Patronato das Escolas Técnicas*, etc.).

Inspection. The inspectors of overseas education are directly subordinate to the Ministry for Overseas Provinces; their functions are essentially of a pedagogic and cultural nature and are not generally concerned with administrative matters. The main responsibilities of inspectors are: (a) to observe the operation of schools and verify the application of laws and regulations; (b) to report on the capacities of the teaching staff; (c) to take the initiative in arranging for the further training of teachers; (d) to collect data for an appraisal of the efficiency of each school; and (e) to ascertain whether or not private schools meet all the indispensable teaching requirements.

In agreement with the Minister of Education, the Ministry for Overseas Provinces sends inspectors of the Ministry of Education to the various territories to assess the work and advise teachers.

Finance. Official schools are financed by the State, which determines annually, for each Overseas Province, the budget to cover the costs of school staff, equipment and services. Each school has its own regulations, which are applied by its head and its administrative board.

Schools are built, and generally a part of the furniture and equipment supplied, at state expense through the directorate of public works of the province.

The State also supports many non-official schools, in particular those of the Portuguese Catholic missions. These grants, included in the general provincial budget, are, as a rule, in the form of a lump sum and are administered by the institutions which receive them. Other private schools have their own funds and handle them independently.

All official schools admit free of charge pupils whose study record is satisfactory, but whose parents do not have sufficient means.

Besides this privilege, parents residing far from the school attended by their children may receive a monthly educational allowance from the State if their income and financial resources do not exceed the limits stipulated by the law of their respective province.

Buildings and equipment. Geographical and local conditions vary greatly in the Overseas Provinces, and school building and equipment problems are therefore studied on the spot by specialists of the public works, education and school health services.

School welfare services. Secondary schools have medical services under the supervision of the Departments of School Health and Physical Education. The health services may also provide, when necessary, special staff and equipment (X-ray examinations, malaria tests, etc.). In the principal Overseas Provinces, there are vocational guidance offices which collaborate with the schools.

TYPES OF SECONDARY EDUCATION

On completion of primary school, pupils who wish to continue their studies may choose between general secondary and vocational education. The latter type is divided into three branches: industrial, commercial and agricultural.

There are no regular school guidance services, but rather vocational guidance offices; in provinces where they exist, they can give valuable help about the choice of courses. The law also provides that, at the end of the second year of secondary education, pupils may transfer directly, without losing a year, from general secondary to vocational schools or vice versa.

On completion of secondary education, pupils may take intermediate courses in industrial or commercial institutions, training courses for primary teachers or university courses, or else they may go to special schools (see the diagram of the Portuguese school system, page 977).

The school year comprises the same number of days as in Portugal, but is not distributed in the same way in all provinces owing to differences of climate. Christmas and Easter holidays are observed in every province and the school year is divided into three terms; the duration of each term, the schedule of class hours, the beginning and end of the school year, etc., are determined in each province by the local legislative body.

General secondary schools

The official general secondary schools are the *liceus*. Private institutions providing this form of education are required to observe all the rules of teaching laid down in the regulations governing official schools.

The curricula and internal organization are the same as in Portuguese schools and need not again be described here (see the corresponding section of the chapter on Portugal).

The syllabuses for the various subjects are provided in Decree No. 39807 of 7 September 1954 as applied in overseas territories by the Legislative Decree No. 15108 of 10 November 1954. In accordance with this decree, history courses must include special lessons on events which have occurred in the various Overseas Provinces, and other courses relate to elements and subjects of interest that can be provided by the local region.

Secondary school teachers are trained in the same way throughout Portuguese territory. In addition to a university diploma (*licenciatura*), a good background of general culture and teaching experience are required of candidates for teaching posts. Teaching experience is acquired in a teacher training school over a period of 2 years, after which there is a state examination. In place of a university degree,

teachers of physical education, choral singing and women's work are required to have taken special courses.

Teachers for established posts (*professores*) are normally recruited through a competitive written examination open to those who already hold a state diploma. The competitive examinations are held at the Ministry for Overseas Provinces, and successful candidates are placed on the official list of teachers for overseas secondary schools, and may be sent to any province.

In addition to holders of established posts, temporary teachers who have not taken the state examination may be engaged when the shortage of teachers in a school so requires. Temporary teachers are recruited for the school year in each Overseas Province.

Vocational and technical schools

The official vocational and technical secondary institutions are industrial and commercial schools. Private establishments which provide this training are required to observe all teaching rules contained in regulations governing the official schools.

The curricula and internal organization are essentially the same as for the corresponding types of school in Portugal. The curricula for vocational, industrial and commercial training are given in the Legislative Decree No. 13800 of 12 January 1952 and have been applied in Overseas Provinces by Legislative Decree No. 13887 of 15 March 1952. This decree stipulates that special courses must deal with historical events which have occurred in the various Overseas Provinces; other courses should relate to various elements and subjects of interest that can be provided by the local region; local conditions must be taken into consideration in the exercise of the profession.

Teachers for technical schools are trained in the same way throughout Portuguese territory. In addition to a university diploma, general culture and teaching experience are required. The latter can be acquired during a 2-year probationary period followed by a state examination. The recruitment of teachers (*professores*) is carried out by the same methods as those described above for teachers in *liceus*. Instructors (*mestres*), assistant instructors (*contramestres*) and other staff on the practical side are recruited by means of competitive examinations held in Overseas Provinces.

In addition to permanent teachers, temporary teachers who have not taken the state examination may be employed when there is a shortage of teaching staff. Temporary teachers are recruited for the school year in each province.

Agricultural education at secondary level is now provided in the Province of Angola. In order to adapt the courses to local circumstances and climate, it has been necessary to promulgate special legislation establishing certain standards and giving local legislative authorities broader powers in connexion with this type of education (Decree-Law No. 40799 of 13 October 1956).

The curricula for vocational secondary schools of agriculture has been approved by Legislative Decree No. 14524 and adapted to Overseas Provinces by Legislative Decree No. 16128 of 8 January 1957.

Teacher training schools

There is a teacher training school (*escola normal*) at Goa, which trains teachers for local primary schools; otherwise all teacher training takes place in Portugal.

Out-of-class activities

Most out-of-class activities are conducted by the national youth organization, Mocidade Portuguesa; it maintains a centre of activity in each school, with good-fellowship sections, cultural sections (theatre, films, concerts, libraries, radio, chess, philately, newspapers, etc.), sports sections and others.

TRENDS AND PROBLEMS

There has been a remarkable development of secondary education in Portuguese Overseas Provinces during the last few years; not only have school facilities expanded, but new courses have been provided in existing schools. Moreover, many private institutions have been granted official status.

Practically all large urban centres have either general secondary or industrial and commercial schools, or both.

Agricultural education is shortly to be provided in Mozambique.

[*Text prepared by the Ministry for Overseas Provinces, Lisbon, in July 1960.*]

STATISTICS: ANGOLA

Population (mid-year 1958 estimate): 4,508,000.
Area: 481,352 square miles; 1,246,700 square kilometres.
Population density: 9 per square mile; 4 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, total enrolment was 91,000, or 2 per cent of the total population. Girls made up 29 per cent of the pupils in primary education, 49 per cent in the general secondary schools, and 28 per cent in the vocational schools. The average number of pupils per teacher was 40 in primary schools, and 26 in the secondary schools. Between 1953 and 1957 pupil enrolment increased by more than 60 per cent, but the number of teachers increased by only 39 per cent, from 1,924 in 1953 to 2,667 in 1957. It should be noted that there were 6 school years during this period, owing to a change which was made in order to bring the school year in Angola into conformity with metropolitan Portugal. (See Table 1.)

Enrolment trends in secondary education, 1930–57. From Table 2 it may be seen that general secondary education was relatively underdeveloped up to 1947; since then enrolment has increased at a rapid pace (between 5 and 10 per cent each year). Vocational education, after fluctuating in enrolment between 1932 and 1952, has been steadily growing since 1953. Average total enrolment and the enrolment ratio have shown rapid increase since the period 1945–49.

Examination results in secondary education, 1954–55. In 1954, 61 general secondary school certificates were awarded, of which 32 to girls. In 1955, the number of successful candidates increased to 151, and included 51 girls. Primary teacher training school certificates were granted to 43 boys in 1954 and 21 boys in 1955.

Educational finance, 1957. For the year 1957, recurring expenditure on education amounted to 43,959,000 escudos, an average of 10 escudos per inhabitant. Official exchange rate: 100 escudos = 3.46 U.S. dollars.

STATISTICS: CAPE VERDE ISLANDS

Population (mid-year 1958 estimate): 192,000.
Area: 1,557 square miles; 4,033 square kilometres.
Population density: 123 per square mile; 48 per square kilometre.

Summary of school statistics, 1953–57. In 1957, total enrolment was 11,550, representing 6 per cent of the total population. Nearly 90 per cent of all pupils were enrolled in primary schools. The average number of pupils per teacher was 46 in primary schools, 25 in general secondary schools and 34 in vocational schools. Between 1953 and 1957 there was an overall increase of 42 per cent in pupil enrolment. (See Table 1.)

Enrolment trends in secondary education, 1930–57. Between 1930 and 1947, enrolment fluctuated between 200 and 400 without any discernible trend. Steady increase is shown since 1949, the number of pupils having almost tripled between 1949 and 1957. Together with vocational schools, the average total enrolment for the period 1955–57 represented not quite 6 per cent of the estimated population 15–19 years old. (See Table 2.)

Educational finance, 1957. For the year 1957, recurring expenditure on education amounted to 4,547,000 escudos, an average of about 25 escudos per inhabitant. Official exchange rate: 100 escudos = 3.46 U.S. dollars.

1. General education only.

STATISTICS: MACAO

Population (mid-year 1958 estimate): 210,000.
Area: 6 square miles; 16 square kilometres.
Population density: 35,000 per square mile; 13,125 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, total enrolment was 36,451, representing about 18 per cent of the total population; some 97 per cent of these pupils were in private schools. The percentage distribution of enrolment by level and type of education was as follows: pre-primary, 15; primary, 66; secondary general, 12; vocational, 7. The proportion of girls was 43 per cent in primary and general secondary schools, taken together, and 29 per cent in the vocational schools. Between 1953 and 1957 total enrolment increased by 67 per cent. (See Table 1.)

Enrolment trends in secondary education, 1930–57. Table 2 presents figures for 1930–32 and 1937–39 which exclude private secondary schools; these schools are included after 1940. Between 1941 and 1946, there was a serious decline in general secondary school enrolment, owing to circumstances unrelated to the school system. This trend was reversed after 1946, yet the number of pupils in 1957 was still only two-thirds as high as in 1941. In vocational education, the growth of enrolment has been rapid and continuous since 1930. For the latest period 1955–57, the average total in secondary and vocational schools was equal to about 30 per cent of the estimated population 15–19 years old.

Educational finance, 1957. For the year 1957, recurring expenditure for education amounted to 2,289,000 escudos, an average of 11 escudos per inhabitant. Official exchange rate: 100 escudos = 3.46 U.S. dollars.

1. From 1930 to 1939, not including private schools.

STATISTICS: MOZAMBIQUE

Population (mid-year 1958 estimate): 6,234,000.
Area: 302,329 square miles; 783,030 square kilometres.
Population density: 21 per square mile; 8 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, total enrolment was 371,324, or 6 per cent of the total population. Of these pupils, 97 per cent were enrolled in primary schools. The proportion of girls, for 1956, was 36 per cent in primary schools, 43 per cent in public secondary schools, and 34 per cent in vocational schools. Apparently no girls were enrolled in teacher training schools, although about 15 per cent of the primary school teachers were women. The average number of pupils per teacher in primary schools has been around 100 or more but in 1957 was only 16 in secondary schools, and 25 in vocational and teacher training schools. Between 1953 and 1957, there was an increase of 82 per cent in primary school enrolment (mostly in the mission schools, which account for 94 per cent of all primary school pupils), an increase of 19 per cent in vocational schools, and of 62 per cent in the teacher training schools. (See Table 1.)

Enrolment trends in secondary education, 1930–57. In the public secondary schools, pupil enrolment increased nearly ninefold between 1930 and 1957, and the proportion of girls increased from 26 per cent in 1930 to 43 per cent in 1956. The development of vocational education has been somewhat uneven during this entire period, but shows an increasing trend on the whole. The average total enrolment in the three types of secondary education—general, vocational and teacher training—but not including the private secondary schools, was slightly over 2 per cent of the population 15–19 years old for the period since 1950. (See Table 2.)

Examination results in secondary education, 1953–57. In 1957, the number of certificates granted for completion of secondary school (*liceu*) was 998, of which 423 were received by girls. In 1953, the number of certificates granted was 415, of which 170 were received by girls. Thus the increase between 1953 and 1957 was about two and a half times, both in the total number of certificates and in the number received by girls. The annual numbers of teacher training certificates (all received by boys) were as follows: 1953, 36; 1954, 20; 1955, 66; 1956, 67; 1957, 75. Information concerning the completion of various vocational courses is incomplete, but for 1957, a total of 325 pupils (of whom 122 girls) passed their final examinations in five of the commercial, industrial and technical schools.

Educational finance, 1957. For the year 1957, recurring expenditure on education amounted to 54,080,000 escudos, an average of about 9 escudos per inhabitant. Official exchange rate: 100 escudos = 3.46 U.S. dollars.

1. Public schools only.

2. General and vocational only.

STATISTICS: PORTUGUESE GUINEA

Population (mid-year 1958 estimate): 559,000.
Area: 13,948 square miles; 36,125 square kilometres.
Population density: 40 per square mile; 15 per square kilometre.

Summary of school statistics, 1953–57. In 1957, total enrolment was 11,541, representing 2.1 per cent of the total population. Of these pupils, 97 per cent were enrolled in primary schools. The pupil-teacher ratio was 62 in primary schools and 17 in the secondary schools. Between 1954 and 1957 enrolment increased by 64 per cent in primary schools and by 50 per cent in general and vocational secondary schools. (See table.)

Enrolment trends in secondary education, 1950–57. From 1950 to 1957 the number of pupils in the one private general secondary school increased from 46 to 239, while enrolment in the vocational schools over the same period increased from 67 to 160. When related to the estimated population 15–19 years old, the average total secondary enrolment gives a ratio of less than 1 per cent.

Educational finance, 1957. For the year 1957, recurring expenditure on education amounted to 1,340,000 escudos, an average of 2.4 escudos per inhabitant. Official exchange rate: 100 escudos = 3.46 U.S. dollars.

1. Not including rural mission schools.

STATISTICS: PORTUGUESE INDIA

Population (mid-year 1958 estimate): 649,000.
Area: 1,619 square miles; 4,194 square kilometres.
Population density: 401 per square mile; 155 per square kilometre.

Summary of school statistics, 1943–57. In 1957/58, enrolment in all schools except primary and secondary schools for the foreign population and private vocational schools was reported at 27,393 pupils. On the basis of figures for 1954/55 it may be assumed that the 1957/58 enrolment in the schools not accounted for was around 25,000. Total enrolment in 1957/58 may therefore be estimated at about 8 per cent of the total population. Of the reported enrolment 92 per cent was in primary education. The proportion of girls was 44 per cent in primary schools, 31 per cent in general secondary schools, 23 per cent in vocational schools and 33 per cent in higher education (including teacher training). Women teachers were 55 per cent of the teaching staff in primary schools and 17 per cent in secondary schools. Average number of pupils per teacher was 27 in the primary schools and 22 in the secondary schools.

Between 1953 and 1957, total enrolment increased by 38 per cent in primary schools and by 20 per cent in all types of secondary schools, general and vocational. (See Table 2.)

Enrolment trends in secondary education, 1948–57. In these 10 years, enrolment in general secondary schools more than doubled. There was a sudden drop in vocational school enrolment in 1951, which had not been recovered by 1957. Average total enrolment, and the enrolment ratio, showed an increase of over 60 per cent between the period 1948–49 and the period 1955–57. (See Table 1.)

Examination results in secondary education, 1953–57. In 1953, there were 51 certificates granted for the completion of secondary school, third cycle. Girls received only 5 of these certificates. The total number of such certificates awarded in 1957 rose to 110, of which 25 were received by girls. The number of certificates granted for the second cycle of secondary school increased from 121 (of which 25 to girls) in 1953 to 148 (of which 39 to girls) in 1955.

Educational finance, 1958. In the fiscal year beginning in January 1958, the state budget allocated 19.5 million escudos for education, averaging about 30 escudos per inhabitant. Recurring expenditure was 89 per cent of this total. It was distributed by level and type of education as shown in Table 3B.

STATISTICS: SÃO TOMÉ AND PRINCIPE

Population (mid-year 1958 estimate): 62,000.
Area: 372 square miles; 964 square kilometres.
Population density: 167 per square mile; 64 per square kilometre.

Summary of school statistics, 1953–57. In 1957, pupil enrolment in 20 primary and 2 secondary schools reached a total of 4,000, representing about 6 per cent of the total population. The proportion of girls was 31 per cent in primary schools and 41 per cent in secondary schools. Of all pupils 94 per cent were in the primary schools, where the average pupil-teacher ratio was 74; in the secondary schools, there were only 11 pupils per teacher. Between 1953 and 1957, there was a 23 per cent increase in total enrolment, but the number of girls going to school increased by 44 per cent. (See Table 2.)

Educational finance, 1957. In the fiscal year beginning in January 1957, total expenditure for education amounted to 1,879,383 escudos, averaging 30 escudos per inhabitant. Of this amount, 93 per cent was recurring expenditure (including 87 per cent for salaries, and 1.4 per cent for central administration), and 7 per cent was capital expenditure. The amount spent for primary education was 1.3 million escudos, or 72 per cent of the total, while 28 per cent was spent for secondary education. (See Table 1.)

STATISTICS: TIMOR

Population (mid-year 1958 estimate): 490,000.
Area: 5,763 square miles; 14,925 square kilometres.
Population density: 85 per square mile; 33 per square kilometre.

Summary of school statistics, 1953–57. In 1957, the total number of pupils enrolled in primary and secondary schools (not including private schools for the foreign population) was 5,572, which was slightly over 1 per cent of the total population; 27 per cent of these pupils were girls. The average number of pupils per teacher was 36 in primary schools and 13 in the secondary schools. Between 1953 and 1957 there was a decrease of 2 per cent in the total enrolment reported. (See Table 2.)

Educational finance, 1957. For the year 1957, total expenditure for public primary and secondary schools amounted to 1,151,000 escudos, averaging 2.3 escudos per inhabitant. This total amount was distributed as follows: recurring expenditure, 94 per cent (of which 66 per cent for salaries to teachers, and 7 per cent for central administration); capital expenditure (for equipment), 6 per cent. (See Table 1.)

QATAR

THE EDUCATIONAL SYSTEM

There are three levels of education in Qatar: primary, for boys and girls, a 6-year course; preparatory (or intermediate), for boys, a 3-year course; secondary, for boys, a 3-year course.

The Government of Qatar is at present devoting considerable attention to the development of primary education, as a means of abolishing illiteracy and laying the educational foundations of a new society. It seeks to encourage this branch of education by: (a) opening a primary school in every village in which there is a sufficient number of boys and girls of school age to justify it; (b) supplying pupils with textbooks, stationery and all other requisites; (c) providing them with full lunches daily; (d) supplying them with winter and summer clothes; (e) offering them all kinds of medical care; (f) transporting pupils and teachers to and from school in government vehicles; (g) providing board and lodging for all expatriate pupils and pupils whose circumstances prevent their enjoying a stable home life.

All these services are provided free of charge. Moreover, from the fourth primary year upwards pupils receive government bursaries, with graded increments as they are transferred to higher classes.

The primary course lasts 6 school years. The age of admission is normally 6 years but pupils of either sex may be accepted after their fifth birthday if there are vacancies.

The curricula, syllabuses and examination system in primary education are those adopted in the Arab League States under the Cultural Agreement of the League, with such modifications as local circumstances in Qatar render necessary. A pupil is promoted to a higher grade if he passes his examinations in all but two subjects.

Attendance at primary schools is increasing rapidly from year to year. Increasing prosperity is enabling the people of Qatar to dispense with the financial aid that their children used to give them, and their cultural progress helps them to appreciate better the importance of the education of girls. This may help to explain the substantial increase in primary school enrolments in both sexes.

Administration

As the Department of Education cannot supervise the village schools directly because of their remoteness, government supervisors have been appointed in each area outside the capital, and some of the powers of the central administration in matters of administrative inspection and technical supervision of schools and teachers are delegated to these officials. The question is under study of giving such supervisors wider powers in order to derive the full benefit from decentralization.

Central supervision of all schools is in the hands of specialized technical and administrative inspectors, who are under the control of the Director of Education. Thus the schools are systematically inspected with reference to administration, financial affairs, methods of teaching, and school activities. There is also a woman inspector of girls' education, who is directly responsible for inspection and liaison between girls' schools and the Department.

TYPES OF SECONDARY EDUCATION

At the end of the primary course pupils sit a general examination held under the supervision of the Department of Education; the examination subjects are religious knowledge, Arabic, arithmetic, science, social studies, and handicrafts. Successful candidates receive an official diploma known as the Primary School Certificate, which is the basic qualification for continuing their studies.

Secondary education, defined for the purposes of this survey as education from the ages of 11 or 12 to 18 or 19 years, in fact corresponds to two distinct levels in the educational system of Qatar and other Arab countries: a lower secondary level known as preparatory or intermediate education and an upper secondary level or secondary education properly so called.

Preparatory education. Since in the early years of secondary schooling the pupils are not sufficiently mature either physically or mentally to make a satisfactory choice of career or future training, it was decided to create an intermediate level of education following on from the primary, in order to allow time for their personalities to develop. During this stage the pupil and those in charge of him have a better opportunity to discover the type of studies he should pursue at the next level.

In more detail, the objectives of preparatory education are: (a) to ensure that those who leave school at the end of this stage have a fund of knowledge and experience that will be of help to them in practical life; (b) to help discover the pupils' interests and aptitudes and properly develop and direct them; (c) to equip pupils with the knowledge and skills they will need as a basis for theoretical secondary studies.

The subjects taught include religious knowledge, Arabic, English, mathematics, social studies, science, art, physical exercises, and hobbies. Instruction is given by specialized subject teachers who, like the secondary school teachers, are graduates of universities or other institutions of higher education.

The same facilities as were mentioned earlier are provided free of charge to the pupils at this level. Their allowances are increased whenever they pass into a higher grade.

At the end of this stage the pupils take a general examination which is held under the supervision of the Department of Education. They are examined in the subjects listed above (with the exception of physical education

and hobbies). Those who pass receive an official diploma called the Preparatory School Certificate.

Secondary education. The subjects and syllabuses for the first year, like those of the preparatory level, are taken by all pupils and include religious knowledge, Arabic, English, various branches of social studies, science, and mathematics, art, physical training and hobbies. By the time they pass the examination for the second grade, they will have shown in what direction their tastes and abilities lie and will be ready to move on to the science or the arts side.

Not all the subjects on the science side are scientific, nor are all those on the arts side 'arts' subjects, although each stream is predominantly what its name indicates it to be, from the point of view of the type and number of subjects prescribed. Thus pupils on the science side devote comparatively little time to religious instruction, Arabic, and social studies, but have extensive courses in such subjects as chemistry, physics, biology, and the various branches of mathematics. Pupils of the arts side, on the other hand, take brief courses in science subjects and extensive ones in Arabic and English and social studies—geography, history, sociology, psychology, and logic.

This tendency towards specialization helps the pupil to choose the university course that best suits his abilities and gives him a sound preparation for higher study. Furthermore the fact that the syllabuses are framed on principles laid down by the competent committees of the League of Arab States ensures that pupils leaving secondary school will have no difficulty in enrolling in the universities of the Arab States.

At the end of this stage the pupils sit a general examination organized and supervised by the Department of Education which is, naturally, different for arts and science candidates. Successful candidates are awarded a diploma called the Secondary School Certificate.

The Trades and Vocational Training School. This is a technical school at present open to pupils who have passed the examination for entry to the fifth grade of primary school. It is planned to raise the standard of qualification for admission year by year, and in two years' time candidates will have to hold the Primary School Certificate.

The purpose of the school is to remedy the shortage of manpower in some occupations in the developing economy of Qatar by turning out a class of technicians with a reasonable education combined with sufficient manual skill and experience in such trades as motor-car mechanics, carpentry, blacksmithing, electricity, metal-working, lathework and welding, of which the oil company factories and public works are in urgent need.

The school and its curricula are organized with this aim directly in view. It has six main sections, in addition to some sub-sections. At the outset the pupils receive general vocational instruction and then begin to specialize in the fields they are interested in. They study the theoretical side of their trade in class and the practical side in the workshops. They also receive instruction in some general educational subjects which they require at this level, such as religious knowledge, Arabic, English, civics, arithmetic, technology, and technical drawing. Care has been taken to ensure that tuition in the four arts subjects provides exactly what the pupils need, from the standpoint of the type of course and the number of class-hours devoted to it; naturally fewer arts subjects are studied here than by pupils at the preparatory level.

At the end of the school year the pupils take a theoretical and a practical examination. At the end of the 3 years' course, the pupils sit a general examination organized and supervised by the Department of Education. Successful candidates are awarded a diploma called the Industrial Education Certificate.

TRENDS AND PROBLEMS

The main problem is the shortage of native teachers. A simple solution has been to employ nationals of other Arab countries and these teachers have proved a great success. The need for expatriate staff will gradually disappear with the spread of education in Qatar and the opening of teacher training schools for both sexes.

Another problem is the provision of education for the many adults who had no opportunity of attending school or were not educated beyond primary level; this is being tackled by opening primary and secondary evening schools.

[*Text prepared by Mustafa M. al-Dabbagh, Director of Education, Doha, in February 1960.*]

STATISTICS: QATAR

Population (mid-year 1958 estimate): 40,000.
Area: 8,500 square miles; 22,014 square kilometres.
Population density: 5 per square mile; 2 per square kilometre.

Summary of school statistics, 1957. Only very limited data are available. In 1957 there were 16 kindergartens, 3 primary schools and 1 secondary school enrolling approximately 1,550 pupils. A vocational education centre and a school for girls were also opened in 1957 but details are not available.

RUMANIA

THE EDUCATIONAL SYSTEM

The educational policy of the Government is laid down in Article 80 of the Constitution of the Rumanian People's Republic:

'Every citizen has the right to education.

'This right is guaranteed through general, free and compulsory primary education; through the system of state scholarships for deserving students and pupils in higher, secondary and primary educational establishments; and through the organization, in industrial firms, state enterprises, machine and tractor stations and collective farms, of free vocational education for workers.'

Education at all levels is a responsibility of the State, as is also the development of science, literature and arts.

Previous Rumanian constitutions had also proclaimed the right to education, but only those children whose parents were able to pay school fees and to meet the costs of schooling actually enjoyed this right. Consequently, the educational level in Rumania was one of the lowest in Europe, and in 1948 there were more than 4 million illiterates or semi-literates in the country—almost a quarter of the population. The People's Democratic Government ensures that all the material conditions necessary for the enjoyment of the right to education exist.

Education in the People's Republic is governed at every stage by the Education Reform Act of 3 August 1948. Under this Act the State assumed complete charge of education and all private schools were abolished.

All Rumanian citizens, without distinction of nationality, sex, religion or class have the same right to education. The organization and the curricula of the schools are uniform; thus pupils are able to continue their studies in higher schools and pass from one category of school to another. Education is laic, realist and scientific. Instruction is given in the mother tongue of the children. Curricula and textbooks are standard and compulsory for schools of the same type. Free and compulsory education (7 years' schooling) is guaranteed through the existence of a widespread network of day and boarding schools and by the grant of scholarships to pupils.

The structure of Rumanian education is shown in the diagram on page 1005. The various types of school may be categorized as follows: crèches and day nurseries for children not over the age of 3 years; pre-primary establishments (kindergartens and nursery schools) for children between 3 and 6 years; primary schools (elementary)—schools giving a 4-year course (classes I to IV) for children between the ages of 7 and 11 years; schools giving a 7-year course the upper classes of which (V to VIII) form the first cycle of secondary education (children between 11 and 14 years); secondary schools (properly so called)—general secondary schools (classes VIII to XI) for adolescents between 15 and 18 years; vocational and technical schools (courses lasting from 2 to 4 years) for adolescents between 15 and 18 years; teacher training schools; higher educational establishments—universities and institutes.

Role of public authorities

The Ministry of Education and Culture is responsible for the general organization, control and orientation of education. The Department of Higher Education of this Ministry has direct control over all post-secondary institutions. Schools of general education (classes I to XI), teacher training schools, trade schools, agricultural schools and pre-primary schools are organized and administered by the People's Councils (local government authorities). When taking any measures in connexion with education these councils are directed, supervised and guided by the Schools Department of the Ministry of Education and Culture.

Vocational and technical schools are organized and supported by the competent ministries and central authorities. The Ministry of Education and Culture is in charge of the co-ordination of this category of schools and supervises the teaching.

Crèches and day nurseries are organized and administered by the Ministry of Health and Social Welfare.

THE DEVELOPMENT OF SECONDARY EDUCATION

The development of the general secondary school provides a good illustration of the changes that have taken place in the functions and status of the various kinds of secondary schools at different periods in Rumanian history.

This type of school first appeared in Rumania towards the middle of the nineteenth century in the form of the *gimnaziu*. The courses lasted 4 years and the school admitted pupils who had completed primary school. The number of schools of this type was greatly increased, and a higher cycle (the *liceu*) was added to the 4-year course (which thus became the lower cycle). The purpose of this secondary school was to form the elite of the ruling classes and it was the object of the great solicitude of the bourgeois society. The majority of the pupils belonged to the well-to-do classes.

General secondary schools were reorganized on several occasions, always with the purpose of adapting the youth of the country to the needs of the social life of the period. The practical effect of these reforms was to be found in the addition of literary and scientific sections to the classical *liceu*. But whatever its curriculum or title the secondary school of the past was accessible only to a restricted number of children and merely served as a preparation for higher education. The training of the higher ranks qualified to satisfy the demands of the economic, cultural and public life of the country was subject to obtaining the secondary

school leaving certificate. In view of its curriculum and conditions of work the general secondary school had only a limited influence on the cultural life of the country.

The educational reforms of 1948 remedied these faults and laid the foundations for a system of general secondary education in accordance with the cultural interests of the people and the needs of the new society in process of construction in the Rumanian People's Republic—the socialist society.

Technical and vocational education. Before the establishment of the People's Democracy in Rumania, the training of qualified workers was usually a haphazard affair. Most workers in industry, and in agriculture even more, were illiterate or had received only the most rudimentary education. The apprenticeship schools, the vocational schools, the elementary trades schools and commercial schools trained only a very limited number of workers, if the needs of the country's economic structure are considered. These schools were open to children who had completed 4 years of primary school. The courses were short, usually one or two years; they were mainly held in the evening and were of a very low standard. There were some advanced industrial, agricultural and commercial schools which had four lower and four upper classes, but they were very few in number and usually they were concerned only with training the teaching staff required for the various elementary vocational schools. After the 1936 reorganization, these advanced schools were given the name of industrial or commercial secondary schools, although the prospects they offered their pupils were no greater than in the past and successful pupils were given no opportunity to study at a higher establishment. Consequently, the vocational education given in trades schools—the only form of education open to working-class children—was in fact a dead end and blocked any opportunity of further study.

The present system of education for skilled workers and medium grade technicians was established by the Education Reform Act and improved later by decisions of the Council of Ministers in 1955 and 1957.

Administration

The main features of educational administration have been outlined in the section dealing with the educational system as a whole.

The Ministry of Education and Culture, acting through the inspectors-general, each with respect to his particular branch, is responsible for the general supervision and direction of general and technical secondary education. The inspectors-general are recruited from among the more competent teachers with a long period of practical experience. They may inspect the educational establishments of the regional and district People's Councils and the teaching authorities and staff of schools administered by the Ministry of Education and Culture as well as the vocational and technical secondary schools within the jurisdiction of other ministries.

The education departments of the regional and district People's Councils, acting through their own inspectors and specialists in teaching methodology, exercise complete supervision of the secondary schools under the Ministry of Education and Culture. They also supervise the teaching in the schools which come under the other ministries and central authorities, but the technical supervision in these schools is the responsibility of inspectors belonging to the respective ministries and authorities.

Finance. General and vocational secondary education is financed out of the central government, regional, district and local budgets. The sums necessary are assessed on the basis of government scales. The use to which the funds allocated are to be put is defined by legislation. The monies provided by the state budget are used for the payment of teachers' salaries, the construction of school buildings, the purchase of school furniture and equipment, teaching material, etc.

The State grants a large number of scholarships to pupils. Pupils of vocational schools receive free board and a sum equivalent to 50 per cent of the wage allocated for the work they do. At other types of secondary school, there is a high proportion of scholarship holders, viz. 31.4 per cent of the pupils in technical schools and 35.3 per cent of the students at teacher training schools. The number of scholarships granted to pupils in classes V to VII amounts to 19,108.

Education in the 7-year schools is entirely free and only a small number of pupils at other types of secondary school pay any fees, which are in any event very modest. The fees are assessed on the basis of the income of the parents and the pupils' reports.

When the schools are under construction the specifications laid down by the Ministry with respect to space, light, heating, sanitary installations and safety must be adhered to.

Medical treatment is free for pupils and teachers. It is provided by the Ministry of Health and the Ministry of Education and Culture, which supply the necessary funds and have established a network of health centres.

TYPES OF SECONDARY EDUCATION

To guide pupils at 7-year schools and their parents in the choice of a secondary school or occupation, various means are used: manual training classes in classes I to IV; employment in workshops (carpentry, metalwork) and instruction in the rudiments of industrial production in classes V to VII of urban schools; practical work on experimental farms and instruction in the rudiments of agricultural production in classes V to VII of rural schools; and organized visits to undertakings, factories, engineering works, machine and tractor stations, state farms, collective farms, building yards, etc. Six days are set aside annually for such visits.

On the basis of instructions issued by the Ministry of Education and Culture and the vocational and technical guidance office, teachers at the 7-year schools and general secondary schools organize pupils' discussions on the various sectors of the national economy and the characteristics of the different trades and occupations and arrange for conducted visits to factories and establishments of higher education. These visits take place on dates fixed by the factories and schools, usually in spring, and they

continue until the end of the school year. The aim is to give vocational guidance to the pupils. During these visits, the pupils are given a description of the type of activity carried on in the undertakings, their share in the national economy, the training required for the exercise of a particular trade or occupation and the satisfaction to be obtained from such employment; the names and achievements of outstanding workers are published. Parents may accompany their children on such visits. Other methods used are literary meetings, debates on current problems, seminars, meetings with workers and technicians, etc. Participation in productive work, in the two weeks before the end of the school year, also helps the children to decide on their vocational objectives.

The People's Democratic Government is paying special attention to improving the living and working conditions of pupils at general and vocational secondary schools. All vocational, technical and teachers' schools, all art schools and some of the general secondary schools are provided with boarding accommodation and canteens. The material means allocated for secondary education have been considerably increased since the establishment of the People's Democracy. New schools and boarding schools are constantly being constructed. From the date of the first five-year plan, large sums have been set aside for school buildings and equipment.

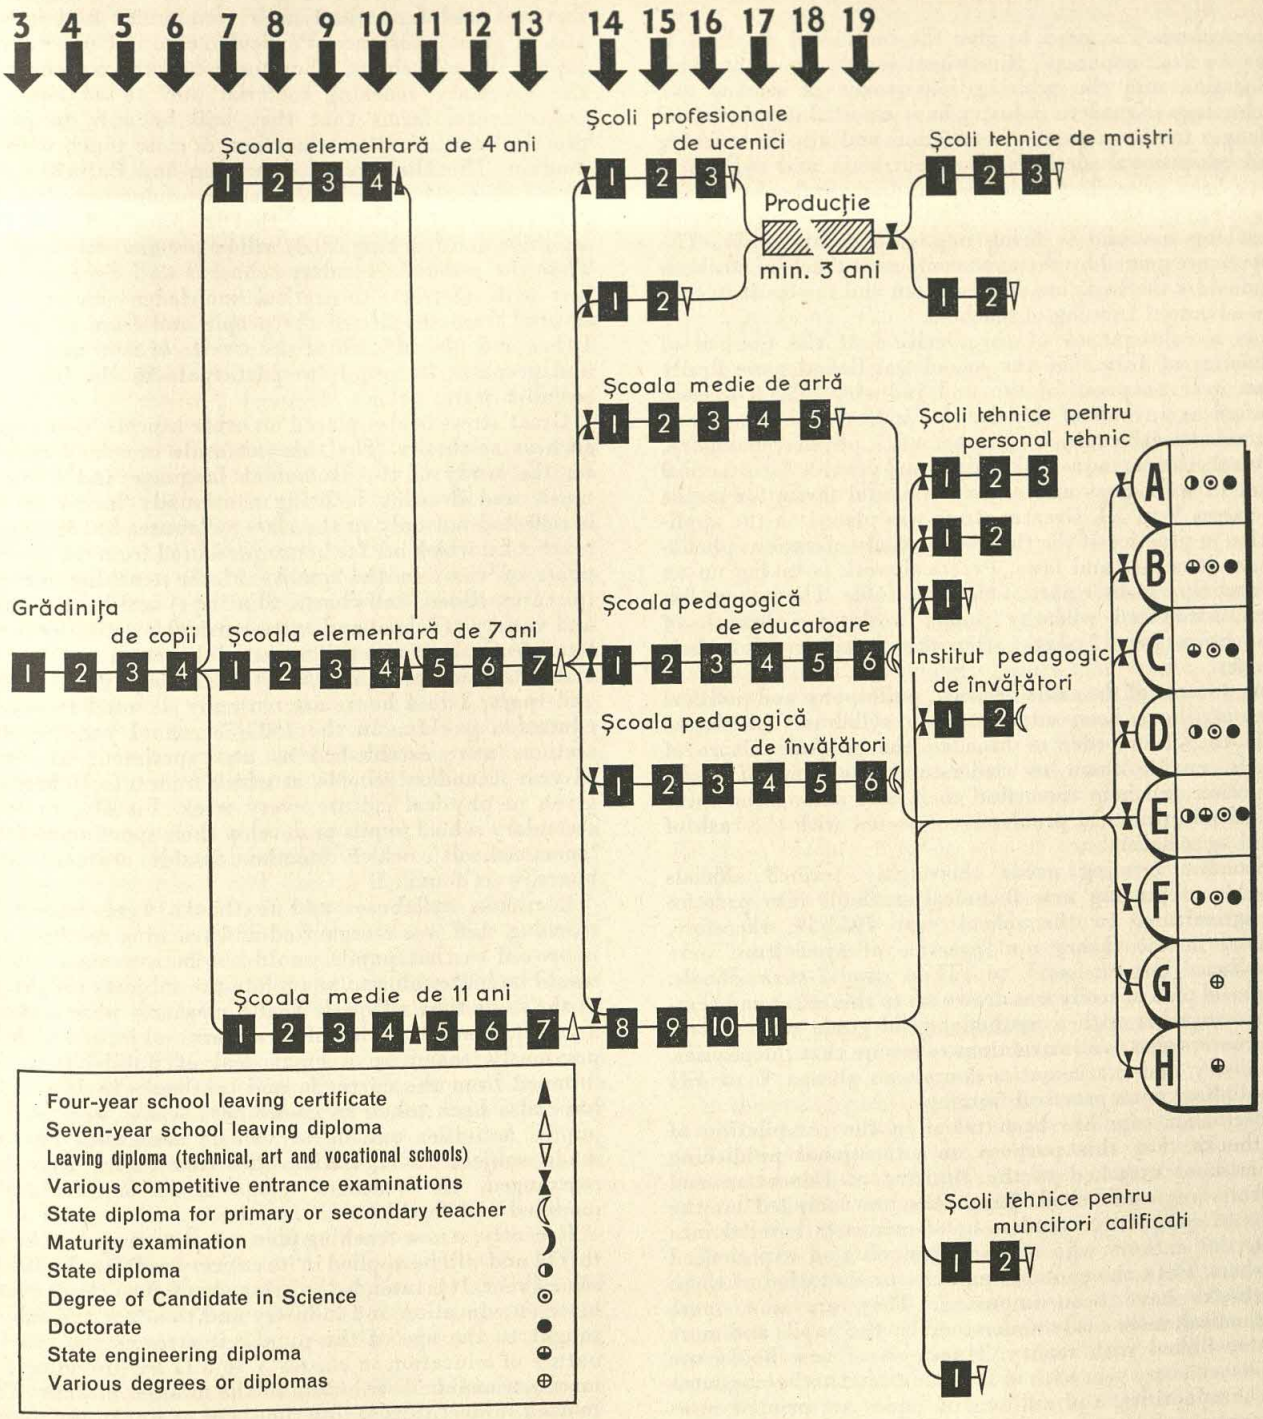
All pupils leaving school after the full 11-year course, whether at a technical or teachers' school or any other school of equivalent level, may enrol at any type of higher educational establishment provided that they pass the entrance examination.

At general secondary schools and teacher schools the year begins on 15 September and ends on 30 June. There are three terms of equal length. After the first and second terms pupils are given a fortnight's holiday and the principal holiday, lasting two and a half months, follows the end of the third term. There are six school days a week, and classes take up five or six hours daily.

At vocational and technical schools, the year begins on 1 September, ends on 30 June and is divided into two terms. There is a fortnight's holiday after the first term and a two-month summer holiday after the second.

General secondary schools

In the Rumanian People's Republic, the school providing a 7-year course of study (the incomplete secondary school) gradually developed after 1948; it became a general and compulsory type of school firstly in the cities and, after 1955, at workers' centres and in the chief towns of the districts. After the 1958/59 school year, under a decision of the Council of Ministers in August 1958, the 7-year cycle became general and compulsory for all children in the rural areas in which such schools were situated. Today, illiteracy among the masses in Rumania has been eliminated. All children of school age attend classes I to IV and 85 per cent of them then pass into class V. In conformity with the state plan, the 7-year school period will become the general rule throughout the country within the next few years. Thus, whereas in 1938 the *gimnaziu* classes were attended by only 119,110 pupils, today the first cycle of the general secondary school (classes V to VII) is open to the whole population. The number of pupils who have completed 4 years of elementary school and are attending the courses in classes V to VII is at present 501,260. Under the present system, the 7-year school is not subject to the limitations of the former *gimnaziu* which merely prepared pupils for the *liceu* or higher secondary school; it is now the principal institution for mass education giving every child and every citizen the opportunity to acquire a further general and technical education.



The second cycle of general secondary education (classes VIII to XI) also greatly expanded after the establishment of the People's Democracy. In 1938 Rumania possessed only 211 full secondary schools (*liceu*) attended by 29,004 pupils. Today there are 454 general secondary schools with an attendance of 181,069 pupils, i.e., six times as many as in 1938. The number of persons today who have completed their general secondary education is far in excess of the needs of higher education and of the country's needs in the higher ranks. Unlike the former *liceu*, the general secondary school is no longer exclusively a means of access to higher education; indeed, the majority of the students who terminate their general secondary studies and obtain a Maturity (secondary school leaving) certificate go on

GLOSSARY

grădiniţa de copii (kindergarten): pre-primary school.
institut pedagogic de învăţători: teacher training college.
producţie min. 3 ani: employment in industry for at least three years.
şcoala elementară de 4 ani: 4-year primary school.
şcoala elementară de 7 ani: 7-year school covering primary and lower secondary cycles.
şcoala medie de 11 ani (middle school): 11-year school covering complete primary and general secondary course.
şcoala medie de artă: vocational secondary school of art.
şcoala pedagogică de educatoare: teacher training school for women teachers in pre-primary schools.
şcoala pedagogică de învăţători: teacher training school for primary teachers.
şcoli profesionale de ucenici: vocational training schools for apprentices.
şcoli tehnice de maiştri: vocational training schools for foremen and master craftsmen.
şcoli tehnice pentru muncitori calificaţi: vocational training schools for skilled workers.
şcoli tehnice personal tehnic: vocational training schools for technicians.

Curriculum. The need to give the individual destined to live in contemporary Rumanian society a many-sided education and the growing importance of science and technology in modern industry have resulted in substantial changes in the content of education and also in teaching and educational methods. New curricula and syllabuses have been prescribed and new standard textbooks for the teaching of the various subjects have been produced. Teaching material is being improved continuously. The experience gained by the most competent teachers has been studied by the Institute of Education and the institutes for the advanced training of teachers.

As a consequence of the Decision of the Council of Ministers of July 1956 the school was linked more firmly than ever to practical life and industry. The curricula drafted as a result of this decision indicate a strong trend towards scientific subjects (mathematics, physics, chemistry, natural science, industrial design) and provide for practical work in workshops and on experimental farms for pupils in classes V to XI. Greater stress was placed on the application in practice of the theoretical study of various phenomena, processes and laws. Practical work is taking up an increasingly greater part of the time-table. The system has been introduced whereby pupils work in a branch of production for 12 days after the completion of their courses.

As a result of the same decision, philosophy and political economy have been added to the syllabuses of classes VIII to XI in order to broaden the general culture of pupils, enable them to understand the laws of social evolution and help them find their way among the theoretical and practical problems connected with the task of building socialism.

Socialist farming needs thoroughly trained officials capable of putting new technical methods into practice in agriculture. In the school year 1958/59, therefore, courses in the theory and practice of agriculture were introduced into classes V to VII in rural 7-year schools. A special plan of study was drawn up to this effect and textbooks together with a methodological guide were issued. There were also new instructions to ensure that the physics, chemistry and mathematics courses in classes V to VII should bear upon practical farming.

Particular care has been taken in the compilation of textbooks. For this purpose an educational publishing department attached to the Ministry of Education and Culture was established. Textbooks are compiled on the basis of competitive tenders or of contracts entered into with the authors who are well-trained and experienced teachers. Both the contents and the presentation of these textbooks have been improved. They are now more methodical, more easily understood by the pupils and more closely linked with reality. Hundreds of new books are published every year both in Rumanian and in the languages of the minorities, and millions of copies are printed so as to meet the ever-increasing needs of education.

Pupils increase their knowledge of the application of the various branches of science to production industries as a result of their practical training in the workshops and on experimental farms and through their participation in technical associations; their visits to industrial works, factories and farms and their community activities are also of great assistance. Particular care is being taken to supply the workshops, laboratories and the museums with the necessary teaching material and to so equip the experimental farms that they will be able to provide practical and scientific education, in close touch with production. The Ministry of Education and Culture has set up establishments specifically for the production of teaching material and equipment so that supplies sufficient to fill scientific and teaching needs will be permanently available. Thus the general secondary school is no longer concerned just with abstract, theoretical knowledge—an institution severed from the life of the people and from production. It has now placed itself at the service of man and society, and prepares its pupils to participate in the life of the socialist State.

Great stress is also placed on other aspects of education, such as aesthetics. The time set aside in school curricula for the study of the Rumanian language and literature, music and drawing is being continually increased. This is reflected not only in the class syllabuses but in the new textbooks, which are far better presented from the aesthetic point of view, in the quality of the teaching materials (pictures, slides, wall charts, filmstrips) and in the number and variety of school and extra-curricular activities (school fêtes, festivals, competitions, art clubs, etc.).

A prominent place is also set aside for physical training and sport; 3 to 4 hours are normally devoted to physical education weekly. In the 1957/58 school year six sport sections were established as an experiment at certain 11-year secondary schools, at which from 6 to 10 hours are given to physical culture every week. Finally, to enable secondary school pupils to develop their sporting aptitudes 'sport schools', which function outside ordinary school hours, were founded.

Curricula, syllabuses and textbooks were revised, the teaching staff was reorganized and teaching methods were improved so that pupils would not be overburdened and would be better able to assimilate the subjects taught, and at the same time adequate health measures were taken. As a result, a whole series of secondary subjects which had previously taken up a great deal of pupils' time were dropped from the curricula and textbooks in 1958. Steps have also been taken to co-ordinate school work and the pupils' activities outside of school; homework has been made subject to regulation, the time-tables have been rearranged, the teachers' plans of lessons have been modified and the like.

Recently, a new teaching plan was drawn up for classes I to VII and will be applied in its entirety as from the 1959/60 school year. It is intended to bring about even closer contact between education and industry and to adapt the subjects taught to the age of the pupils; it stresses the practical nature of education in classes V to VII by providing for a more reasonable distribution of the number of hours given to each subject thus saving time. For example, the number of hours set aside for classes V to VII—in which until now the pupils have been heavily burdened—has been drastically cut. The number of hours per week in class V has been cut from 37 hours in rural and 36 in urban schools

to 28 hours, and in classes VI and VII it has been reduced from 35 to 30.

In line with this plan, new programmes of work and new and improved textbooks have been compiled more closely in touch with practical life.

Vocational and technical schools

In the Rumanian People's Republic, the training of the skilled workers and medium-grade technicians needed for industry, for the health services and for promoting the cultural level of the population, is provided in different types of school: skilled workers are trained at the vocational apprenticeship schools which provide 2-, 3- or 4-year courses, at trades schools (4 years), agricultural schools (3 years) or technical schools (1 or 2 years). Courses for more highly qualified technicians are given at the foremen's schools (3-year courses), technical schools (3 or 4 years) or art schools (4 years).

Pupils who have completed the 7-year compulsory period may enrol at apprenticeship schools, trade schools, agricultural schools and art schools. The foremen's schools are reserved for the most competent workers who have passed through the ordinary vocational schools, and who have at least 3 years of practical industrial experience. Pupils who have completed the full 11-year general secondary course are admitted to the technical schools. Vocational and technical education is directly linked with production so that full advantage can be taken of practical instruction in the work places. Vocational and technical schools are now attached to large industrial undertakings, factories and works, machine and tractor stations, state farms, experimental farms, constructional works, health centres, etc.

The schools at which medium-grade skilled workers and technicians are trained are subordinate to the competent ministries, institutions and central bodies. The Ministry of Education and Culture co-ordinates, directs and controls the educational process in all vocational and technical schools so as to ensure uniform instruction and the application of appropriate teaching methods. The Ministry must also approve the special teaching plans and curricula drawn up by the ministries and central bodies responsible for such schools. The general cultural and general technical curricula are the responsibility of the Ministry of Education and Culture. The textbooks required for vocational and technical education are in every case compiled by the relevant ministry in co-operation with the Ministry of Education and Culture.

The trades and agricultural schools established for the purpose of training the skilled workers needed in the various branches of the nation's economy are subordinate to the People's Councils and are supervised and directed by the Ministry of Education and Culture in the same way as the general secondary schools and teacher training schools.

The Ministry of Health and Social Welfare has organized special vocational schools to train infirm and disabled children for an occupation.

During the first period following the educational reform (August 1948–55), two types of schools were established for the training of medium-grade skilled workers and technicians: (a) vocational schools with 2- or 3-year courses (according to the occupation) for persons who had completed at least 4 years of primary school; and (b) intermediate technical schools with a 4-year course open to persons who had completed the 7-year cycle. Their purpose was to train medium-grade technicians by providing them with the scientific knowledge required for the occupation they intended to enter.

The growing need, however, for a thorough theoretical and technical education owing to the expansion of socialist industry and agriculture added to the increase in the number of pupils completing the 7-year cycle and general secondary education, made the reorganization of vocational and technical education both essential and possible. Since 1955, only applicants who have completed the 7-year course have been admitted to vocational schools and only those who have completed secondary school have been admitted to technical schools. These new provisions make it possible to ensure that holders of diplomas from vocational and technical schools have received a thorough theoretical and practical training adequate for the requirements of the country's socialist structure.

Teacher training schools

In the cultural revolution now taking place in Rumania, the instruction of the requisite teaching staff is an urgent matter. The number of teacher training colleges had to be increased and the training of men and women primary teachers and pre-primary teachers (women) had to be much improved. For this reason two systems of teacher training were introduced as an experiment in 1956. Under one system some students are trained at male or female teachers' schools (or the pre-primary women teachers' institutions) where the course lasts 6 years (instead of 4 as formerly); for these teacher training schools candidates must have completed the 7-year cycle. Under the other system the students enter pedagogical institutes where the course is 2 years and in this case candidates must have completed the 11-year course at a secondary school and have obtained the Maturity (upper secondary school leaving) certificate.

The curriculum at the 6-year teacher training schools ensures that the students shall receive a general secondary education and at the same time the theoretical and practical training they require.

In the pedagogical institutes the curriculum provides the pupil-teachers principally with a psychological, pedagogical and methodological training. Stress is placed on the methods used in teaching the various subjects and on the acquisition of some teaching experience through prolonged contact with the school and constant teaching practice.

From the experience gathered so far through the application of the two above-mentioned systems of training it has not been possible to draw any definite conclusion as to which is the better. Nevertheless, the statistics and the results obtained show that this experiment has been both interesting and valuable. It will certainly contribute to an improvement in the system of teacher training and help to establish scientifically a suitable method of teaching and teacher instruction in the secondary teacher training schools.

The teacher training schools and pedagogical institutes form part of the network for which the Ministry of

Education and Culture is responsible. They are supervised and administered by the People's Councils in the same way as general secondary schools.

Art schools

The 1948 educational reform also provided for the establishment of a new type of secondary school, i.e., art schools (music, ballet, plastic arts). Structurally, these schools are very similar to the 11-year general secondary schools. The course, however, lasts 12 years and there is a special curriculum designed to give pupils the opportunity of developing their aptitudes in a particular branch of art. The number of these schools is expanding and they exist in many urban centres. There are now 28 art schools with a 7-year course and 12 schools which give the complete 12-year course.

In the larger towns there are certain art schools with a special syllabus to provide their pupils with the opportunity of cultivating their artistic aptitudes. The lessons take up three hours daily on three days a week, outside school hours. Students attend the usual general secondary schools simultaneously.

The art schools are organized and administered directly by the Ministry of Education and Culture (Cultural Department, Art Education Section). They provide boarding accommodation and canteens. Most pupils not resident in the area of the schools they attend receive government scholarships.

Other specialized schools

In the Rumanian People's Republic, in addition to day schools, there are also evening classes and voluntary courses. In accordance with the laws and decisions in force, these courses correspond to the general secondary schools (classes V to VII and VIII to XI) or the technical schools for foremen. Workers are thus enabled to continue their studies without interrupting their employment. The curricula at evening secondary schools are based on those of the day schools, subject to a maximum of 20 hours a week.

Out-of-class activities

Out-of-class activities have an important place in the training of the pupils in secondary schools, both general and technical.

Such activities help pupils use their leisure in a pleasant and rational way by enabling them to cultivate their own interests and talents, and to broaden their outlook by stressing the practical side of their training and preparing them to live in a manner useful to the community. These activities are most varied, i.e., private reading, sports, engineering groups, literary and art groups, groups of young naturalists, groups for handicrafts, outings for the purpose of showing pupils the beauty and wealth of their country, factory and farm work, visits to monuments, art treasures, historic places, etc.

Youth movements such as the Union of Young Workers and the Pioneers play a considerable part in organizing such activities. They organize various literary, art or sport competitions, more particularly the '*Spartakiades* for mathematicians and physicists', which attract large numbers. Pupils can also take part in school championships, athletics, gymnastics, volley-ball, basket-ball, hand-ball, swimming, skiing. The youth organizations also arrange for the participation of pupils in various civic activities such as decorating their schools or towns, gardening, harvesting, etc. In addition, pupils are encouraged to take part in the social life and internal organization of the school, to arrange various cultural and civic functions at cultural centres, trade union clubs, industrial works and factories, collective farms, holiday camps and colonies, etc. The educational effect of such activities is both considerable and durable. They supplement teaching activities and develop the love of study and practical action among the pupils. Special emphasis is placed on individual enterprise, on independent work and on the creative talent of pupils.

The activities of the schools and youth movements in this regard are assisted by various non-educational institutions such as theatres, cinemas, trade union clubs, groups of young naturalists, etc.

The Pioneer's Palace at Bucarest and the Pioneer Club premises in the large towns and district centres also make an important contribution to the organization of out-of-school activities and the education of the young. Special attention is paid to organizing the use of pupils' leisure time during their holidays. Every year, tens of thousands of schoolchildren spend part of their holidays at youth camps in the loveliest parts of the country, in the mountains or by the sea. At these camps various educational and recreational activities are organized such as walks, social evenings, camp fires, sports, etc. The number of pupils spending their holidays at youth camps increases annually.

Teaching staff

A great deal of care is given to the preparation and in-service training of secondary school teachers.

Teachers of all subjects and at all types of secondary schools receive their training at institutions of higher education, where the courses last from 5 to 6 years. Teachers appointed to classes V to VII specialize in two subjects, and this qualifies them to take complete charge of a class.

To enable teachers to attend advanced and refresher courses, the Decision of the Council of Ministers of 16 August 1951 provided for the establishment of four inter-regional institutes for in-service teacher training. Under the Decision of the Council of Ministers of 12 August 1954, all secondary school teachers must attend refresher courses at these institutes, where they must take up some individual studies; furthermore, every 5 years they must take the competitive examinations and attend the refresher courses held in summer. Great importance is attached to the instruction of specialists in pedagogics and methodology and to comparing experiences. At these refresher courses, the experiences of the better schools and most competent teachers are studied. The institutes for in-service training are staffed by highly qualified teachers who must have had the same training as university teaching staff and are paid on the same salary scale.

TRENDS AND PROBLEMS

The very rapid rate of expansion of the country's economy, of the sciences, of technology and of culture accompanying the building up of the socialist society offers new prospects of development to all the types of secondary schools existing in the Rumanian People's Republic.

The wide range of technical and vocational schools now existing, for example the metallurgy schools, electricity schools, chemistry schools, textile schools, schools serving the oil industry, agricultural and forestry schools, commercial schools, art schools, sport schools, etc., guarantees an adequate vocational training to specialists in a large number of fields. The curricula at the vocational and technical schools and schools for foremen provide pupils with a general education, training in the trade selected and practical instruction acquired in the workshops and in production.

The present trend of education in the general secondary schools is to accentuate and intensify the scientific education at the 7-year schools by providing more and more practical classes for the various subjects. In classes VIII to XI emphasis is laid also on general and polytechnical education, pupils thus obtaining a scientific view of the universe. There is an ever-growing conviction that a general secondary education should include a large measure of practical activity so that pupils while receiving a thorough general and polytechnical education should be enabled to learn a trade or craft. This factor has become increasingly urgent in the last few years, since owing to the expansion of secondary education most of the pupils on completion of the 11 years at a general secondary school must start directly in a productive branch.

Moreover, both pupils and parents are openly expressing their wish for the schools to provide a vocational education. The experience obtained until now proves that this is not only necessary but possible. Thus the pupils in classes VIII to XI at the experimental secondary school No. 4 ('Aurel Vlaicou', Bucarest) have spent five days weekly in class and one day doing practical work in the workshops of the Rumanian Railways and thus obtained their certificates as skilled workers (turners, milling machine workers, etc.) as well as the Maturity certificate. Secondary school pupils may also obtain a similar training in agriculture.

Taking into account the current evolution affecting the courses at secondary vocational and technical schools, characterized by a broader general education and technical training it can justifiably be claimed that general and technical secondary education are continually being brought closer together. In this manner the age-old gap separating intellectual and physical labour is being bridged and the positive needs of a society which in this age of automation and mechanization requires workers with a broad outlook, a solid general education and a thorough technical knowledge are being filled.

At present the chief aims of the authorities of the Rumanian People's Republic with respect to secondary education are as follows: to make a 7-year study system general without further delay; to expand general secondary education and to reorganize it by bringing it into an increasingly closer relationship with productive activity; to train pupils with a view to a practical occupation; to promote vocational and technical education in the light of the economic needs and the scientific and technological requirements of the country; to allow a greater share to be given to theoretical knowledge and general culture in the vocational and technical schools; gradually to improve methods of education by work in the productive sectors.

STATISTICS

Population (mid-year 1958 estimate): 18,059,000.
Area: 91,700 square miles: 237,500 square kilometres.
Population density: 197 per square mile; 76 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, the total enrolment of 2.5 million pupils (not including special and post-primary education) was about 14 per cent of the total population. (In the last edition of *World Survey of Education*[1] it was shown that about 2,000 pupils were enrolled in special schools for handicapped children and about 427,000 in various types of evening and correspondence courses, including courses for illiterates.) Of the reported school enrolment, 11 per cent were pupils in nursery schools, 56 per cent in classes I to IV, 18 per cent in classes V to VII, and 6 per cent in classes VIII to XI. Vocational schools accounted for another 5 per cent, teacher training schools 0.1 per cent, and higher education 3 per cent. The proportion of girls was 48 per cent in the general primary and secondary schools. The average number of pupils per teacher in the 4-, 7- and 11-year schools altogether was 22. Between 1953 and 1957, primary education enrolment increased by 9 per cent, but total secondary enrolment decreased by 11 per cent. (See table.)

Enrolment trends in secondary education. Comparable data are not available to show the trends in secondary enrolment before 1953. However, it may be seen from the table that

1. *World Survey of Education*: II—*Primary Education.* Paris, Unesco, 1958, 1380 pp.

there has been, at least in the most recent years, a substantial decline in the enrolment figures for vocational and teacher training schools, which is not quite offset by the increase in the enrolment of general secondary schools (classes VIII to XI). The average total enrolment in all types of secondary education for the period 1955–57 was 271,000, or 19 per cent of the estimated population 15–19 years old.

Educational finance, 1959. In the state budget for 1959, an amount of 3,043 million lei was allocated for education. This represented an average of about 165 lei per inhabitant. Official exchange rate: 1 leu = 0.17 U.S. dollar approx.).

Note. Data on special education and post-school and adult education are not available.

1. Including special nursery schools for deficient children.
2. These grades, for children 12–14 years of age, which are described in the text as constituting an incomplete secondary school, are included here with primary education in order to maintain continuity of statistics reported for previous years in *World Survey of Education — II.*
3. Number of 4-year schools.
4. Number of 7-year schools.
5. Including teachers of teacher training schools and of general education classes VIII to XI.
6. Teaching staff of classes I to XI.
7. Number of 11-year schools. Enrolment in day and evening classes.
8. Included in primary education.
9. Including teachers of evening schools and correspondence courses.

SAN MARINO

THE EDUCATIONAL SYSTEM

An Educational Statute, having the force of law, was approved by the Government (the *Consiglio Grande e Generale*) on 12 August 1946.

School administration is headed by a Director of Education (*Deputato agli Studi*), whose functions are equivalent to those of a Minister of Education; his is, in fact, one of the most important of the 10 government departments. He is assisted by a technical advisory body. This branch of the government service consists of a Directorate of Primary Schools and a Directorate of Secondary Schools.

All schools are maintained entirely by the State except the nursery schools, and even these receive considerable government subsidies.

Primary education is free and compulsory for all children between the age of 6 and 12.

TYPES OF SECONDARY EDUCATION

The organization and content of education are practically the same as in Italy. After completing the 5-year primary school and passing the primary school certificate examination or *licenza elementare* the pupil sits for a separate entrance examination to the intermediate school (*scuola media*). Pupils from the fourth class of the primary school can also sit for this entrance examination, without holding the primary school certificate, provided they have reached the age of 10.

At the end of their third year in the *scuola media*, pupils sit for the intermediate school certificate or *licenza media*, which entitles them to enter the upper secondary school. There is only one school at this level, a classical secondary school comprising a 2-year *ginnasio* followed by a 3-year *liceo classico*. Pupils who have gained their *licenza media* and want to pursue other secondary studies, enter the appropriate type of school in Italy. Similarly, students who graduate from the San Marino *liceo* with the secondary leaving examination (*maturità*) may apply for admission to an Italian university or other institution of higher education.

[*Text prepared by the Unesco Secretariat in June 1960.*]

STATISTICS

Population (mid-year 1958 estimate): 15,000.
Area: 24 square miles; 61 square kilometres.
Population density: 625 per square mile; 246 per square kilometre.

In the school year 1957/58 there were in San Marino 35 primary schools, 1 secondary and 1 vocational school. Enrolment figures are not available.

Some data relating to 1950–54 were presented in the previous edition of the *World Survey of Education:* II—*Primary Education.*

SAUDI ARABIA

EDUCATIONAL SYSTEM

Religious schools are the oldest educational institutions in Saudi Arabia, and they still continue at primary, secondary and higher levels. Alongside them a system of secular schools has developed, providing primary, secondary and technical education. Education at all levels is free.

The Government first assumed responsibility for education in 1926 when a Directorate of Education was established. In 1953 this was raised to the status of a Ministry. Within the framework of the Ministry, planning, guidance, and technical supervision are assigned to a General Directorate of Education, and the recent establishment of a Directorate of Technical Supervision has made

possible the separation of responsibility for technical matters and administration. The latter is entrusted to a Directorate of General Administration, and there is also a Directorate of Financial Administration. Recently there has been established a Directorate of Primary Education and a Directorate of Secondary Education. A Division of Cultural Relations prepares reports for international conferences on education and studies their recommendations, and a Division of Educational Statistics collects and makes available data needed for the establishment of educational policy. In 1954 medical services for schools were set up in four principal towns and the other local education administrations were later provided with similar services.

The Minister of Education is assisted by a Higher Council for Education and a Bureau of Advisers. The Ministry is responsible for laying down policy, for the development and revision of curricula and for the selection of textbooks. There are educational district administrations which are responsible for the implementation of the Ministry's policy and programmes in their respective districts (17 in all) and for the supervision and control of the schools under their jurisdiction.

SECONDARY EDUCATION

The general requirement for entry to all types of secondary school is completion of the 6-year primary course and a pass in the Primary School Certificate examination. The general secondary school provides a 6-year course divided into two cycles each of which leads to a certificate examination. The curriculum includes religion, Arabic language and literature, mathematics (arithmetic, geometry, algebra and mechanics), science (physics, chemistry, botany and zoology), social studies (history, geography, civics, education and psychology), foreign languages (English and French), art education and physical education.

During the first 4 years all pupils take the same subjects, but from the beginning of the fifth year and for the last 2 years they have the opportunity of choosing between a literary course and a scientific course. Both courses lead to the Secondary School Certificate examination (second cycle), and students who pass this examination are entitled to grants for higher study abroad and to admission to the Teachers' College. A project for the establishment of a Saudi Arabian university is under way.

In addition to the general secondary school, other types of secondary level education are provided in such establishments as Dar at-Tawhīd, which offers a 5-year religious course leading to higher studies in Islamic law; al-Ma'had al-'ilmi, which offers a 5-year teacher training course qualifying students either for teaching in the upper grades of the primary school or for admission to the Teachers' College, which trains teachers for secondary schools; primary teacher training institutes, which offer a 3-year course intended for prospective teachers in the lower grades of the primary school; the intermediate commercial school, which provides a 3-year terminal course; and the industrial schools, which provide a 5-year course.

Teachers of Arabic in secondary schools are often trained locally; teachers of other subjects are either Saudi Arabians trained abroad or expatriate staff recruited in other Arab countries.

Great importance is attached in Saudi Arabian schools to out-of-class activities. Physical training and sports have been strongly encouraged by the authorities, and schools have been fully provided with staff and equipment for the promotion of games and of the team and sporting spirit. A number of training centres have been opened for the benefit of students at schools without adequate playgrounds. Scouting camps, trips and inter-school contests have been organized. School societies attract a large number of pupils and provide them with useful leisure-time activities ranging from the artistic and social to the cultural and intellectual.

TRENDS AND PROBLEMS

The current five-year plan for education includes a defined enrolment policy which aims at keeping a balance between general secondary education on the one hand and technical and teacher training institutions on the other. This will help meet the country's needs for technicians and skilled workers and for trained teachers to staff the rapidly-expanding primary school system.

The plan therefore involves the diversification of education after the primary stage. The Ministry had already begun six years ago to establish industrial schools with this end in view and there are now seven such schools in operation. In 1959 four intermediate commercial schools were opened, and the Ministry is considering the establishment of an intermediate agricultural school in 1960. This trend has created the need for an educational guidance service to select the students for vocational education.

Although curricula and methods at all levels are at present felt to be reasonably well adapted to the conditions and needs of the country, they will be subject to revision by the Ministry after the diversification policy has been developed.

The chief difficulties the Ministry is facing in implementing its programme arise from the fact that much of the country consists of sparsely inhabited areas where nomadic tribes form a substantial proportion of the population. Another major problem is the shortage of Saudi Arabian teachers. Primary teacher training facilities are being expanded and it is hoped that when the Saudi university is in full operation in the near future the shortage of locally-trained teachers for secondary schools will gradually become less acute.

[*Text prepared by the Unesco Secretariat in December 1959 from official sources.*]

BIBLIOGRAPHY

'The dawn of a new era of public education in Saudi Arabia', *The Islamic review* (Woking, England), January 1955, pp. 16–19.

STATISTICS

Population (mid-year 1958 estimate): 6,036,000.
Area: 617,762 square miles; 1,600,000 square kilometres.
Population density: 10 per square mile; 4 per square kilometre.

Summary of school statistics, 1953–58. In 1958/59, there were 100,000 pupils enrolled in all types of schools, not including higher education and adult education. This represented less than 2 per cent of the total population. About 94 per cent of these pupils were enrolled in primary schools, where there were on the average 27 pupils per teacher. The pupil-teacher ratio was 11 in the secondary schools and only 7 in the technical schools. Between 1953 and 1958 primary school enrolment more than doubled, while secondary and technical school enrolment more than quadrupled. (See Table 1.)

Enrolment trends in secondary education, 1949–58. The number of pupils in all types of secondary schools increased nearly six times between 1949 and 1958. Nevertheless, the average total enrolment for the period 1955–58 was still less than 1 per cent of the estimated population 15–19 years old. (See Table 2.)

Educational finance, 1958/59. The budget for education in 1958/59 amounted to 108,686,893 riyals. This represented an average expenditure of less than 20 riyals per inhabitant. Official exchange rate: 1 riyal = 0.27 U.S. dollar (approx.).

1. Including teacher training.

SIKKIM

The Government of Sikkim runs three secondary institutions and aids two others; three institutions are co-educational, one is for boys and one for girls. A Basic Training Institute trains teachers for the primary schools. For post-secondary study, the Sikkimese students in mining, civil engineering, mechanical engineering, law, medicine, arts, advanced forestry, agriculture, education, social science, etc., are admitted to institutions in India on stipends provided by India and the Government of Sikkim.

The Government of Sikkim runs one institution for vocational study where selected stipendiaries receive training for 1- and 3-year courses in carpet-making, weaving, carpentry, hand-made paper manufacturing, handicrafts, including doll-making, and painting. An adult training centre attached to the institute gives primary education to the trainees. On completion of their course the trainees receive initial financial assistance from the Government of Sikkim.

The local hospital provides training in midwifery.

After completion of the School Leaving Examination, selected Sikkimese students are sent to India for various forms of vocational training in the National Extension service for the undergraduate course in veterinary science and for training as overseers, draughtsmen, etc.

[*Information provided by the Ministry of Education, Government of India, December 1959.*]

STATISTICS

Population (mid-year 1958 estimate): 150,000.
Area: 2,744 square miles; 7,107 square kilometres.
Population density: 55 per square mile; 21 per square kilometre.

SPAIN

THE EDUCATIONAL SYSTEM

The Spanish Constitution, which is uncodified, is defined by Article 10 of the Law of Succession as being comprehended in five basic laws: the Spanish Citizenship Statute of 17 July 1945; the Statute of Labour of 9 March 1938; the Parliament Bill of 17 July 1942; the Law of Succession of 26 July 1947 and the National Referendum Act of October 1945. Education is referred to in the first two of these enactments.

Article 5 of the Spanish Citizenship Statute reads: 'All Spaniards shall be entitled to receive education and instruction and shall be under a duty to acquire them, whether in their family or in private or public institutions as they may freely elect. The State shall ensure that no talent is frustrated for lack of financial means.'

The Statute of Labour of 9 March 1938—coupled with more extended declarations about the programmes—represents the social and economic policy of the present Government. There are 16 of these declarations; the following are the passages relating to education and instruction:

'Steps shall be taken to establish the institutions necessary to enable the workers, in their free time and holiday periods, to enjoy the treasures of culture' (point two of the second declaration).

'The State shall devote special attention to the technical training of farm workers, enabling them to execute all the tasks required for agricultural production' (point two of the fifth declaration).

'The Sindicato Vertical may initiate, maintain or supervise research organizations, associations for moral, physical and vocational education, provident and welfare societies and social organizations concerned with the elements of production' (point six of the thirteenth declaration).

Everything concerning education in general comes under the Ministry of Education, though other ministries and public and private bodies have educational institutions under their direction which are governed by the general regulations.

The Ministry of Education is in charge of the organization of education and is responsible for regulating and maintaining all the activities of state educational institutions and for approving and regulating the activities of private schools.

The provincial authorities (*diputaciones*) give support to philanthropic educational institutions, while the municipalities contribute to the maintenance of local educational institutions, especially primary schools.

The Government's work in education is supported and supplemented by the activities of private bodies which found and run many large institutions at all levels of education; quite a high percentage of the total school population attends such institutions.

The structure of the school system is shown in the diagram on page 1017.

THE DEVELOPMENT OF SECONDARY EDUCATION

At the beginning of the twentieth century secondary education was not regarded as a system of education in its own right but rather as an essential preliminary to higher education, preparing pupils for the *bachillerato* certificate, the basic qualification for university entrance. In the last 20 years this concept has undergone substantial revision, so that secondary education now has a character of its own, its purpose being to further the all-round education of the individual and to equip him for the most effective pursuit of his vocation, not just for university.

The Act of 20 September 1938 made sweeping reforms in the policy and organization of secondary education, affirming the principles of freedom of teaching and humanistic training, and establishing the system of cycles. The Primary Education Act of 17 July 1945 established for the first time in the primary school system a fourth stage, known as the pre-vocational stage, leading on to vocational training proper, which is regarded as a prolongation of this period of initiation. This fourth stage is for children from 12 to 15 years of age. The same Act establishes, as a special kind of fourth stage, adult classes in public or private schools for persons over 15 years of age. These serve the twofold purpose of rounding off the primary education of those who have had some schooling, however rudimentary, and of giving them basic or more advanced vocational training. Attendance at these classes is compulsory for all who did not qualify for a primary school certificate because they had not passed through the requisite number of grades.

The Act of 16 July 1949 established vocational secondary education, creating a second type of baccalaureate course (*bachillerato laboral*) with initial specialization in the techniques of agriculture, industry or other activities as well as the basic disciplines of a liberal education.

The Secondary Education (Organization) Act of 26 February 1953 defined the legal status of secondary education, explicitly enunciating and safeguarding the rights of the State, the Church and the family in secondary education, providing for state inspection of all schools, enunciating or reaffirming the principles of teaching and the technical provisions for the substantive reform of this level of education in Spain, laying down standards of social justice designed to foster fuller participation of, and greater solidarity between, all sectors of youth in secondary education, and establishing the guiding principles for the economic assistance of all teaching institutions, whether state or not, that require it. The Act also sought to lighten the overloaded curricula to enable pupils to work better on essential subjects and to reduce the number of hours of study so that they might have more time for sport and family life. It established an intermediate examination at the end of the fourth year, introduced practical improvements in the actual holding of examinations and offered a

choice between the arts and the science sides in the last two years at school.

The Commercial Education (Organization) Act of 17 July 1953 co-ordinated instruction in commercial subjects, while the Decree of 23 July 1953 laid down the curricula for the various levels of commercial education and fixed the examinations, levels of instruction, diplomas awarded and their equivalent value.

The Technical Education Act of 20 July 1957 established the various forms of technical training to be offered, making the system sufficiently flexible for it to keep pace with the rapid development of technology. The technical schools at the secondary level provide specialized training of a pre-eminently practical kind, an outstanding feature of this Act being the way in which the various specialities and levels are co-ordinated between themselves and with other related dispositions.

Legal basis

The principal laws and regulations governing secondary education (general and vocational) may be summarized as follows:

General secondary studies. Secondary Education (Organization) Act of 26 February 1953. Decree of 31 May 1957 promulgating the new curriculum for the baccalaureate, now in force. Decree of 13 September 1957 prescribing the tests to be taken in the pre-university year, which follows the completion of the 6-year general baccalaureate course. Ministerial Order of 11 November 1958 introducing a scheme for adapting the lower general baccalaureate course (4 years) to the corresponding stage of the vocational baccalaureate course, and enabling pupils to transfer from one to the other.

Commercial studies. Decree of 16 March 1956 amending the curriculum and conditions for admission. Ministerial Order of 13 March 1957 on syllabus adjustment. Ministerial Order of 28 May 1957 on transfer requirements for students. Commercial Education (Organization) Act of 17 July 1957. Decree of 23 July 1957 promulgating the syllabus, later amended. Ministerial Order of 25 March 1958 authorizing transfers from the baccalaureate course to commercial studies and vice versa.

Primary teacher training schools (escuelas del magisterio). Decree of 7 July 1950 approving the regulations for primary teacher training schools.

Vocational secondary baccalaureate (bachillerato laboral). Act of 16 July 1949. Decree of 21 December 1956 promulgating curricula for arable and livestock farming, industrial and mining and maritime and fishing courses. Decree of 5 September 1958 establishing a course of management studies.

Technical studies. Act of 20 July 1957.

Vocational training for industry. Act of 16 July 1949.

Central School of Languages (Escuela Central de Idiomas). Regulations for the Central School of Languages approved by Royal Decree dated 14 October 1930.

GLOSSARY

aprendizaje: see *formación profesional industrial.*

escuela de comercio: vocational secondary school of commerce.

escuela de magisterio: teacher training school.

escuela de párvulos (infant school): see *escuela maternal.*

escuela maternal y escuela de párvulos (nursery school and infant school): types of pre-primary school, providing the initiatory stage (*período de iniciación*) of primary education.

escuela primaria: primary school. The complete range of schooling covered by the term 'primary education' (*enseñanza primaria*) covers four stages: an initiatory or pre-primary stage (*período de iniciación*); an elementary primary stage (*período de enseñanza elemental*); an advanced or complementary stage (*período de perfeccionamiento*); and a pre-vocational stage (*iniciación profesional*).

escuela técnica media: secondary level technical school; all pupils must take a preliminary or selective course (S) before beginning specialized technical studies (industrial, agricultural, etc.).

formación profesional industrial: industrial vocational training covering three stages: pre-apprenticeship (*preaprendizaje*), apprenticeship (*aprendizaje*) leading to certification as an entered apprentice, and the course leading to qualification as skilled worker (*maestría*)

iniciación profesional: pre-vocational training (see *escuela primaria*).

instituto o colegio (institute or college): state or private general secondary school; the secondary course proper leading to the upper *bachillerato* (see under examinations) lasts 6 years, but pupils wishing to continue at university are required to take an additional one-year pre-university course (P).

instituto laboral: vocational secondary school; the complete 7-year course qualifies for admission to higher technical schools and pupils taking an appropriate bridge course (*curso de transformación*, shown as T) may go on to certain faculties of the university.

maestría: see *formación profesional industrial.*

período de . . .: see *escuela primaria.*

preaprendizaje: see *formación profesional industrial.*

HIGHER EDUCATION

A. Faculties of Law, and Philosophy and Letters.
B. Faculty of Medicine.
C. Faculties of Political Science, Economics, Pharmacy, Veterinary Science.
D. Faculty of Science.
E. Higher technical schools.

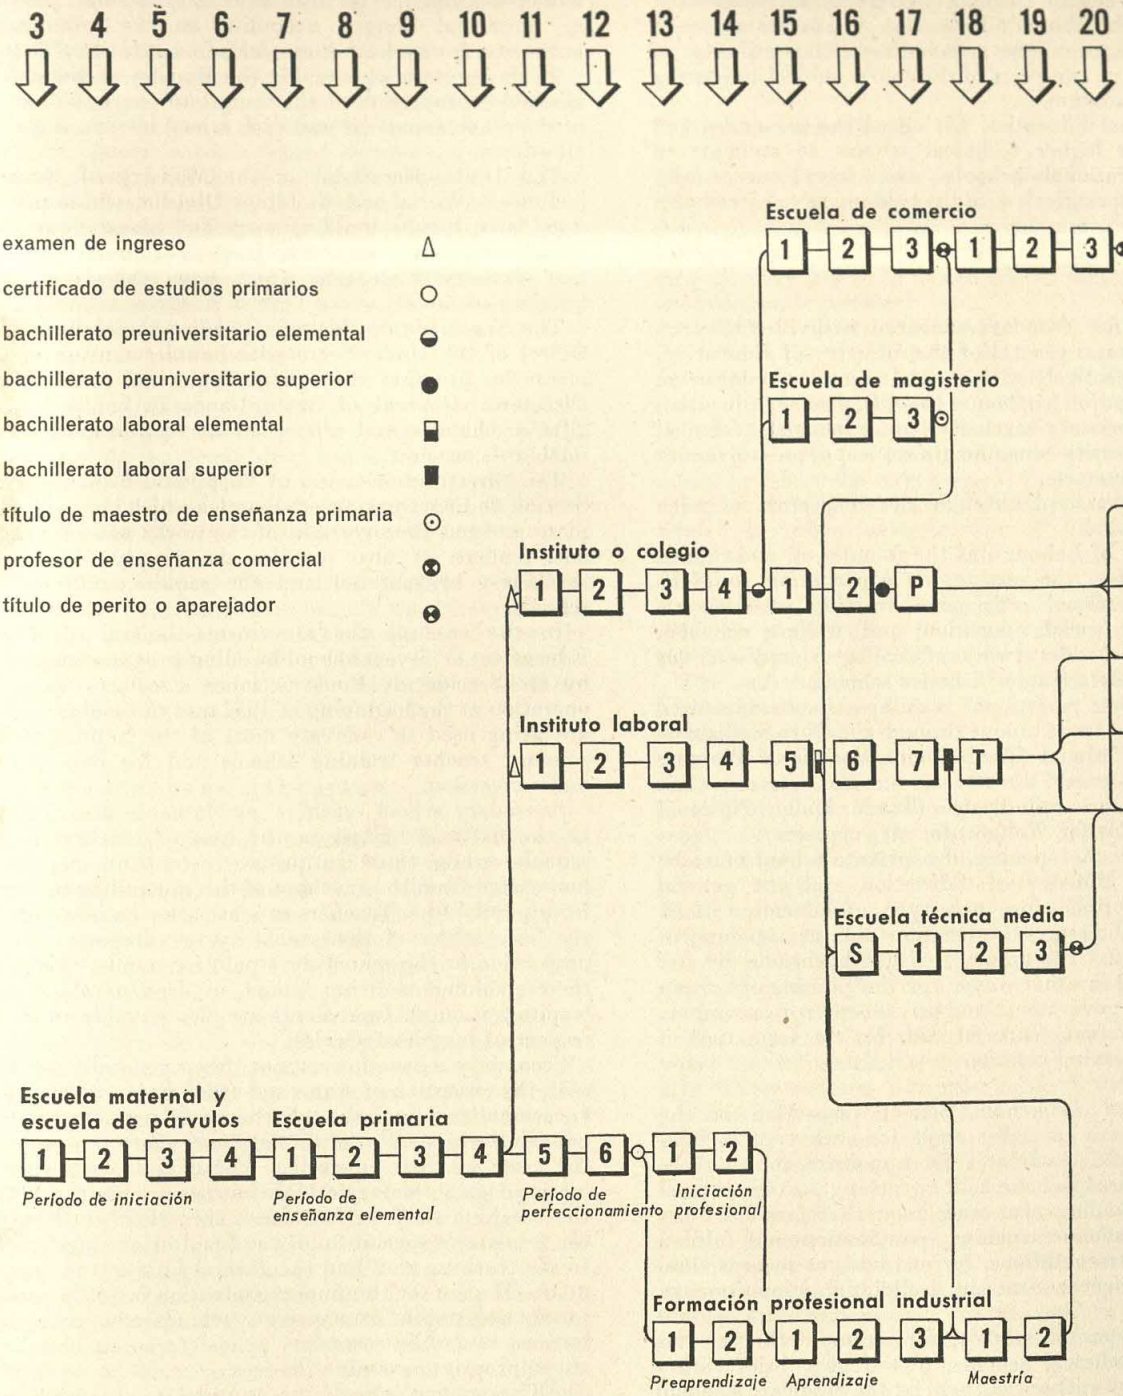
EXAMINATIONS

bachillerato laboral elemental: lower vocational secondary certificate.

bachillerato laboral superior: upper vocational secondary certificate.

bachillerato preuniversitario elemental: lower general secondary certificate.

bachillerato preuniversitario superior: upper general secondary certificate, the basic qualification for university entrance.



certificado de estudios primarios: primary school certificate.

examen de ingreso: entrance examination.

título de maestro de enseñanza primaria: qualification as primary teacher.

título de perito o aparejador: qualification as technician or technical overseer.

título de profesor de enseñanza comercial: qualification as commercial teachers.

The Primary School Leaving Certificate introduced by Article 42 of the Primary Education Act makes access to secondary education easy, including the possibility of 'jumping' one or two years of the course subject to passing a simple examination.

The Technical Education Act opens the secondary and ultimately the higher technical schools to students in industrial vocational schools who have successfully followed the apprentice's with the tradesman's or foreman's course as the case may be.

Administration

Responsibility for secondary education is divided between several directorates-general of the Ministry of Education, which deal respectively with general secondary education, vocational education (*enseñanza laboral*), primary education (in respect of primary teacher training schools), technical education, university education (in respect of pre-university courses), and fine arts.

Control is exercised through the inspectors of each directorate-general.

The Ministry of Labour was the founder of, and retains responsibility for, the *escuelas de capacitación social de trabajadores* (workers' citizenship training schools), *escuelas sociales* (social education and welfare schools), *universidades laborales* (workers' colleges) and *escuelas elementales de pesca* (junior fisheries schools).

There are some vocational training schools subsidized by the combined trade unions through the Obra Sindical de Formación Profesional (Trade Union Vocational Training Service); they come directly under the Vicesecretaría Nacional de Obras Sindicales (Trade Union National Under-Secretariat for Welfare) for all purposes.

Authority for the opening of a private school must be given by the Ministry of Education and the general standards prescribed for each type of education must be met. The Ministry of Education aids the opening of private schools by the grant of cash subventions, by tax exemptions and in other ways. For the running of certain types of school, government and private enterprise combine forces for a common cultural end, by the formation of *patronatos* (governing boards).

Supervision and inspection. School inspection is the responsibility of a specialist corps for each type of education. As a rule, candidates for appointments to these bodies are required to have held a teaching post in a school of the corresponding type and must therefore hold the appropriate academic teaching qualification and fulfil a number of other conditions, for instance, as regards total teaching experience, time in individual appointments, etc.

For some types of schools, for example the *escuelas sociales* and technical schools, a watching brief rather than supervisory authority is held by the Sindicato Español Universitario, in pursuance of which it appoints a student representative on the Staff Council who has a right of audience but no vote.

In some secondary schools parents' assocations have been formed which co-operate effectively with the school administrations.

Finance. Funds are derived from the national, provincial or municipal budget, according to the administering authority, from school dues, and from educational charities.

Each directorate-general in the Ministry of Education is allotted a proportion of the budget to cover the expenses of the schools under it and each school in turn is given an allocation.

The Under-Secretariat of the Ministry of Education includes a Works and Buildings Division whose principal duty is to handle building work and plant requirements for all directorates-general except Vocational Education and Primary Education which have their own school building sections.

The Negociado de Régimen Jurídico Inmobiliario (Land Office) of the Under-Secretariat handles renting arrangements for premises throughout Spain and deals with the Directorate-General of State Lands in connexion with gifts, exchanges and alienation of real property on its ministry's account.

The Directorate-General of Vocational Education has a Sección de Construcciones Laborales which checks building plans and has the oversight of the works and of contracts and tenders. It also handles the supply of furniture, machinery or material and the requirements for farm schools.

In the case of the Directorate-General of Primary Education, a 15-year school building programme prepared by its Sección de Construcciones Escolares came into operation at the beginning of 1957 and the ordinary credits are being used to renovate most of the buildings of the primary teacher training schools and for improvements and conversion.

Secondary school teachers' emoluments are chargeable to the national budget in the case of teachers in state schools, while those in private establishments are remunerated from the revenues of the controlling bodies and from pupils' fees. Teachers in state schools, in addition to the base salary of their seniority or category, receive a proportion of the school dues paid by pupils, this part of their emoluments being known as *derechos obvencionales* (capitation dues). Increments are also payable to them in respect of length of service.

Secondary education is not free, generally speaking, with the exception of state- and trade union-run industrial vocational training, though the sums payable by pupils are relatively small and do not cover more than a part of the costs of their education. The examination fees paid by pupils in secondary establishments are divided between the teaching staff welfare fund, the school welfare fund, the ministry's special fund, the 'capitation dues' payable to the teaching staff and the general fund of the establishment. The fee for the final examination is 160 pesetas per pupil, and pupils from private schools who take examinations in public secondary schools are required to pay the appropriate examination fees.

All secondary schools are required to set aside a proportion of free places equivalent to between 5 and 12 per cent of the numbers in the school. Boarding establishments are required to grant prescribed numbers of free places with full and half board.

The most important form of student aid is bursaries, which may be either at full or half rate, while another is

the grant of annual subventions for group educational travel.

The Trade Union Organization likewise grants over 15,000 annual studentships, mostly for secondary education of all types, for which further large sums in grants are provided by the youth organization Frente de Juventudes. The students in the workers' colleges are mostly in receipt of grants from the *mutualidades laborales* (workers' friendly societies). And all students in the establishments of the Obra Sindical de Formación Profesional (Trade Union Vocational Training) receive instruction free of all charges, free board or half board in boarding establishments and coverage under specified welfare heads. In some instances grants are made by individual corporations, societies or firms for their own nominees.

Buildings and equipment. The buildings used for secondary education are to a great extent new and provided with all the requisites for maximum effectiveness and serviceability. Old buildings not capable of conversion in conformity with modern educational needs are being replaced by new ones which meet the most exacting requirements.

School welfare services. The school medical service is responsible for watching over pupils' health and some schools have a clinic. In the general secondary sector, the adjustment and mental health problems of baccalaureate candidates are dealt with by the Psychotechnical Guidance Service (Servicio de Orientación Psicotécnica).

TYPES OF SECONDARY EDUCATION

Pupils completing primary education have the following choices open to them: (a) immediate entry into the labour market (they must have passed their 14th birthday and hold the primary school leaving certificate); (b) study at secondary level in industrial vocational training centres, where they can secure the ratings of craftsman and foreman and go on into employment or to technical schools at secondary level; (c) take the pre-university baccalaureate (lower and upper) or the vocational baccalaureate (lower and upper), which qualifies them for admission to the higher technical schools; (d) take commercial education leading to the qualification of commercial technician; (e) take teacher training for appointments in primary schools; (f) study fine arts—music, painting sculpture, etc.; (g) enter upon other forms of specialized training such as courses for public health technicians, linguists, etc.

The Educational Guidance Department of the Instituto Nacional de Psicología Aplicada y Psicotecnía (National Institute of Applied Psychology and Psychotechnology) and the branch offices of the institute to be found in almost all provincial capitals advise students and their parents on the type of secondary studies most suitable for each individual. In addition to its psychiatric functions already mentioned, the Psychotechnical Guidance Service helps baccalaureate students in the selection of courses and jobs.

The secondary school year runs from 1 October to 15 June and is usually divided into three terms. Vacations are taken at Christmas (20 December to 7 January), Easter (7 days) and in summer (16 June to 30 September). Schools are usually open 6 days a week, the hours of class varying according to the type of school. Instruction may be full-time, half-time (morning or afternoon) or on a night school basis.

General secondary schools

These schools (*centros de enseñanza media, institutos, colegios*) prepare pupils for the baccalaureate. The course does not qualify them for a specific vocation but gives a thorough general education which will improve the student's chances of success when he embarks on university education or professional training.

Candidates must have reached their tenth birthday in the year of entry and must pass an entrance examination on subjects taught at the primary level. Exemption from this examination is granted to those in possession of the primary school leaving certificate, those who received their primary education in the preparatory school of a secondary school or those who have passed the entrance examination to an *instituto de enseñanza laboral* (vocational secondary school) or other establishment of the same or higher level.

Curriculum. The governing considerations are the inculcation of spiritual values, the training of character and the development of mind and body.

The total number of yearly subject courses under the new baccalaureate curriculum is 35, against 48 under the 1953 curriculum.

In the lower baccalaureate course, which lasts 4 years, the following subjects are taken. *First year:* Spanish, 6 periods per week; Spanish geography, 6; mathematics, 6; religious instruction, 2; drawing, 3. *Second year:* Spanish, 6 periods a week; world geography, 4; mathematics, 3; a modern language, 6; religious instruction, 2; drawing, 2. *Third year:* Latin, 6 periods a week; mathematics, 3; natural science, 6; a modern language, 4; religious instruction, 2; drawing, 2. *Fourth year:* Latin, 3 periods a week; Spanish, 3; history, 6; mathematics, 3; physics and chemistry, 6; religious instruction, 2.

The upper or university baccalaureate course lasts 2 years, and is organized in two parallel sections, science and arts. These sections comprise subjects common to both, which are taken by all pupils, and special subjects for each. *Fifth year:* common subjects—natural science, a modern language (the same as in the lower baccalaureate), religious instruction and drawing. Special subjects—mathematics and chemistry for the science section and Greek and Latin for the literature section. *Sixth year:* Common subjects—philosophy, Spanish language and literature, history of art and culture and religious instruction. Special subjects—mathematics and physics for the science section; Greek and Latin for the literature section. Common to all annual courses are the development of patriotic feeling and physical training, plus domestic economy for girls.

Achievement testing. Baccalaureate students are marked separately in each subject. The annual examinations take place at the end of the academic year out of term time in September. Markings are from 1 to 10, 5 marks being necessary for a pass. The gradings are 'held back' (1 to

4 marks), pass (5 to 6 marks), distinguished (7 to 8 marks) and outstanding (9 to 10 marks).

Pre-university course. Holders of the upper baccalaureate wishing to go on to a university are required to pass the pre-university course as a preliminary. It is 9 months in length, and consists of specific subjects notified yearly by the Ministry of Education. Attendance at a recognized establishment is compulsory, and on completion the centre where the course has been taken issues a proficiency or attendance certificate to enable the candidate to sit the qualifying examinations in June and September.

Teaching staff. Teachers in academic secondary education may be state employed or free (private). State employed teachers are those who have passed the prescribed academic eliminatory and professional tests and are employed in state or municipal secondary schools, with the rights, restrictions and responsibilities of civil servants. They consist of: (a) staff teachers (*catedráticos numerarios*), who must hold the licentiate of a university faculty of arts or science, except for drawing masters who must be graduates of the Escuela Superior de Bellas Artes; (b) special subject teachers, appointed to take modern language classes, art classes, handicrafts and all subjects for which a university degree is not necessary; (c) associate teachers (*profesores adjuntos*), licentiates in science or arts who assist the staff teachers, act for them in split classes, during their absence or during the vacancy of a post, and co-operate in teaching and educational duties; they are remunerated from state funds; (d) assistant teachers (*profesores ayudantes*), university, etc. graduates who assist with classroom exercises and are remunerated from the revenues of the school where they are employed.

To improve the standards of scholarship and training in the profession, an Escuela de Formación del Profesorado de Enseñanza Media (Secondary Teachers' Training School) was established by an Order of 19 July 1955 under the Centro de Orientación Didáctica (Didactical Guidance Centre). The latter was instituted by Ministerial Order of 27 December 1954 and its responsibilities include the purchase and keeping of publications.

Staff and associate teachers are recruited by competitive examination. Special subject teachers may be appointed by competitive examination or at the discretion of the appropriate authority. Assistant teachers are selected on qualifications and at the discretion of the authorities.

Types of secondary schools. Secondary schools may be classified according to the way in which they are financed or administered, and their manner of operation, as follows:

State institutes (*institutos nacionales*). Since the academic year 1957–58 state institutes have had branch schools located in suburban areas. There is also provision for night courses in the institutes.

Unofficial schools. Unofficial secondary schools may be licensed (*autorizados*) or recognized (*reconocidos*) according to their academic standing. The standards prescribed as conditions for the recognition of unofficial schools are in no case higher than those applicable to state schools of the same level. Teachers must hold the academic qualifications required by law.

Church secondary schools. As well as being subject to the supervision and jurisdiction of the church hierarchy, these schools are organized, maintained and controlled by it or by canonically approved teaching institutions.

Foundation schools (*centros de patronato*). These are, firstly, schools in whose operation and management the State co-operates with other public corporations, with ecclesiastical bodies, with Falangist bodies or with private corporations under legally established statutes and agreements, and secondly, schools conceded the status in virtue of the charitable service they perform in providing education for necessitous pupils, on condition that they maintain a satisfactory standard of teaching.

Private secondary schools. This term covers schools founded by private enterprise which are neither church nor *patronato* schools but conform to the education laws in respect of curricula, teaching standards, tests and inspection and offer junior or senior secondary education on a private basis.

There are also the 'independent' schools whose students must requalify in the subject examinations and finals before the Examining Boards of the State Institutes of Secondary Education, when permission may be given, in specified circumstances, to count time spent in an independent school.

Correspondence schools. Private correspondence schools are governed by the Decree of 17 June 1955 supplemented by the Ministry of Education Order of 11 July of the same year.

Vocational secondary schools

Vocational secondary education (*enseñanza laboral*), which contains general education and vocational training features, is a new pattern of education given in *institutos laborales.* The lower stage (*bachillerato laboral elemental*) is comparable to the first part of the general baccalaureate as regards the basic formative disciplines, supplemented by initial 'trade' instruction in the practical aspects of agriculture, industry, office work and similar activities for those students unable to secure such training by other means.

These centres are used by three classes of student: those who only want practical training in modern trade subjects with a lower baccalaureate foundation of general education; those aiming at going on to other specialist and technical studies for which the lower baccalaureate is a sufficient qualification; and finally the more gifted, intellectually, living at a distance from large urban centres who can thus take the lower baccalaureate near their homes with the intention of pursuing their studies later and passing the university baccalaureate by a system of equivalences and additional subjects.

Vocational secondary schools are opened as national technological needs dictate; the branches of specialization they cover include arable farming, animal husbandry, industry, mining, seafaring, administration and women's employments, the nature of the courses offered in a particular school being influenced by the economic pattern of the region in which it is situated.

These schools may be opened by the State or privately.

The state schools are established by the Ministry of Education in association with *municipios* (local councils), *diputaciones provinciales* (provincial councils) or other public entities, Falange services and any other individual or corporation desirous of contributing to their foundation. Non-governmental vocational secondary schools may be given state subventions in proportion to the number of free places they offer and will be gazetted as establishments of public service. They are subject to state inspection.

To take overall responsibility for the organization and functioning of this branch of education, a *Patronato Nacional* was established, with the Under-Secretary of the Ministry of Education as chairman, and representatives of all the interests playing a part in the schools' activities.

There is an entrance examination from which are exempted those candidates who hold a primary school leaving certificate or who have passed the entrance examination to another secondary school. Other examinations are annual tests for each subject and a final examination consisting of a theoretical and a practical part.

A specimen time-table for the lower (5-year) stage of a vocational secondary school of agriculture (arable and livestock farming) is given in the table opposite.

The upper vocational baccalaureate stage (*bachillerato laboral superior*) is a 2-year course of study which similarly comprises some subjects common to all specialist courses and others exclusive to each. By way of example the time-table for the farm pests specialist course is given below.

TIME-TABLE FOR VOCATIONAL SECONDARY SCHOOL OF AGRICULTURE (UPPER STAGE)

(in hours per week)

Subject	Year	
	1	2
Languages		
Spanish	1	1
French	1	1
Geography and history		
Economic geography	1	–
History of agriculture and animal husbandry	1	–
Applied economic geography	–	1
Mathematics	1	1
Physics and chemistry		
General and applied physics (theory and practice)	3	3

Total	31	$34\frac{1}{2}$	$40\frac{1}{2}$	$40\frac{1}{2}$	$40\frac{1}{2}$

Women take the vocational secondary baccalaureate course in centres of vocational secondary education where girls' classes have been started, and will be able to do so in such all-female schools, public and private, as may be established in future years at the instance of the Ministry of Education.

Teaching staff. Teachers in vocational secondary schools must be licentiates of the appropriate faculty, as in the case of science and arts subjects, and, for the technical subjects, either hold a corresponding degree of another university

faculty or be graduates of a senior or professional technical school or similar institution. They are appointed on the results of a competitive examination or on the reasoned recommendation of the *patronato* concerned. In the former case, successful candidates obtain the status of civil servants, with permanence of tenure and other rights attaching thereto; appointment by recommendation is for a period of five years, and renewable.

Teachers in private schools are appointed at the discretion of the school itself subject to their holding qualifications equal to those laid down for teaching staff in state establishments.

The Institución de Formación del Profesorado de Enseñanza Laboral (Teacher Training Institute for Vocational Secondary Education) was formed under the Ministry of Education by a Decree of 14 March 1952. Its commitments include the further training of temporary teachers in vocational secondary schools, the training of candidates for teaching posts (for the easier selection of appointees); and, outside the teaching sphere, giving opinions on pedagogical and technical questions put by the Patronato Nacional and the centres of vocational secondary education. The staff of the institute comprises two classes of instructor: teachers of general subjects whose duty it is, with the help of their assistants, to take the basic subjects and direct students' training in their particular fields; and specialist associates whose duty it is to run the laboratories and workshops in their branches, carry on regular research and give practical instruction in their special subject in such teaching periods as may be set aside for it by agreement with the instructor in charge. All teachers must be graduates of a university or of a special school at university level.

Industrial vocational training schools

Industrial vocational training is governed by the Law of 20 July 1955 whose immediate predecessors were the Vocational Training Statute of 21 December 1928 and the Industrial Education Statute of 31 October 1924. Its essential aim is to provide a satisfactory qualifying training for operatives in the various types of industrial work. The main responsibilities of the Ministry of Education in this matter are approving schemes of instruction, prescribing the conditions and requirements for the establishment, licensing and official recognition of such training courses and carrying out the official inspectoral functions prescribed by law in centres in this category.

Industrial vocational training comprises apprenticeship from 14 to 17 and tradesman and foreman training from 17 to 21.

Apprenticeship studies are taken in the *escuelas oficiales de orientación profesional y aprendizaje* (aptitude testing and apprentice training schools) and equivalent private schools, while the foreman courses (*maestría*), where tradesmen and foremen are trained for industry, are given in the *escuelas oficiales de trabajo* or the *escuelas de maestría industrial* or in non-government centres; the latter may be recognized or licensed church centres, trade union schools, or recognized or licensed schools started by private interests, notably those which major industrial undertakings are required by law to establish.

Studies may be on a full-time, part-time or extension basis.

When attendance is full-time, the apprentice or tradesman takes the whole syllabus exclusively in the school and its attached workshops and laboratories; as far as possible instruction takes place in normal working hours and is planned intensively to give operatives a technical training in the shortest possible time. In part-time training, the arrangement is for the employee to do a maximum of 34 hours per week in his place of employment and have the remainder of the working week for attendance at the instructional centre or the course where he has enrolled. Under 'extension' arrangements, the tradesman or foreman is employed by his firm on normal terms, can do a full day's work and still attend the appropriate school or free course for the required instruction to bring his knowledge up to the standard for the professional certificate he seeks.

Escuelas de aprendizaje industrial (industrial apprentice schools). The minimum age for entry is 14 and candidates must hold the primary school leaving certificate, undergo a psychotechnical examination and take qualifying tests, holders of the lower baccalaureate being exempt. Instruction is free in state centres.

Apprentice training consists of three consecutive courses of theoretical and practical instruction in fundamental scientific and technological knowledge and in the graphic and manual skills essential to apprentices in the basic groups of industrial employments and for the range of specialist trades in each.

Apprentice training is full-time in the first academic year and may be full-time or part-time in the other two. On completion of the first year's studies, students take a number of tests for the award of the certificate qualifying them as *aprendiz en prácticas* (entered apprentice) which, other things being equal, gives holders preference for employment by industrial undertakings.

Escuelas de maestría industrial (industrial foreman schools). The minimum age for entry is 17 and candidates must be in possession of one of the following qualifications or certificates: entered apprentice, vocational baccalaureate, certificated apprentice, or class 3 or equivalent craftsman.

All candidates undergo psychological testing, and some categories are required to take an entrance examination in addition. The full course lasts 4 years, of which the first 2 turn out skilled operatives for the basic employments and specialized trades covered by the particular centre, while the last 2 produce foremen.

On completion of the first 2 years, students receive the certificate of *oficial industrial en prácticas* (qualified tradesman). On completing the final course they receive the certificate of *maestro industrial en prácticas* (qualified foreman). This gives them priority for employment in industrial undertakings. On completion of 2 years' experience in their industry, they can sit an examination for the diploma of *maestro industrial titulado* (certificated foreman).

Instructional staff in industrial vocational training centres consist of staff teachers and workshop supervisors, associate teachers, special subject teachers and workshop and practical training instructors.

Trade union industrial training activities. The essential object of trade union industrial training centres is to turn out operatives or tradesmen of equivalent status mainly in the metal, electrical, wood working, printing and building trades. Entry is at 12, 13 or 14 according as pupils want or do not want to take first-year apprentice training. Candidates have to pass a number of practical tests and undergo a complete psychotechnical examination.

Vocational courses coming under the Ministry of Labour

Workers' colleges (*universidades laborales*). The dispositions governing the functioning and direction of workers' colleges are the following: (a) on their teaching status, Cabinet Order of 16 August 1958; (b) on their civil status, Ministry of Labour Order of 8 December 1958; (c) on the organization of the Sección Central de Universidades Laborales (Workers' Colleges Division of the Ministry), Ministry of Labour Order of 2 January 1959.

Although workers' colleges come under the Ministry of Labour, the Ministry of Education is responsible for their educational and pedagogical guidance. For the purposes of co-ordination between the two ministries there is a Technical Council, the Consejo Técnico de Universidades Laborales, which acts as an advisory body on the instructional side.

The administration of workers' colleges is in the hands of the rector. Rectors are appointed by the Minister of Labour in consultation with the Minister of Education from distinguished personalities in the field of vocational and technical education.

Finance for the workers' colleges is a commitment of the Mutualismo Laboral (Industrial Friendly Society Movement). For this purpose 3 per cent of members' dues for the preceding year is set aside and posted to a training fund (Prestación de Acción Formativa), out of which the *mutualidades* pay all expenses including bursaries for students. In addition to those provided by the *mutualidades*, bursaries are also financed by the *diputaciones provinciales* (provincial councils) and *municipios* (local authorities).

Workers' colleges are regular student cities, with separate blocks and buildings surrounded by gardens. For the use of the student body and all attached staff, each college has a medical service fully equipped for all forms of treatment. There is also a staff store for the teachers.

The courses available in workers' colleges include those for the industrial foreman's qualification, the vocational baccalaureate, and for the qualifications of skilled farm worker and farm steward; in the near future the full range of technical secondary school courses will be available.

The subjects taught are as follows:

First year. Apprentice training (age of entry 14). Mathematics, 6 hours a week; science, 6; technology, 3; drawing, 6; workshops, 15; Spanish, 2; religious instruction, 2; physical training, 3; personality training, 4; total, 47 hours per week.

Second and third years. Industrial tradesman qualification. Mathematics, 4 hours a week; science, 4; technology (second year), 6; technology (third year), 4; Spanish (second year), 1; Spanish (third year), 2; factory safety and health precautions and industrial organization, 1; religious instruction (second year), 2; religious instruction (third year), 1; civic training and social law, 1; personality training (second year), 2; personality training (third year), 4; drawing, 6; workshop (second year), 18; workshop (third year), 20.

Fourth and fifth years. Foreman qualification. Mathematics, 3 hours a week; science, 3; technology, 3; drawing, 6; workshop, 20; Spanish, 3; religious instruction, 1; civic training and social law, 2; physical training, 1 hour; factory safety and health precautions, and industrial organization, 2 hours; personality training, 2 hours; total, 46 hours per week.

The object of the 'personality training' assignment is to achieve the full development of the student as a person and it covers every aspect of student life in the college. The methods of teaching it are by practice and by student participation in group activities which are designed to cultivate the student's powers of self-mastery and the spirit of fellowship and mutual help. Students are organized in independent self-governing associations sharing the same line of study and interests—sport, art, music, photography, choral singing, rhetoric, etc.

As regards the vocational secondary baccalaureate all the subjects for the lower and upper certificates are available.

Training for the skilled farm worker's qualification consists of a selection of courses spread over the period between the ages of 14 and 18. Students showing sufficient aptitude can take the farm manager's course under the Ministry of Agriculture standards and secure an officially recognized qualification (Decree of 7 September 1951 and Ministry of Agriculture Orders of 31 October 1953 and 12 July 1956). The minimum age for this course is 16.

Appointments to the teaching staff are by nation-wide selection made by the Consejo Técnico from graduate or certificated applicants. Workshop supervisors, drawing and language teachers are required to take a test of competence in addition.

Junior fisheries schools (*escuelas elementales de pesca*). Pupils are recruited very largely from youths on the rolls of the merchant marine and employed in fishing; the minimum age is 14. These schools serve three basic ends: training and passing fisher lads for qualification as skippers of coastal and deep water fishing craft and as motormen; providing an opportunity for general education for boys over primary school age; and, by continuance of studies, providing a connecting link between primary schooling and the senior level studies of the *escuelas medias de pesca* (fisheries middle schools) where the skipper's certificates for medium and long-range fishing craft are obtained. These are special purpose schools maintained entirely by the Instituto Social de la Marina, a dependency of the Ministry of Labour. The schools are financed from the budget of the institute.

Escuelas sociales. There are eight such schools in operation, located in Madrid, Barcelona, Granada, Oviedo, Salamanca, Valencia, Saragossa and Santiago de Compostela. To be eligible for admission applicants must have reached their 16th birthday and pass an examination, from which, however, those who can show possession of a secondary education diploma or ex-students of the Escuela de Capacitación Social de Trabajadores are exempt.

Studies are divided into three courses. *Course one:* organization of the Spanish State; Falange doctrine and political law; labour law (1); economic geography; economics and statistics. *Course two:* social history, labour law (2); social policy; welfare and social assurance; scientific organization and safety at work. *Course three:* trade union and corporation law; theory of labour law; labour disputes law; industrial hygiene and medicine; agrarian social policy.

To make attendance at these courses easier for apprentices, workers and office personnel, the classes take place from 7 to 9 p.m.

Escuela de Capacitación Social de Trabajadores. Established in Madrid by a Ministerial Order of 7 February 1942, the school has as its main object to provide workers with a training in citizenship through intensive 45-day residential courses. It has a budget from the Ministry of Labour from which students, during their courses, are paid their full daily wage rates and all other types of remuneration to which their employment entitles them, plus travel expenses.

Although the school is intended primarily for adult workers, a certain number of courses per year are set aside for giving citizenship training to apprentices. The latter's ages vary between 16 and 18 and they come from all parts of Spain, the only restriction being that all members of any one course must be of the same trade.

Technical subjects are taught by senior officials of the Ministry of Labour and general educational subjects by university faculty members and specialist instructors. All are appointed direct by the Ministry of Labour.

Schools of commerce

There are two levels of commercial studies, secondary and higher. At present there are 42 schools of commerce in operation under the Ministry of Education in which the following training courses, approved by a Decree of 16 March 1956, are given at secondary level.

Office assistant. The conditions for admission are attainment of 14th birthday and possession of the primary school leaving certificate or completion of a course of study in the preparatory school of a school of commerce. Those without these academic qualifications are required to take an entrance examination covering arithmetic, geometry and dictation. The course last 3 years.

Bank assistant. The same conditions for entry as for office assistants. Length of studies 3 years.

Merchant office assistant-interpreter. Same conditions for entry as above. Length of studies 3 years.

Commercial technician (*perito mercantil*). For acceptance applicants must hold the lower baccalaureate and pass certain additional qualifying tests; exemption from these is granted to holders of the upper baccalaureate and those who have passed the entrance examination for a centre of higher education. The course lasts 3 years.

Technical schools

The Law of 20 July 1957 on the organization of technical education arose from the growing need for technicians created by Spain's programme of industrialization. By this law all technical education is fitted into a co-ordinated and progressive system which allocates subjects appropriately between two successive stages: (a) *escuelas técnicas de grado medio* (secondary level technical schools), providing the essentially practical specialist training required for the holding of a technician's post, and conferring the rating of 'charge hand' or technician with mention of the particular trade; and (b) *escuelas técnicas superiores* (higher technical schools) providing an extensive and substantial background of science teaching followed by the specialist technological training required for professional practice as a fully fledged architect or engineer; students may get as far as the doctorate.

Admission to these schools is via selective courses which may be taken by all those with the requisite bent and an adequate level of education received alike in a general or vocational secondary school or their equivalents.

There is a joint preparatory course for admission to all secondary level technical schools which is compulsory for all holders of the lower baccalaureate and for operatives graded as class I or equivalent tradesmen with a minimum seniority as such of two years. The subjects in this course are mathematics, physics and chemistry, and candidates must pass in them within two years.

Industrial technical schools (*escuelas técnicas de peritos industriales*). Candidates for all branches of training—mechanical engineering, electrical engineering, chemical engineering and textiles—take the mathematics, physics and chemistry, natural history and drawing of the selective course in common and also the first common course, comprising elements of infinitesimal calculus and analytical geometry, general physics, general chemistry, free-hand drawing, French or English and carpentry, metal fitting and finishing, forging, casting and electrical shop training.

This curriculum will come into operation by degrees and has not yet been drafted in its entirety as the pre-1957 curriculum, which provides for two years of common studies for all branches, still applies for the classes now going through training.

First year: additional mathematics, descriptive geometry and system of projection, physics, chemistry, French or English, free-hand drawing and shop work.

Second year: additional mathematics, physics, chemistry, French or English, drawing and shop work.

On successful completion of these two courses the student can enrol in the specialist branch of his choice. By way of illustration, the curriculum for mechanical engineering technicians is given below:

First year: additional pure and applied mathematics, topography, technology, mechanical drawing, general mechanics, characteristics of industrial materials, mechanical engineering workshops.

Second year: machine assembling, industrial and labour law, elements of hydraulics and hydraulic machines, mechanical drawing, applied mechanics, mechanical workshops.

Third year: industrial health and accident prevention, works accounting and organization, political economy, elements of thermodynamics and heat engines, works and drawing office practice; mechanisms, machine tools and machine tool practice, mechanical workshops.

Agricultural technical schools (escuelas técnicas de peritos agrícolas). Conditions of entry: preparatory and selective courses as for the industrial technical schools. The curriculum under the 1957 law lays down two years of study.

Other vocational and technical schools. These include the schools for public works technicians, surveyors, telecommunications and aero-engineering technicians, schools for builders' foremen, mine deputies and ore dressing and smelting works foremen, the State Nautical School, schools of ceramics, schools for public health technicians, etc.

The educational and vocational training commitments of the *centros de enseñanza media y profesional* (vocational secondary schools) were extended by Ministerial Order of 15 June 1954 to include the provision of domestic economy courses for girls. These courses give training in homecraft, rural home industries, and elements of health knowledge and citizenship.

Arts and music schools

These include conservatories of music, schools of dramatic art (including folk dancing), and colleges of fine arts, all coming under the Ministry of Education. The two first-named provide courses at elementary, professional and advanced levels.

Teacher training schools

Teachers for primary education are trained in the official primary teacher training schools under the Ministry of Education and in non-governmental schools run by the church or such bodies as the women's section of the Falange (FET) and the trade union youth movement (JONS) and the Frente de Juventudes.

All schools have suitable premises, suitably equipped, for their teaching commitments. There are schools for men and women.

For admission to the beginners' course, candidates must be 14 years of age, hold the lower baccalaureate, be of Spanish nationality and free from any contagious disease or physical defect likely to incapacitate them for teaching (this last condition may be waived). There are entrance examinations and the full training lasts 3 years.

Staff teachers' appointments in primary teacher training schools are filled by competitive examination of holders of a science or arts degree. Candidates must produce proof of two years' teaching practice in a training school and be qualified primary school teachers or have a pass in general pedagogy and teaching methods from a university department of education.

Special subject teachers must hold a satisfactory qualification in their subject and take any tests prescribed. Graduates in philosophy and arts from the education section who desire appointment as teachers of pedagogic disciplines will be required to do one year of practical teaching in a primary school.

Out-of-class activities

Special attention is given to sports and games in secondary education and the Ministry of Education runs annual inter-school championships with eliminating rounds in each province and finals in Madrid. State, church and private schools participate and the standard of the performances is clear proof of the keenness and the sound training of the pupils.

Sports activities are mainly run by the *Frente de Juventudes* and the women's section of FET and JONS, which arrange matches, etc., both in term time and more particularly in youth hostels and summer camps.

In the hostels and camps, the schoolchildren have the benefits of healthy conditions and good companionship, do their own organizing and live their own lives. The camps are situated in the most picturesque parts of Spain.

TRENDS AND PROBLEMS

The intention is that general secondary education at the lower level shall become compulsory, though this will not be achieved overnight. A most successful step already taken in this direction has been the introduction, in the institutes, of classes for young office and factory workers to assist them in improving their education after their day's work.

By a far-reaching system of study equivalences, any student who has gone through any kind of secondary school and meets the conditions of eligibility can follow the career of his choice with no road barred to him.

It is also the intention to make secondary studies more uniform by the promulgation of a law to co-ordinate and consolidate the vast variety of categories within the same secondary grade.

STATISTICS

Population: (mid-year 1958 estimate): 29,662,000.
Area: 194,396 square miles; 503,486 square kilometres.
Population density: 153 per square mile; 59 per square kilometre.

Summary of school statistics 1953–57. Total enrolment in educational institutions at all levels from kindergartens to university was about 4,208,000 pupils in 1957/58, representing 14 per cent of the population. There were, in addition, some 365,000 people, mostly men, attending adult education courses. Of the school-going population, 9 per cent were pupils in nursery schools, 74 per cent in primary schools, nearly 10 per cent in general secondary schools, over 4 per cent in vocational schools, about 1 per cent in teacher training courses at secondary level and the remainder, less than 2 per cent, at university and higher educational colleges. Girls made up over half the enrolment at primary schools, 39 per cent in general secondary, 27 per cent at vocational schools, 56 per cent at teacher training courses and 16 per cent at universities and higher educational institutions. The teaching staff at all levels of education, excluding special schools and adult education, was over 127,000 in 1957/58, an increase of 10 per cent compared with 1953/54. Women teachers were 60 per cent of the total in public primary schools, 36 per cent in all general secondary schools, nearly half the staff at teacher training courses, and 8 per cent at university level institutions. These percentages show little change compared with 1953/54. The pupil-teacher ratio in primary schools in 1957/58 was 38 compared with over 40 in 1953/54 but in general secondary schools 21 against 15 at the beginning of the period under review. Compared with 1953/54, however, enrolment increased by nearly 60 per cent in general secondary education. At other levels of education enrolment rose more moderately between 1953/54 and 1957/58: by 3 per cent in primary schools, by 16 per cent at secondary vocational schools, by 52 per cent at teacher training colleges and by 9 per cent at universities and higher educational institutions. (See Table 1.)

Enrolment trends in secondary education, 1930–57. Enrolment in general secondary education increased more than five-fold between 1930 and 1957 and over the same period the proportion of girls to total enrolment rose from 15 to 39 per cent. Expansion of vocational education was less striking but enrolment in 1957 was three times as high as in 1930. The trend in public teacher training schools has fluctuated over the period under review but enrolment appears to have been increasing more rapidly in recent years; women now represent well over half the enrolment in these schools. The ratio of enrolment in all sectors of secondary education to the estimated age group 15–19 years has steadily risen from 7 in 1935 to 21 for the 3-year period 1955–57. (See Table 2.)

Examination results in secondary education, 1953–57. The number of students awarded the elementary *bachillerato* or lower secondary school certificate increased by 145 per cent over the 5 years under review and the proportion of girl candidates rose from one-third to 42 per cent of the total. Candidates awarded the upper *bachillerato* or higher secondary school certificate increased by 46 per cent between 1953/54 and 1957/58 but on the other hand the proportion of girls declined slightly. Certificates granted by technical, industrial and commercial schools numbered 8,811 in 1957/58 against 9,142 in 1953/54—the fall in the number of students taking the upper commercial certificate (*profesor mercantil*) was largely responsible for this decline. Teaching certificates steadily increased from 5,266 to 6,577 over the period, representing a rise of 24 per cent; three-quarters of the teaching certificates were awarded to women students. (See Table 3.)

Educational finance, 1957. Total expenditure by the Ministry of Education amounted to 3,156 million pesetas in 1957 (fiscal year beginning January), averaging 107 pesetas per inhabitant. Of this sum, about one-third was for capital expenditure and debt repayments. (See Table 4.)

1. Official exchange rate: 100 pesetas = 2.38 U.S. dollars.
2. Budget estimate of the Ministry of Education only.
3. In addition, other Ministries allocated 168,250,207 pesetas and local authorities allocated 415,442,000 pesetas (of which 243,619,003 pesetas were for construction of primary schools).

SPANISH TERRITORIES IN AFRICA

The territories under Spanish jurisdiction may be classed as follows:

Spanish Guinea, comprising continental Guinea and a group of islands—Fernando Po, Elobey, Annobon, Corisco and some smaller ones. It is administered by a Governor-General. The Treaty of Paris of 1900 fixed the limits of the territory.

Spanish West Africa, comprising Sidi Ifni and the two adjacent regions of Saguia Hamra and Rio de Oro (forming Spanish Sahara). Administration is in the hands of two sub-governors who come under the Governor-General.

The legal basis of education in the Spanish territories embodies the following principles: (a) a juridical status broadly similar to that of provinces on the Spanish mainland; (b) special assistance to these underdeveloped regions to enable them to play a larger part in civilization; (c) respect for races and religions; (d) respect for customs.

[*Text prepared by the Unesco Secretariat in June 1960.*]

STATISTICS: SPANISH GUINEA

Population (mid-year 1958 estimate): 214,000.
Area: 10,831 square miles; 28,051 square kilometres.
Population density: 20 per square mile; 8 per square kilometre.

Summary of school statistics, 1953–57. In 1957, enrolment in primary and secondary schools numbered 21,867 pupils, representing about 10 per cent of the estimated population. The number of girls attending schools is unknown. Of total enrolment, 98 per cent were pupils in primary schools, 1 per cent in middle schools and the remainder were either in the higher school for natives which prepares assistant teachers and government employees and/or in two other vocational schools. No information on adult edcuation is available for recent years. In 1953, it was reported that 378 people, of whom 91 women, were attending adult

education courses. Compared with 1953, enrolment in primary and secondary education increased by 19 per cent. (See table.)

Educational finance, 1958. The budget estimate for educational expenditure for the year 1958 (fiscal year beginning January) amounted to 6,464,000 pesetas, averaging about 30 pesetas per inhabitant. Official exchange rate: 100 pesetas = 2.38 U.S. dollars.

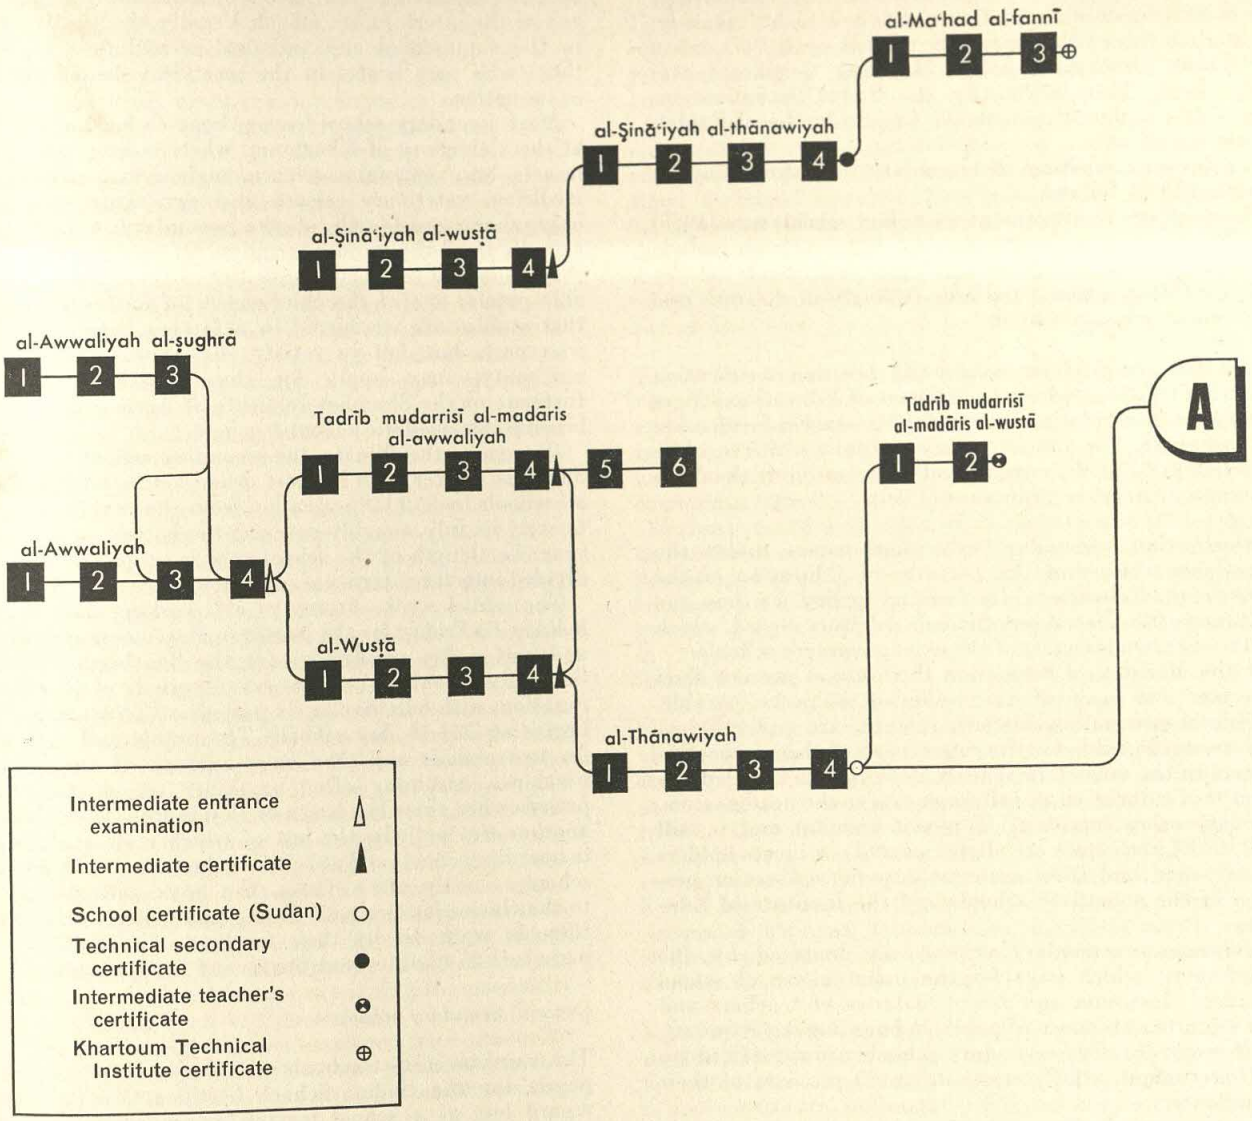
SUDAN

THE EDUCATIONAL SYSTEM

Prior to the Anglo-Egyptian Condominium (1899–1956) education was mainly religious. The Khalwa (Koranic School) and the Masjid (Mosque) were the seats of traditional learning, and were at the same time the centres of village life; the Feki (teacher of the Koran) and the 'Alim (teacher of Islamic law) were held in great respect.

This religious education continues to thrive side by side with the public educational system, but has undergone considerable change. It has thrown open its doors to current educational thought and practice, and now includes in its curriculum many modern subjects such as mathematics, science, history and geography. Further, plans are under way for orienting the whole field of religious education towards the university. The elementary school of the (secular) educational ladder leads to both the secular intermediate and secondary schools and the religious intermediate and secondary schools.

The public educational ladder. The public educational ladder, comprising the three stages of elementary, intermediate and secondary schooling (4+4+4), and leading to the university, is a creation of the Condominium era. Early attempts at secular schools were made during the Turko-Egyptian period (1821–85), but these were short-lived, and only religious education was provided during the Mahdiyya (1885–99). By about 1924 the present educational organization had more or less taken shape. Expansion, however, was comparatively slow; by 1936 the educational system had 1 secondary school, 11 intermediate schools and some 87 elementary schools, with a total attendance of only 9,000 pupils. The inauguration of the Graduates' General Congress (a private body) marked a step forward. Voluntary contributions helped in increasing the number of schools and, before the close of the Condominium rule in 1956, private enterprise had established 3 secondary schools and about 40 intermediate schools. The corresponding figures for government institutions were 9 secondary and about 50 intermediate. In girls' education progress has been slower; private enterprise did not interest itself equally in this field.



The present structure of the public educational system is shown in the diagram on page 1033. Teaching is in Arabic in the elementary and intermediate school. English is introduced as a foreign language in the first intermediate year and becomes the language of instruction in the secondary school.

Intermediate schools are of two types—academic and technical—and passage from elementary to intermediate school is by competitive examination. In 1959, 22 per cent of the boys and 12 per cent of the girls sitting the examination found places in the academic intermediate schools; a small extra proportion obtained admission to the technical intermediate schools. Passage from the intermediate level to the secondary is also by selective examination, and of 4,929 boys who sat the examination in 1959, 3,049 or 619.9 per cent passed, 1,330 or 27 per cent entered government secondary schools, and 345 were admitted to the teacher training institutes and fee-charging private secondary schools, thus bringing the total number admitted to post-intermediate education to 1,675 boys, or 34 per cent of the final intermediate class population. Of the 800 girls who sat for the final intermediate school examination, 432 or 54 per cent passed and 130 or 16.2 per cent were admitted to government secondary schools, 70 entered private secondary schools and 60 entered teacher training institutes—making a total of 260 out of 800 or about 33.5 per cent.

THE DEVELOPMENT OF SECONDARY EDUCATION

Secondary education of a professional (or strictly speaking, vocational) type began in the Sudan with the opening of the Gordon Memorial College at Khartoum, in 1902. In its earliest stage the college supported an industrial school, two higher primary schools and a small teacher training centre. Many of the boys admitted to the college in 1903 had received some schooling when a secondary division was started two years later. The college then comprised four sections—the primary school, a training college for teachers and Kadis (Islamic judges), the instructional workshop, and the secondary or upper school. A military school was opened in 1905 and affiliated to the college. The object of the college was to turn out teachers, Islamic judges, clerks, accountants, artisans, etc. When World War I came to an end in 1918, the college was still an educational 'maid of all work' and had only a small secondary division. Thereafter the increased demand for well-trained clerical and technical personnel to man the Civil Service, coupled with the expansion of the educational system generally, enabled the secondary section to grow rapidly. In 1924, it was decided to make the college a full-time secondary institution, and by 1930 it was educating 555 boys at the secondary level. Its curriculum provided 2 years' education in general subjects, followed by a further 2 years devoted largely to vocational training—engineering and surveying, teaching, accountancy, clerical work, science and Islamic law.

The Gordon Memorial College dropped its vocational bias and became a secondary school properly so-called after the De La Warr Commission visited the Sudan in 1937. That commission envisaged the rapid expansion of secondary and intermediate education and the establishment of a university college. In 1939, with the adoption of the commission's recommendation, the Gordon College began to prepare pupils for the Cambridge Local Syndicate School Certificate examination. After World War II a 10-year educational development programme was drawn up, and

GLOSSARY

al-awwaliyah (elementary school): complete lower primary school.
al-awwaliyah al-sughrā (sub-grade elementary school): incomplete lower primary school.
al-ma'had al-fannī (technical institute): college of engineering and technology.
al-ṣinā'iyah al-thānawiyah (technical secondary school): vocational secondary school.
al-ṣinā'iyah al-wusṭā (technical intermediate school): lower secondary schoo with vocational bias.
al-thānawiyah: general secondary school.
al-wusṭā (intermediate school): lower secondary school.
tadrīb mudarrisī al-madāris al-awwaliyah: teacher training school for teachers in elementary schools.
tadrīb mudarrisī al-madāris al-wusṭā: teacher training college for teachers in intermediate schools.

HIGHER EDUCATION

A. University of Khartoum, comprising faculties of agriculture, arts, engineering, law, medicine, science, veterinary medicine. There is also a school of pharmacy which comes under the Ministry of Health and is not part of the university.

more secondary schools were opened. The Cambridge School Certificate examination continued to be taken by the final classes of the secondary schools until 1951, when the Sudan Secondary School Leaving Certificate was inaugurated. This is run by the Sudan Examinations Council in collaboration with the Cambridge Local Examinations Syndicate.

The present position of secondary education may be summarized as follows.

The number of government secondary schools now (1959) total 15, 13 for boys and 2 for girls. Other schools include 6 Sudanese National Schools, 3 Egyptian schools run by voluntary bodies, and 3 Catholic, 1 Anglican, 1 Greek and 2 American mission schools.

Legal basis. The ultimate control and direction of education in the Sudan is vested in the Minister of Education. There are no laws or regulations governing the stages of education in the country. The only detailed set of rules which regulate one whole field of the educational organization is the Non-Government Schools Ordinance (1950).

Administration. Secondary education comes under the general supervision of the Director of Education of the Ministry of Education. In framing policy he has the assistance of the Secondary Schools Advisory Board, which includes the headmasters of the chief secondary schools.

At the Ministry of Education there are at present chief inspectors for each of the following subjects: Arabic, English, mathematics, history, science, art and religion. They are responsible for the supervision of their respective subjects in the secondary schools, reporting to the Deputy-Director of Education and through him to the headmasters. This inspection service is of recent creation and is still small. Chief inspectors are all degree and certificate holders and are recruited from amongst experienced senior personnel of the secondary schools and the Institute of Education.

Government secondary schools are financed by the Government, which pays for the maintenance of school buildings, classroom equipment, salaries of teachers and other staff, maintenance of pupils in boarding departments, etc. Non-government secondary schools are subsidized by the Government, which meets up to 40 per cent of their expenditure.

Government secondary schools and subsidized secondary schools charge fees, scaled to the income of the parents, the maximum being £S.30 a year for a boarder and £S.15 for a day-pupil. Private schools charge up to £S.80. The real cost of government secondary education is estimated as follows: boy (boarder) £S.117; boy (day) £S.81; girl (boarder) £S.154; girl (day) £S.103.

TYPES OF SECONDARY EDUCATION

The main type of secondary school is the academic secondary school preparing for the university but there are also a few commercial secondary schools. Technical secondary education at present comprises a stage in the Khartoum Technical Institute.

Entry to either the academic or vocational schools is by order of merit in the selective examination held at the end of the intermediate school. Usually the pupils who go to the commercial and technical secondary schools are those who pass lowest in the secondary school entrance examination.

Most secondary school leavers hope to become students at the University of Khartoum, where courses are offered in arts, law, economics, science, engineering, architecture, medicine, veterinary science and agriculture. However, only about one-fourth of the secondary school pupils actually reach the standard required for university entrance, even though a substantial number of them may be quite able pupils; one of the chief causes of failure is the fact that studies are conducted in a foreign language. Those who pass, but fail to satisfy the requirements of the university, may apply for the Khartoum Technical Institute or the Shambat Institute of Agriculture, or may become intermediate school teachers.

Because of the climate, the secondary school year in the Sudan is shorter than in most other countries, and nearly all schools have a long vacation from the middle of March to early in July, roughly covering the hottest period of the year. The length of the school year is normally 33 weeks, divided into three terms of equal length.

The school week consists of six working days, with a holiday on Friday for the Northern Provinces, and Sunday and half a day on Fridays for the Southern Provinces. Generally speaking there are seven periods of 40 minutes' duration, with only five or six periods on Thursdays. Work begins at 7.45 in day schools. The pupils and staff work for two periods and then have a break of one hour for breakfast, resuming after breakfast for another three periods when there is a break of 15 minutes. Then there are another two periods, the last of which ends at 1.35 p.m. in boarding schools and at 2 p.m. in day schools. In boarding schools, shortly after sunset, the boys and girls return to the classes for two periods of preparation, during which they do work set by their teachers. The first of these periods is 65 minutes and the second is 35 minutes.

General secondary schools

The main aim of the academic secondary school is to prepare pupils for the Sudan School Certificate, which pupils regard less as a school leaving examination than as a university entrance examination. The curriculum is largely determined by requirements for entrance to higher institutions, although there is also a substantial programme of physical education, dramatics and other activities. The development of the pupils' personality depends mainly on out-of-class activities.

Recruitment is by a competitive examination held at the end of the intermediate school course, when the pupils are 15 or 16 years old. The best candidates are admitted to government and government-subsidized schools, while those lower on the list go to private secondary schools.

Secondary schools have about 35 pupils in each class. Since all pupils take the same academic course, streaming is left until the end of their second year. At present the medium of instruction is English, but it is the intention of the Ministry of Education to substitute Arabic at an early date.

The subjects taught are Arabic, English language and literature, mathematics, science, history, geography, religion, and art and handicrafts. All these subjects are taught up to School Certificate standard and the best pupils can also study additional mathematics and science. Practical work is done only in the Art Departments—book-binding and pottery—and in the science laboratories. Physical education takes place in the mornings and games and cadet training in the afternoons.

Achievement testing varies from one school to another. In certain schools pupils sit an examination of one hour's duration every week to test their progress in a particular subject; in other schools examinations are held at the end of the first and second terms. But in all schools there is at the end of the school year in March a general examination, which is of particular importance for second year pupils since, on the basis of that examination, they are put into streams for their third year according to their attainments in the four major subjects: Arabic, English, mathematics and science.

At the end of each term the pupil's father is sent a report, with comments by the form master and the tutor of the boarding-house, on his work, diligence, behaviour, and participation in out-of-class activities. At the end of their fourth year the pupils sit the Sudan School Certificate examination in six, seven, eight or nine subjects—English, English literature, additional mathematics and additional science counting as separate subjects.

The teaching staff is mainly composed of Sudanese, but a good many expatriate teachers are also employed, the majority from Great Britain and Egypt; there are also teachers from India, Pakistan, Jordan, the Lebanon and Iraq. A number of Sudanese secondary school teachers have university degrees, either from the University of Khartoum or the University of Beirut, or Egyptian universities. Some have diplomas from the University of Khartoum or have attended training courses in Great Britain. At present there is no professional teaching course for secondary school teachers in the Sudan, but the Ministry of Education and the University of Khartoum are examining the possibility of starting a Department of Education.

Nearly all the foreign teachers employed have university degrees, some of them being honours graduates; a substantial number of them also have attended teacher training courses.

Vocational and technical schools

Commercial secondary schools. These are secondary schools with a commercial bias. They prepare boys for commercial occupations and for the Sudan School Certificate, which enables its holder to enter the university or the Khartoum Technical Institute. The subjects taught include Arabic, English, mathematics, history, geography, commerce, book-keeping, commercial arithmetic, typing and shorthand. No science or art is taught. The vocational subjects are carried to the standard of the School Certificate and are accepted by the Faculties of Arts and Economics of the University of Khartoum. Roughly one-third of the teaching time is given to vocational subjects and practice. The arrangement of the school session is the same as for the academic secondary schools.

The teaching staff includes Sudanese, British and Egyptians. Teachers of the vocational subjects are Sudanese who have graduated from Egyptian universities or have received training at the Khartoum Technical Institute and further studies at commercial institutes abroad.

Selected students with School Certificates from the commercial secondary schools proceed to the 3-year post-secondary course of the School of Commerce of the Khartoum Technical Institute. This leads to the Intermediate Examinations of the Association of Chartered and Corporate Accountants. The examination for the equivalent Ordinary Level Certificate in Commerce and the Senior Diploma of the Khartoum Technical Institute is taken at the end of the second year.

The technical course at the Khartoum Technical Institute. The Khartoum Technical Institute, opened in 1950, is responsible for technical education throughout the Sudan. It comprises the three main schools of Engineering, Commerce, and Fine and Applied Arts. It also has a Girls' Secretarial School.

Extensive and well-equipped workshops and laboratories are provided and emphasis is placed on the importance of providing a balance between practical and theoretical training. In addition to the specialized theoretical and practical subjects which form the basis, general education in English, history, geography, Arabic and religion is included in the curricula. Teaching is in English.

The School of Engineering is the largest; it is divided into the Departments of Civil Engineering and Building and the Mechanical, Electrical and Automobile Engineering. Students having passed their school-leaving examination at a technical intermediate school embark upon a 7-year course. The Ordinary National Certificate examinations, in engineering or building, and the Senior Diploma examinations of the Khartoum Technical Institute are taken in the fifth year, and the Higher National Certificate or Advanced Diploma examinations in the seventh year. Students may also sit for the School Certificate examination at the end of their fourth year.

School of Fine and Applied Arts. Two courses are offered at the institute for the training of art teachers: a 4-year course for ex-intermediate-school boys and girls, leading to the School Certificate, followed by a 3-year course ending with the Senior Diploma of the Khartoum Technical Institute. For the diploma, the students specialize in one branch of the subject, such as painting, pottery or sculpture.

Girls' Secretarial Department. Two courses were begun in 1958 at the Khartoum Technical Institute: a 2-year course training post-secondary girls to become bilingual private secretaries, and a 3-year course for post-intermediate girls enabling them to further their general education and to study Arabic and English typewriting. The two courses will lead to a Secretarial Diploma and a Typist's Certificate respectively.

Department of Further Education of the Khartoum Technical Institute. This Department is responsible for the organization of all short courses, evening classes, etc. These include various clerical and secretarial courses, recreational

art, a school certificate course, engineering and building trade courses leading to the Intermediate and Final City and Guilds of London Institute examinations. Courses leading to the corresponding Higher National Certificates in engineering and building are also available. Various evening classes are conducted at provincial centres.

Post-intermediate trade courses. These were started to enable boys having passed their intermediate school leaving examination, but not suited for academic schooling, to proceed to the Technical Institute for further education on more practical lines. There are at present three schools giving these courses and it is hoped to open two more. Engineering trade courses are offered at Atbara Technical Intermediate School and building trade courses at Omdurman and El Obied. The course is one of 5 years leading to final City and Guilds of London Institute examinations. The final 2 years of the course will be taken at the Khartoum Technical Institute.

Schools maintained by the Ministry of Agriculture and Forests. The Department of Agriculture maintains the Shambat Agricultural Institute which is post-secondary and gives a 3-year course in agriculture and animal husbandry. The Department of Forests runs similar classes for forest overseers.

Out-of-class activities

The prefectorial system, which exists in almost all schools aims at developing powers of leadership. Each boarding house in boarding schools, and each games house in day schools, has two or three prefects who are given a certain amount of authority in order to help the house tutor run the house efficiently. The head prefect of each house has a turn of being duty prefect for a week. The prefects are given other responsibilities: for example, those who serve on the food committee check the quality and the quantity of the school meals and report complaints. They also assist in the running of games and in the administration of their houses.

Sport is encouraged to keep the pupils fit and to develop the team spirit. The most popular games are football and basketball; other sporting activities are athletics, cross country running, tennis, volleyball, table tennis, and, where possible, swimming and sailing.

There are many other clubs and societies: literary and debating societies, societies for geography, history, photography, gardening, dramatic societies, scouting, etc. All boys belong to the school cadet corps and a popular feature of their training is the annual camp.

Sudanese society is religious; religion plays an important part in the daily life of the pupils and is a major foundation of character education. Almost all schools have their own mosques.

TRENDS AND PROBLEMS

With the exception of the few vocational schools, secondary schools have an academic curriculum, even although only about one-fourth of the students finally succeed in getting into the university. Perhaps about half as many again enrol in other institutions of higher education, making altogether about 40 per cent of the total. The remainder go out into life without having received adequate practical preparation. In further development the secondary school curriculum will have to be modified to provide for the non-academic pupil.

Another big problem is the shortage of secondary school places. The number of intermediate schools for boys and girls has increased and pressure on the existing secondary schools is growing. The proportion of intermediate school leavers entering the secondary schools fell sharply between 1958 and 1959, in the case of boys from 44.4 per cent to 34 per cent, and in the case of girls from 58 per cent to 33.5 per cent. Lack of funds is perhaps the greatest deterrent to the expansion of secondary education.

There is no institute for the training of secondary school teachers in the Sudan, and the university is not turning out enough students to man all departments of the Civil Service. The Ministry of Education gets its share of university graduates, but the numbers are insufficient and supplementary staff is recruited abroad, sometimes with difficulty. At present, for example, there is a shortage of teachers of English from Great Britain.

Expenditure on school buildings and the provision of boarding schools is disproportionately high. The Ministry's policy on these questions is at present under review.

The intention of the Ministry of Education to substitute Arabic for English as the medium of instruction in secondary schools will raise such problems as the preparation of Arabic textbooks, education of teachers, examinations, and the whole future of university education. A committee has reported to the Minister on the subject and the entire question is under consideration.

A Committee for Educational Planning recently spent some eight months studying the whole field of education in the Sudan, its aims and organization. Its recommendations are embodied in a report to the Minister of Education. This report is still confidential.

STATISTICS

Population (mid-year 1958 estimate): 11,037,000.
Area: 967,918 square miles; 2,505,823 square kilometres.
Population density: 11 per square mile; 4 per square kilometre.

Summary of school statistics, 1955–57. In 1957, total school enrolment was 260,000, or about 2.5 per cent of the total population. Of these pupils, 89 per cent were in primary education, 10 per cent in secondary education (including intermediate schools), and less than 0.5 per cent in higher education. The proportion of girls was 23 per cent in primary schools, 10 per cent in general secondary schools, 34 per cent in teacher training schools, and 3 per cent in higher education. There were no girls enrolled either in vocational technical schools or at the teacher training college. Women teachers represented 21 per cent of the teaching staff in primary schools, and 11 per cent in secondary schools. Between 1955 and 1957 total enrolment increased by about 50 per cent, the increase in primary schools being about 44 per cent, while secondary enrolment more than doubled. In 1957 there was an average of 46 pupils per teacher in the primary schools. (See Table 1.)

Enrolment trends in secondary education, 1931–57. Table 2 shows that between 1931 and 1953, enrolment in general secondary schools, not including intermediate schools, had multiplied seven times. Between 1955 and 1957, taking into account the intermediate schools, pupil enrolment more than doubled again. Thus the rate of growth appears extremely rapid, yet the level of enrolment, when related to the estimated population 15–19 years old is still extremely low; for the period 1955–57, this ratio is less than two.

Examination results in secondary education, 1953–57. The number of pupils obtaining the Sudan School Certificate was 246 in 1953, 340 in 1955, 434 in 1956, and 484 in 1957. In the latter year, a further 152 pupils passed the Public Service examination.

Educational finance, 1957/58. For the fiscal year beginning in July 1957, total expenditure for education amounted to 4.4 million Sudanese pounds, approximately £0.4 per inhabitant. Of this amount, 94 per cent came from the Central Government, the rest from tuition fees and from sale of school products. Salaries to teachers accounted for 51 per cent of the total expenditure. (See Table 3.)

SWEDEN

THE EDUCATIONAL SYSTEM

Regulations governing education are contained in Orders issued by the Crown and in instructions and directives drawn up by the central authorities (Board of Education and Board of Vocational Training), regional authorities (county school boards) and local authorities (school boards). In addition to public schools, private schools providing instruction for children of compulsory school age are subject to these regulations, to a certain extent, as also are schools for children over school age which receive any form of state or municipal grant.

The most important types of school for children of compulsory school age are the primary school (with a minimum of 7 compulsory years) and the comprehensive school (9 compulsory years), both of which are designed to provide instruction and training as a basis for further education. The intention is that all pupils shall get secondary education after taking a 6-year primary course. For the time being it is possible to go on to secondary school after 4 years in the primary school, but this alternative will eventually be eliminated. The 7-year primary school will gradually be replaced by the 9-year comprehensive school.

The structure of the school system is shown in the diagram on page 1041.

THE DEVELOPMENT OF SECONDARY EDUCATION

The most recent important reorganization of the upper secondary school (*gymnasium*) and lower secondary school (*realskola*) was effected by Parliament in 1927 and most of the changes introduced are still in force. In 1956 Parliament decided that a 3-year *realskola* should progressively become general for all pupils who have completed 6 years in the primary school and studied English in the 5th and 6th classes. Parallel with this school, the 4-year *realskola* was to be retained, providing a more leisurely course, whilst the 5-year lower secondary school following the 4th class in the primary school was to be gradually abolished.

The municipal lower secondary school was first introduced in 1909. About the middle of the 1930s a practical course (*praktiska realskolor*) was added, either as a separate institution with a 4-year course or as a practical stream in the two top forms of the *realskola*.

The present form of the municipal girls' school (*flickskola*) with a specially designed course was introduced. To begin with this school was a 7-year one following the 4th class in the primary school. A 6-year school was later established following the 6th class. The main form is now a 5-year girls' school following the 6th class of the primary school.

In 1950 Parliament decided on the introduction of a 9-year compulsory comprehensive school to replace gradually all other types of school for primary and lower secondary education. However, the practical type of lower secondary school and the municipal girls' school were not to be affected for the time being, as it was assumed that these could be assimilated to the comprehensive school.

The organization of the 9-year comprehensive school was to be worked out by means of extensive experimentation. This work has since been progressively intensified and as from the year 1962/63 it should lead to a general transition to the new type of school. Out of a total of 1,034 municipalities in the whole country, there were 143, representing 22.8 per cent of the total population, which had comprehensive schools in 1958/59. Special experimental upper secondary schools (*försöksgymnasium*) have been organized for students from comprehensive schools.

The folk high school is an institution that is peculiar to Scandinavia. The Swedish folk high schools came into being as a result of increased obligations concerning general social education which were placed upon municipal administrations by legislation about the middle of the nineteenth century. At the present time there are some 90 of these schools in the country.

Legal basis

Regulations concerning instruction at secondary schools are contained in the following legislation:

General Educational Statute of 23 May 1958, which sets forth instructions on the direction and administration of education in municipalities.

School Board Law of 21 December 1956.

Primary School Statute of 23 May 1958, containing directions, *inter alia*, concerning instruction in the higher stage of the comprehensive school.

Statute of 23 May 1958 on state general secondary schools throughout the country.

Statute of 23 May 1958 on municipal secondary schools (girls' schools, *realskolor* and practical *realskolor*).

Statute of 25 March 1960 concerning state-aided private secondary schools.

Folk High Schools Statute of 12 September 1958.

Administration

Central administration of the educational system is exercised mainly by the Board of Education and Board of Vocational Training which come under the Department of Education and Ecclesiastical Affairs. The Board of Education supervises all types of general education including practical lower secondary schools, folk high schools, etc. The Board of Vocational Training is concerned with vocational training as such. Regional control and administration of practically all types of schools in a county is carried out by the County School Board (*länsskolnämnden*) which also acts as a centre for the co-ordination and planning of municipal educational activities. Attached to each

County School Board are one or more school inspectors. Local administration of schools in each municipality is carried out by an elected school board (*skolstyrelse*) with full powers to deal not only with municipal schools (primary school, comprehensive school, municipal secondary schools, municipal vocational schools) but also with state secondary schools. In each municipality, under the authority of the school board, there is a superintendent of schools (*skolchef*) According to the number of schools in a municipality the superintendent may be a headmaster or a senior headmaster (who are also teachers), or, in a larger municipality, a school director.

Syllabuses for the various types of general school, applicable throughout the country, are drawn up under direct royal authority or by the Board of Education or by the Board of Vocational Training. Certain of these serve as standards for individual school syllabuses and leave room for local deviations. Instructions on methods are also issued by the boards in question but are intended merely as a guide.

Textbooks are prepared to conform to syllabuses. No textbooks may be adopted for general use except those that have been approved by the State Textbook Committee and have been incorporated in the official 'Textbook List'. Most of the committee's members are laymen but the work is also shared by educationists and other experts. Not only the contents of textbooks, but also the typography, price and general suitability must be approved.

As already mentioned, all private educational establishments attended by pupils of compulsory school age are subject to control by the educational authorities. As a rule this control is restricted to private schools receiving state grants; but there is a large number of such schools, all of which must meet certain approved standards in order to qualify for assistance.

Supervision and inspection. Central supervision of secondary schools is exercised by counsellors (inspectors), who are members of the Board of Education or the Board of Vocational Training. A number of consultants on various subjects are attached to these boards.

In the future, the County School Boards (which were set up in 1958) will also be responsible for direct inspection of secondary schools coming under their supervision. The inspection will be carried out by the county school inspectors. The aim of inspection is to obtain full information on the condition and needs of schools. The inspector must see that the regulations on the general organization of work are being complied with, observe lessons in progress, inspect premises and instructional materials, give advice to individual teachers, etc.

Some schools have parents' associations whose main object is to promote co-operation between home and school, encourage the exchange of information and advice, and work for improvements in matters relating to the education of children and adolescents. Most parents' associations are affiliated to the government-aided National Association of Parents and Guardians which was formed in 1945.

Finance. Finance for secondary and vocational education comes from two main sources—the State and the municipalities.

The financing authorities of the Central Government are directly responsible, with certain exceptions, for almost all payments made to state schools. The State also makes grants to schools run by municipalities and to certain

GLOSSARY

NOTE. The diagram does not show the 9-year compulsory comprehensive school (*enhetsskola*), at present known as experimental school, which had been introduced in a 143 municiaplities by 1958/59.

anstalt för lägre yrkesutbildning: lower vocational training school of home economics (*husligt arbete*), commerce (*handel*) and industry and trade (*industri och hantverk*).

daghem or *lekskola:* pre-primary schools.

fackskola för huslig ekonomi: vocational training school of home economics.

folkhögskolorna: institutions offering part-time general secondary education for adults.

folkskola: an institution covering the period of compulsory schooling and comprising a primary infant department (see *småskola*), a primary school proper and one or two continuation classes at lower secondary level.

folkskoleseminarium: teacher training college.

gymnasium: State upper general secondary school with three streams, the *latinlinje*, emphasizing literary and classical studies, the *reallinje* with scientific subjects, and the *allmänlinje*, emphasizing social studies and languages.

gymnastiska centralinstitutet: teacher training school for teachers of physical education.

handelsgymnasium: vocational secondary school of commerce.

högre flickskola: municipal general secondary school for girls, with curriculum emphasizing home economics and related subjects.

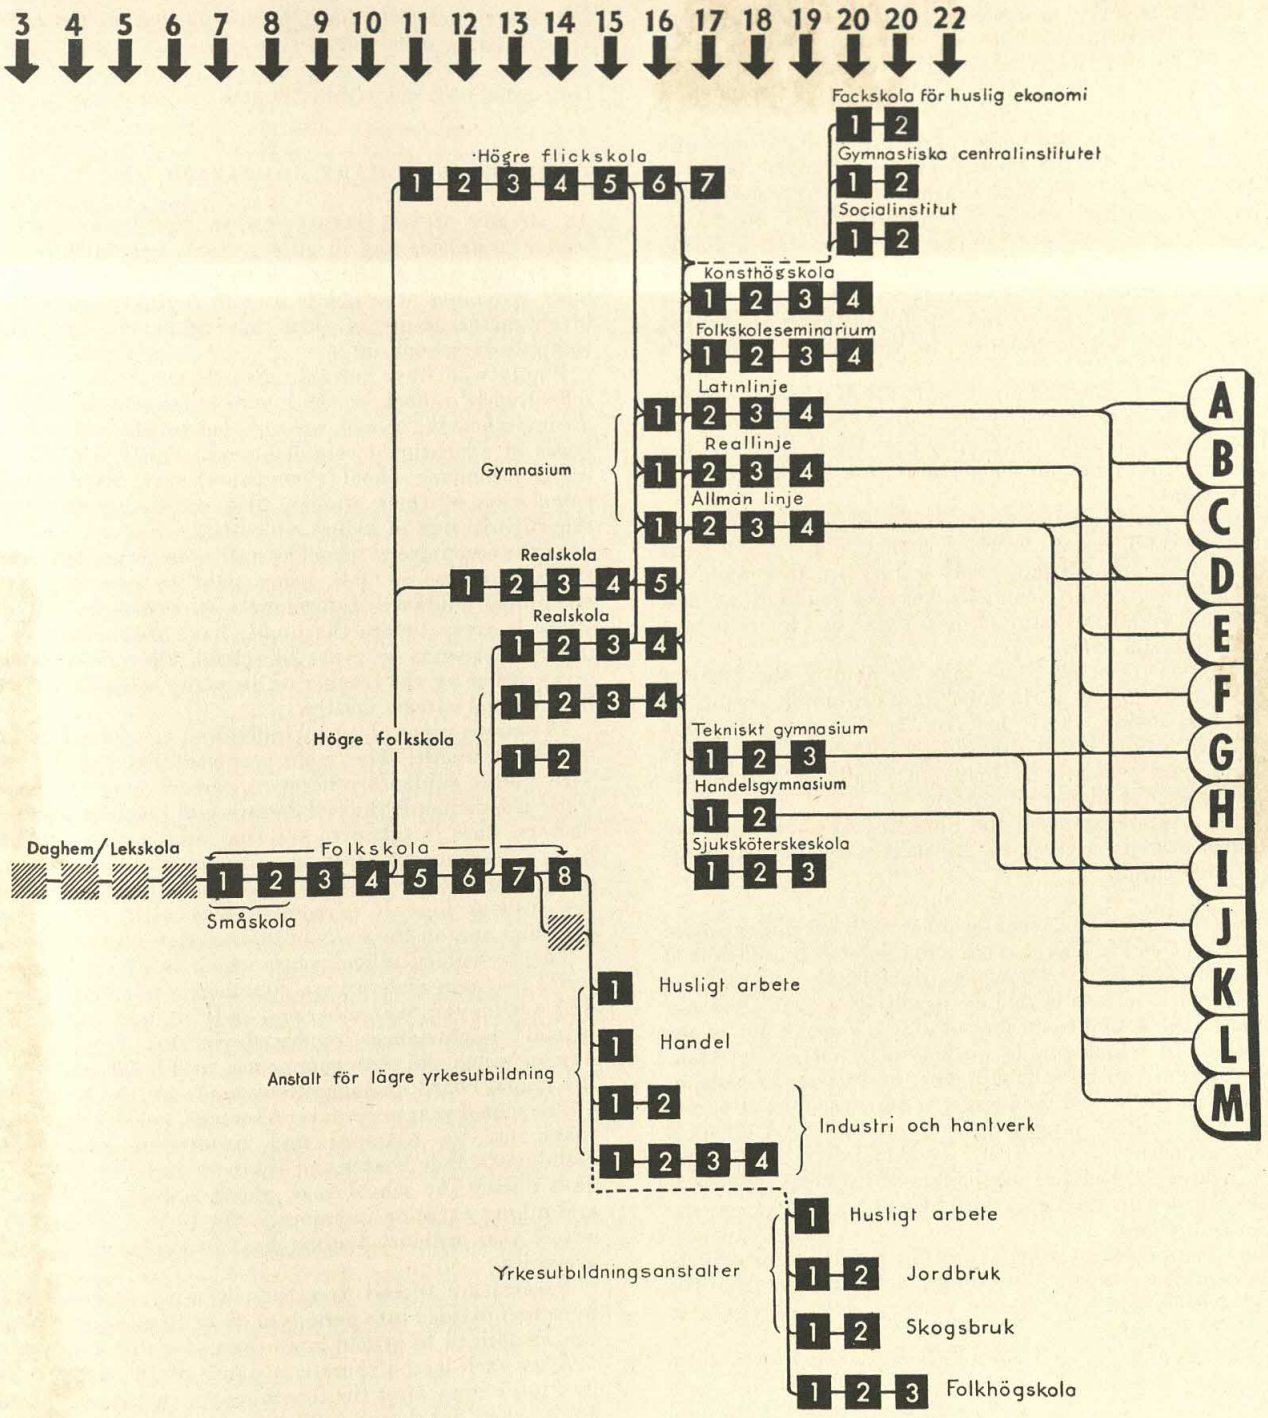
högre folkskola: lower general secondary school.

konsthögskola: vocational training school of fine arts.

småskola: lower infant department of primary school.

realskola: State lower general secondary school.

sjuksköterskeskola: vocational training school of nursing.



socialinstitut: vocational training schools for social welfare workers.

tekniskt gymnasium: vocational secondary school for technical training.

yrkesutbildningsanstalter: vocational training schools for pupils who have already had practical experience of domestic work (*husligt arbete*), agriculture (*jordbruk*) and forestry (*skogsbruk*).

private schools. Developments during the past decades seem to indicate that the total cost of education is being borne by the State and the municipalities in almost equal proportions, but there is a general tendency for the proportion of state contributions to increase.

As a general rule the body responsible for the school is also responsible for the upkeep of the premises. There is an exception to this rule in the case of state upper secondary schools (*gymnasier*), where the municipalities attend to the upkeep of the premises. Financing of non-state building for educational purposes is also carried out to an increasing extent with state funds and this gives legal justification for the extensive advice given and supervision exercised by the central authorities in relation to the planning of such buildings.

Education at state and municipal schools is free of charge. At state-aided private secondary schools term fees may be collected, the amount thereof being determined by the Board of Education on suggestions put forward by the school board.

Pupils attending secondary and vocational schools have various possibilities of obtaining economic assistance from public funds. In addition, study grants are also made by municipalities, county councils, private foundations and donors and organizations of various kinds, and by industrial and commercial firms.

Assistance from the State may be paid in the form of general study grants and study grants to pupils unable to obtain instruction where they live, as well as scholarships subject to a means test granted to students with modest incomes, and educational loans to pupils at certain establishments for higher education.

Further information on the financing of vocational and technical schools is given in the section dealing with this type of education.

School welfare services. At all secondary schools under public control a school health service administered or subsidized by the State is in operation. In principle, the work of the school health service is mainly prophylactic and does not extend to the actual treatment of illness. Supervision of the conditions in which pupils work is also part of its task. The service is run by school doctors and nurses in collaboration with the school management and teachers. It comes under the central administration of the Chief Medical Officer attached to the Board of Education. Each pupil has a health card giving particulars of his state of health, illnesses, etc. This card goes with him as he moves from one school to another.

The school dental service is run by municipal or private social initiative, and receives no financial support from the State. Nevertheless, it covers 65 per cent of pupils in secondary schools.

Schools are not obliged to provide meals but if they do so government grants are available on condition that such meals are free of charge to the pupils. During the school year 1958/59 about 47 per cent of all pupils received free school meals.

As a result of arrangements made by the municipalities, certain schools have access to the services of school psychologists, but this is something that is not generally organized. In order to encourage this trend, two regional school psychologists have been engaged at government expense as from the school year 1958/59. Each of them is to experiment with the planning of this work and instruct local organizations within his area.

TYPES OF SECONDARY EDUCATION

As already stated, instruction in the lower secondary school (*realskola*) and in girls' schools generally follows a 6-year course at a primary or comprehensive school. The basic schooling of students at folk high schools is varied in character, many of them having passed through the compulsory school only.

Pupils who have passed through the lower secondary school, girls' school, or the higher stage (classes 7 to 9) of a comprehensive school, are entitled to proceed to certain types of educational establishment. Those who enter an upper secondary school (*gymnasium*) may, after successful completion of their studies, pass on to a university or other institution of higher education.

In the compulsory school as well as in secondary schools, much attention is now being paid to educational and vocational guidance. Information on future conditions of study is given before the pupils have to choose between different streams or types of school. This information is given either by the teacher or, in many secondary schools, by a special careers master.

In various types of school individual vocational guidance is also available. The main responsibility for this rests with youth guidance officers or careers masters, but the work also demands the collaboration of teachers and school doctors. Care is taken to see that advice given does not have a detrimental effect on a student's sense of responsibility and initiative. The final decision must be made by the student himself in consultation with his parent or guardian and on the basis of information given to him.

The secondary school year, which is divided into two terms (autumn and spring), commences not later than the first weekday in September and ends in June, except where special circumstances render deviations necessary. The day on which the term commences and finishes is fixed by the school board on suggestions made by the headmaster.

The school year must cover 38 weeks, apart from the time taken up by entrance and promotion examinations. Holidays include Easter and Whitsun and 5 to 7 additional days during the school year, about 3 weeks at Christmas and a long vacation in summer. On 10 to 12 days in each school year ordinary lessons must be replaced by outdoor activities.

Lessons are spread over the six working days of each week and divided into periods of 45 or 40 minutes. No pupil can be obliged to attend more than seven lessons a day.

After each lesson there is a pause of 10 to 15 minutes. Not later than after the fourth lesson in the day there is an interval for lunch, which must last for at least 45 minutes.

For folk high schools, however, special regulations apply.

Lower secondary schools (*realskolor*). The majority of these are state establishments, organized either as separate institutions or incorporated with an upper secondary

school (*gymnasium*) to form a state secondary school (*högre allmänt läroverk*). In addition, there are municipal lower secondary schools and municipal practical lower secondary schools. A common feature of all of them is that they cover part of the period of compulsory school attendance, that they are a voluntary type of school, and that at the end of the course there is some form of lower certificate examination (*realexamen*).

The task of the lower secondary school is to continue and extend the preparation for good citizenship begun in the primary school. The range of subjects taught is consequently somewhat more extensive and more varied than at a primary school. English is studied from the first class onwards and German in the top three forms. French may be taken as an optional subject in the top form, mainly by those intending to go on to an upper secondary school. Otherwise the subjects taken are, on the whole, the same as in the primary school, including handicrafts and domestic science.

In practical lower secondary schools the aim is to provide basic training for certain groups of trades in addition to general education, and for this reason they have been organized in various streams, the most usual being the commercial, technical and domestic science streams.

Entrance to lower secondary schools takes place mainly at the end of the school year in June and is dependent on the applicants' results in the primary school. To be considered for entry an applicant must have secured at least a medium mark as an average for the subjects he has taken and also reached a certain standard in the two basic subjects, Swedish and mathematics. In most places the actual requirements are considerably higher than the prescribed minimum, because competition is keen.

At secondary schools there must be a senior teacher for each subject. Where necessary the senior teacher gives advice and information to other teachers in the subject, especially to younger and less experienced ones. Teachers taking the same subject meet together for a subject conference under the chairmanship of the headmaster or senior teacher in the subject. Such a conference is called by the headmaster when necessary, its purpose being to draw up courses of lessons for each class in conformity with prevailing syllabuses and time-tables and to prepare plans and methods for the treatment of the subject at various stages. It also has to consider the need for new textbooks and make suggestions to the school board concerning the introduction of new books.

Marks are generally given at the end of each term. Conditions governing promotion to a higher form are set out in detail and must be strictly complied with. Provided pupils have attained a certain standard, they may be transferred from the second highest class of the lower secondary school to the 4-year upper secondary school. If they stay on to complete the top class they sit for the lower certificate examination (*realexamen*), which also entitles them to enter an upper secondary school (the 3-year school).

The lower certificate examination consists of a written and an oral part. The written examination is taken first and covers Swedish, English, German, and mathematics, although only Swedish and two other subjects are compulsory. The oral test must be taken in at least four subjects.

Girls schools (*flickskolor*). The functions of earlier private girls' schools have largely been taken over by municipal girls' schools which give secondary instruction to a somewhat higher level than that of the ordinary lower secondary schools, the course of study being particularly designed for girls. Conditions of entry, curriculum, textbooks, requirements for promotion and regulations are mostly the same as for a *realskola*. The rate of work is rather more leisurely, however, since the girls sit no examination at the end. After completion of the course, they are given a certificate entitling them to take up certain types of work, mainly on the same terms as applicants who have passed the lower certificate examination.

In the two top forms of a girls' school pupils are divided into three streams—humanistic, general and modern. Where the number of pupils justifies it, each stream can be divided into two branches. One of the six branches concentrates mainly on practical domestic training.

Comprehensive school, higher stage. A fundamental principle connected with work in the comprehensive school is the endeavour to let pupils acquire knowledge and skill through active work. The subject matter must be dealt with as a connected whole so as to create in pupils a desire for continued training of a theoretical or practical kind and to give them sound social guidance. Much stress is laid on co-operation with the home. Instruction in social science is continued throughout the whole school period and is intended to be of a concrete nature based on the pupils' own practical experience. There is a greater measure of individual tuition and group work than has generally been the case with the traditional type of school.

The comprehensive school has three stages: a junior stage (classes 1–3), a middle stage (classes 4–6) and a senior stage (classes 7–9). Most pupils in the senior stage come directly from the middle stage of the same school. Since attendance at a comprehensive school is compulsory, there is no selection of pupils and all who attain a sufficiently high standard to merit promotion pass on to the senior stage.

From the seventh class onwards there is a certain amount of differentiation of subjects, based on advice in relation to studies and on vocational guidance, as a result of which pupils may choose various options in addition to the compulsory subjects. This continues until real specialization begins in class 9, which is divided into three streams —a general stream (9a), a stream preparing for the upper secondary school (9g), and a vocational stream (9y).

In the senior stage of the comprehensive school the subjects taken are (with certain optional alternatives) practically the same as at a *realskola*, with German as a second foreign language and French compulsory in 9g but optional in 9a. The grouping of material, however, differs from that in the lower secondary school. The compulsory 9-year course offers scope for logical and homogeneous arrangement throughout the whole period of schooling. The programme content is further divided into matter to be taken by all pupils and matter to be taken by certain pupils either individually or in groups.

The aim is that pupils in comprehensive schools shall have the same opportunities as those in lower secondary schools to pass on to higher schools and have access to occupations in the same fields.

The upper secondary school (*gymnasium*). The upper secondary school's twofold object is to provide secondary education beyond the level of the lower secondary school and prepare pupils for entrance to university and other institutions of higher education.

Most upper secondary schools are state establishments combined with a lower secondary (*realskola*) stage to form a state secondary school (*högre allmänt läroverk*). There are also municipal upper secondary schools, but the existence of these may be regarded mainly as a transitional stage leading to full state administration. In addition there are a small number of private upper secondary schools.

Courses last either three or four years. Pupils attending the 4-year upper secondary school usually come from the top form but one of a lower secondary school. The 3-year upper secondary school is intended for those who have passed the lower certificate examination (*realexamen*), but there are certain other entrance requirements as well. Entry to an upper secondary school is also open to pupils from municipal girls' schools and comprehensive schools (higher stage). Special state experimental 3-year upper secondary schools have been set up to receive pupils from comprehensive schools and to make experiments towards freer and more active forms for upper secondary education.

As regards the general nature of studies, the upper secondary school is divided into three streams—classical, natural science and general. Provided a certain minimum number of students present themselves, each stream is divided during the last two years into two branches. A pupil's choice of branch must be approved by his parent or guardian. In the classical stream there is a semi-classical and a full classical branch (with Greek), in the natural science stream a biology and a mathematics branch, and in the general stream a social science and a modern languages branch. In schools where there is no general stream, the modern languages branch can be included in the Latin or natural science streams; the social science branch can be placed in the natural science stream.

Special upper secondary schools for adults are being introduced. In addition, there are some upper secondary schools with evening courses for adults and a continuation upper secondary school where adults may complete previous studies at this level.

In the main the subjects taken are the same as at a lower secondary school, with certain additions. Thus philosophy is studied and the languages may include also Latin and Greek and in certain cases Spanish, Russian, Finnish and Italian. On the other hand, handicrafts and domestic science are excluded. It may be regarded as characteristic of an upper secondary school that there is intensive concentration on certain groups of subjects according to choice of stream and branch, opportunities to choose a subject according to aptitude and background and to pursue individual study under school supervision. The method is designed to develop the pupils' capacity for private study. In natural science subjects laboratory work is of great importance. Conditions concerning marks, textbooks, senior teachers and subject conferences, are much the same as those mentioned in connexion with the lower secondary school. Here again, marks play an important part and detailed requirements are prescribed for the promotion of pupils to higher stages.

At the completion of his upper secondary school course a pupil sits the higher certificate examination (*student-examen*) consisting of a written and an oral part. The Board of Education plans this examination in its entirety and it is administered by examiners appointed by the board.

The written examination covers tests in three or four subjects, including a general essay in Swedish, and also English. The oral examination now covers three or four, or at most five, of the compulsory subjects taken at the highest stage. Within the fixed limits, the subjects for the oral examination are chosen by the examiners. In order to secure a pass the examinee must be adjudged competent by at least half of the examiners in his group, but certain minimum requirements are also prescribed.

Folk high school. The folk high school lays essential emphasis on education designed to promote intelligent, individual thought. Particular attention is paid to training in citizenship in relation to both national and international affairs. In addition, the aim is to impart to students such practical knowledge and skill as will best fit them for their life's work, and certain folk high schools have already commenced giving preparatory training for entry to certain vocational schools.

Most folk high schools are regional in character, and often managed by the county council. The remainder are run by cultural, social or religious organizations, and are generally attended by students from the whole of the country. The minimum age of entry is 18 but the average age is 21.

Organization varies with different schools. During the winter months there is a first course of 22 to 30 weeks and usually a second course of the same length at a higher level. Some folk high schools have also a third course as well as summer courses specially designed for female students.

The folk high school is characterized by its wide variety of categories of students and working programmes. There is considerable freedom in regard to the arrangement of instruction, and courses and lessons are often planned by teachers and pupils in collaboration.

Teaching staff. Assistant masters (*adjunkter*) and subject teachers (*ämneslärare*) are employed as teachers of theoretical subjects at those types of school corresponding to the lower secondary school and the higher stage of a comprehensive school. The normal qualifications demanded of a secondary school assistant master are that he shall have obtained the *fil. mag.* (Master of Philosophy) degree at a university and have completed a course in teaching practice (*praktisk lärarkurs*).

For the *fil. mag.* examination—in so far as it is intended as an examination for secondary school teachers—various combinations of subjects may be taken according to the type of school. A pass in the primary school teacher's examination together with certain university qualifications may equal a pass in the *fil. mag.* examination for teaching in the lower secondary school.

Where the headmaster concerned thinks it advisable, assistant masters (*adjunkter*) at a lower secondary school may be transferred for full-time or part-time service at an upper secondary school. Otherwise a teacher at an upper

secondary school belongs to a separate category and is known as a *lektor* (senior master). In addition to the *fil. mag.* examination and a course in teaching practice, the qualifications demanded of a *lektor* are a pass in the licentiate examination in some of the subjects included in the curriculum. The *lektorer* often have a doctor's degree.

Teachers at folk high schools are recruited mainly from persons with university qualifications.

Various measures are at present in force or in preparation with a view to relieving the shortage of teaching staff and providing fresh opportunities for the training of teachers. Endeavours are also being made to amalgamate different categories of teacher training by means of joint facilities. In Stockholm and Malmö, teacher training universities have been established where future teachers in the middle and senior stages of the comprehensive school and the secondary schools can receive their pedagogic training, and where the middle stage teachers also receive their subject training. Several teachers' universities of this kind are to be set up and will gradually replace the training colleges for primary school teachers (*folkskoleseminarierna*) and the courses in teaching practice for secondary school teachers.

The training of teachers in practical subjects is carried out in special institutions—gymnastics teachers at the Royal Central Gymnastics Institute, music teachers at the Royal Academy of Music, art teachers at the Swedish State School of Arts, Crafts and Design, all of which are in Stockholm. Teachers of home economics and needlework are trained at a number of colleges specializing in those subjects. For teachers of handicrafts for men there was no special institute apart from a private continuation school where summer courses were arranged, but a college for handicraft teachers is being established from the school year 1960/61.

For vocational teachers in the vocational stream at a comprehensive experimental school the principal qualification is vocational skill. Special courses in teaching practice for such teachers have been established.

For secondary school assistant masters and subject teachers there are openings for advancement to higher paid grades. The reorganization of the educational system as from 1 July 1958 has led, *inter alia*, to the introduction of an increased number of posts for heads of schools, which has greatly augmented the possibilities for teachers to gain promotion.

The question of teachers' salaries is being dealt with in negotiations between the Government and the large teachers' unions.

Vocational and technical schools

I. Gymnasier and similar-level establishments under the Board of Vocational Training

Technical secondary schools (*högre tekniska läroverk*). These are government establishments the costs of which are defrayed by the State, although the municipality is under an obligation to maintain the premises without help from public funds. The establishments are organized partly as technical *gymnasia* and partly as specialized technical schools (*tekniska fackskolorna*).

Training at a technical *gymnasium* presupposes the standard of knowledge obtainable at a *realskola* and the minimum age of entry is 16 (although younger entrants may be accepted for special reasons). Before entering the school the student must have had at least two months' practical experience in industry and before he can be promoted to the highest form this practical experience must have been increased to a minimum of six months. The course normally lasts 3 years at the end of which students sit for the *Gymnasium* Engineers' Examination.

Training at specialized technical schools is spread over 2 years for daytime students, the terminal examination being the Specialized Technical School Engineers' Examination. At certain of these schools training is restricted to evening classes during the first two years, the length of the course being extended in consequence to 3 years. At technical secondary schools in Stockholm there are 4-year specialized technical streams with classes in the evenings only.

To be accepted for full-time training at a specialized technical school a student must have had at least two years' practical experience. For part-time training two months' experience is required. Before he can be promoted to the highest class a student's practical experience must have been increased to a minimum of two years. In addition, his knowledge of certain subjects must be equal to that required for a pass in the *realexamen* or, in the case of mathematics, in some instances of a higher standard still. The minimum age of entry is 17.

The School of Mines, Filipstad. The school gives basic training for the iron and steel industry and mining. It runs 2-year specialized courses in metallurgy, metallurgical chemistry and mining technique. The requirements for admission are the same as for specialized technical schools.

Technical institutes. There are two institutes which provide training for managers, overseers and workers in the textile industry. The institute at Borås has both 1-year and 2-year full-time courses. The requirements for admission are usually a minimum age of 17 and a certain amount of experience in the trade. The Textile Institute at Norrköping runs a 1-year full-time course and a 1-year evening course. The minimum age of entry is 16 and some experience in the trade is required. Both these institutes receive grants from the State.

The School of Industrial Art (*Konstfackskolan*). This school, which is in Stockholm and is run by the State, is divided into the following seven departments: textiles, decorative painting, sculpture, ceramics, furniture and interior decoration, metalwork, advertising and book production. The full-time lower courses last 2 years, the evening courses 3. Students with the necessary aptitude are admitted to the lower courses between the ages of 15 and 34 years. There is a 2-year higher course, to which students are admitted between the ages of 17 and 36 years; entrants must have completed the lower course at the school or have similar qualifications, and have had two months' practical experience and good artistic talent.

Training for art instructors is also given by this school.

Commercial secondary schools (*handelsgymnasier*). These are usually municipal establishments, apart from a few which are administered by foundations. The course aims at giving theoretical and practical training for posts as correspondence clerks, book-keepers, etc. The final certificate awarded is a qualification for admission to the commercial university.

For pupils who have passed the *realexamen* or possess knowledge of a comparable standard the full-time course lasts 2 years. At certain commercial *gymnasier* there are also 4-year courses in the evening, corresponding to the 2-year day-time course. For *gymnasium* (general secondary school) graduates there is a 1-year course.

Fees and scholarships. At technical secondary schools no registration fees or term fees are payable. This is not the case, however, with commercial *gymnasier*, where in some cases the fees charged are relatively high.

Students at technical *gymnasier* and those taking 2-year courses at commercial *gymnasier* can obtain state assistance, partly in the form of special study grants without means test and partly in the form of scholarships subject to a means test, these being awarded on the same principles as are applicable to students at state-aided municipal and private vocational schools. Further details of such assistance are given in a subsequent section of this chapter. Where a student has dependents to support, or in cases of hardship, state loans are obtainable for study purposes.

Students attending full-time courses at the remainder of the establishments dealt with in this section may obtain state loans or, subject to a means test, scholarships up to 100 crowns a month.

Matters concerning assistance to students for the purpose of study at the schools mentioned in this section are dealt with by the Study Grants Committee. In addition, general study grants are payable to students of 16 to 17 years of age in accordance with the usual rules. A state grant may also be paid to students' hostels attached to secondary level establishments on Royal authority.

II. Other schools and courses under the Board of Vocational Training

State-aided vocational schools (*yrkesskolor*) may be municipal vocational schools or county council vocational schools or private vocational schools. These schools run full-time and part-time courses. Some schools have both types of course, others only the one. There are also schools run by private firms at which training is given in conformity with a curriculum approved by the Board and for which state grants are available. Special training courses, retraining courses and continuation courses are organized for the unemployed. In addition to ordinary vocational training in schools, the traditional training of apprentices is carried on in various trades and crafts.

Municipal and county council vocational schools. The municipal vocational schools may be administered by a single municipality or a combination of several of them. A county council vocational school may be run by a county council, a combination of county councils, or a combination of a county council and a town not coming under a county council.

About 30 per cent of those taking courses at municipal vocational schools for industry and handicrafts, commerce and domestic science are full-time students; the remainder take part-time courses. The proportion, however, varies from one district to another.

The length of part-time courses and the number of hours' tuition per week vary considerably. The account that follows will be confined to the more important forms of full-time instruction and the longer part-time courses.

Workshop schools. The name workshop school (*verkstadsskola*) is given to full-time courses at which the students receive both practical and theoretical training for some trade or craft. As a rule the instruction is intended to give a basic all-round training in the trade and only in exceptional instances is it concerned with specialized work within a trade. Instruction in trade processes is given in a school workshop but can also be given alternately in the school workshop and at some outside works connected with the trade (alternating system). Theoretical training generally covers 8–10 hours a week, but more time may be taken in the first year's course if training in general subjects is also included. In addition to this, there is usually physical training. The normal school year lasts 42 weeks with a total of 45 hours' tuition a week. Most courses last for 2 years but in some trades there are courses of 1, 3 or 4 years.

Apart from the usual type of workshop school referred to above, where both theoretical and practical training take place at the school, there are also 'incorporated' workshop schools at which the practical side of the training is done at an outside industrial undertaking. The firm concerned maintains the equipment necessary for such training in its production departments or in a special instructional department. It also provides the pupils with suitable tasks and the instruction is usually given by works managers or foremen. To this extent the school is 'incorporated' in the firm, but in other respects it is independent of it and comes under the municipal vocational school. Economic relations between the school management (municipality) and the firm are regulated by special agreement. A state grant is paid to the municipality in respect of theoretical training and to the firm for the vocational practice.

Technical schools. Municipal technical schools (*tekniska skolor*) give theoretical and technical training based on the knowledge the pupils have acquired in the primary school. The schools are under the supervision of the Board of Vocational Education and are state-aided. Instruction is divided into a technicians' course, and a subsequent higher specialized course for personnel whose work will be more in the nature of that of an engineer. At some schools there are courses for technicians only.

At full-time technical schools the technicians' course lasts 18 months and the higher specialized course a further year. At part-time technical schools (evening schools), which usually operate four evenings a week, the technicians' course lasts 3 years and the higher specialized course 2 years.

The first two terms at a technical school and the first

four at a technical evening school also serve as qualifying courses for those wishing to gain admission to secondary technical schools. There are also special preparatory courses for applicants to a higher technical school.

Seamen's schools. The purpose of seamen's school (*sjömanesskolor*) is to train deck and engine-room personnel, marine electricians and kitchen staff. Training is full-time and specialized in different branches. The average length of courses is 21 weeks.

Schools for commerce and office training. Training may be designed to cover either office work or retail trade. To gain admission the pupil must have finished his compulsory schooling; in certain cases a pass in the lower certificate examination at a secondary school (*realexamen*) or equivalent knowledge is required.

Those taking office training usually study Swedish with business correspondence, trade and commerce, social science and economics, economic geography, English, and shorthand and typewriting. They may also take certain general subjects as well as German and French. The subjects usually studied on the retail trade side are Swedish with business correspondence, retail trade, social science, economics and the study of merchandise; accompanying subjects, as well as English and German, may also be studied. In some cases instruction is organized on the 'alternating system' whereby part of the practical training is carried out at retail businesses.

As regards full-time instruction, one-year courses are the most common, as stated above. The school year generally lasts 37–39 weeks with 34–37 hours' tuition a week. The age of entry varies between 15 and 18.

The commonest form of part-time instruction consists of evening classes in typewriting, shorthand, book-keeping and foreign languages. Tuition can also be had in a number of other commercial subjects, such as commerce, commercial law, business correspondence in Swedish, and window-dressing and signwriting.

Schools for household management and nursing. The term 'domestic science school' (*husmodersskola*) refers to full-time courses in household management, usually comprising practical training in household management (preparation of food and the running of a home), needlework and the care of children, and in some cases weaving. Theoretical training covers the study of nutrition, housekeeping, economics, the theory of needlework and weaving, hygiene and home nursing, the care and upbringing of children, social science and family affairs. Some domestic science schools also teach general subjects (corresponding to the 9y stream in the comprehensive school), including Swedish, mathematics, geography, biology and hygiene, chemistry and English (optional).

The domestic science school in some cases constitutes compulsory preliminary training for those, for example, who contemplate taking posts as children's nurses, manageresses of boarding schools and similar establishments, teachers of domestic science, etc.

At some 20 municipal vocational schools there are shorter full-time courses for children's nurses and nursing assistants.

Private state-aided vocational schools. Private vocational schools are administered by associations, trade organizations, foundations, industrial and commercial firms and individuals. State grants are payable on certain conditions. Besides shorter courses for industry and handicrafts, commerce and domestic science, there are also more comprehensive forms of training.

Fees and scholarships. At municipal vocational schools fees may be charged to the extent determined by the Board of Vocational Training, but no fees are payable by pupils of compulsory school age. In general, fees are low. At municipal workshop schools, training is usually free for pupils domiciled within the municipality in which the school is situated. At central workshop schools and seamen's schools tuition is entirely free. At private vocational schools the fees charged vary in amount.

Pupils of 16 and 17 years of age following full-time courses of at least four months' duration receive general study grants of 34 crowns a month as a continuation of the general child allowance.

Pupils following full-time courses at state-aided vocational schools may also obtain special study grants and scholarships (for exceptions see below). Scholarships are granted on the basis of a means test, whereas with study grants this is not the case. The maximum amount per month of the study grant and the limits within which scholarships lie may be seen from the following table.

MAXIMUM AMOUNT OF STUDY GRANT
(per month)

Grant	Older pupils (18 years upwards)	Younger pupils (up to and including 17 years)
	Crowns	*Crowns*
For board and lodging:		
For courses lasting at least 2 school years	75	60
For courses lasting from 4 months to 2 years:		
(a) accommodation in students' hostel	40	30
(b) local accommodation other than in a students' hostel	65	50
For daily travel	50	40
For one meal	15	14
For additional meal	7	6
Scholarship	100–15	75–10

As indicated earlier, the rules and amounts shown in the above table are applicable also to students at a technical *gymnasium* and the 2-year stream in a state-aided commercial *gymnasium*.

Decisions concerning study grants for students at certain establishments for specialized training are made by the Study Grants Committee, whilst all other questions relating to state study grants for pupils at state-aided vocational schools are dealt with by the Board of Vocational Training.

Training of apprentices in handicraft trades. In recent times there has been a considerable increase of interest in the training of apprentices in handicraft trades, and trade organizations are doing all they can to make such training

as effective as possible. With this end in view a central organization for dealing with apprenticeship questions, the Central Vocational Committee, has been set up within the Swedish Organization for Handicrafts and Industry. One of its objects is to draw up curricula and regulations for journeymen's tests applicable to the different trades. There is no legislation governing the rights and obligations of employers and employees in the matter of training apprentices. State grants may be made on application to firms undertaking to carry out such training.

Training in industry. The Swedish Employers' Association and the Confederation of Swedish Trade Unions have set up a joint council to deal with matters affecting training in industry. The rules on the training of apprentices recommended by the main organizations include provisions on the length of apprenticeship, employers' responsibilities towards the apprentice, obligations of apprentices, wages, etc. In both industry and the handicraft trades, a written agreement must be drawn up when the apprentice is taken on.

Special vocational training. Special vocational schools for training physically handicapped persons have been set up in Stockholm, Göteborg, Hälsingborg and Härnösand, and are attached to the orthopaedic clinics at the hospitals there, the costs being borne mainly from public funds; the Board of Vocational Education exercises supervision in educational matters.

Special state institutions provide vocational training for persons suffering from other infirmities, such as the deaf and the blind. These establishments come under the Board of Education.

For the vocational training of children and adolescents being cared for in children's homes, etc., there are state vocational schools as part of the child and adolescent social welfare system administered by the Social Welfare Board. A certain amount of vocational training is also given at homes for juvenile delinquents administered by the Prisons Board. The Board of Vocational Education exercises some educational supervision over such training.

III. Vocational training in agriculture, fisheries and forestry

Farm schools (*lantmannaskolorna*), which must be combined with school farms, provide seasonal and longer courses of up to one year. Entrants must be at least 18 years of age and have worked in agriculture for at least one year. Most farm schools are owned by the county councils.

Agricultural schools (*lantbruksskolorna*), which work in conjunction with school farms, give full-time courses lasting one and two years. The minimum age of entry for the animal husbandry course is 19 and for the other courses 18, in addition to which at least one year's practical experience in agricultural work is demanded.

Rural domestic science schools (*lanthushållskolorna*). In these schools the courses, which last six months or one year, cover practical and theoretical training in domestic science, needlework, weaving, horticulture and the care of animals, with theoretical instruction in health and hygiene, the care of children, social science, family affairs, etc. The minimum age of entry is 17, but some pupils may be accepted at 16. Most of these schools are administered by the county councils.

Agricultural vocational schools (*jordbrukets yrkesskolor*) are intended for younger persons (the minimum age is 14) than those who gain admission to the farm schools and rural domestic science schools. The schools run courses of one to two years in agriculture for boys, and at two of them there is also a one-year course in rural domestic science for girls. Pupils are admitted after they have completed the primary school.

At agricultural, farm and rural domestic schools 90 per cent of teachers' salaries are paid from state grants and state funds are also available for operating and building costs. Practically all the pupils at these schools can obtain full board either in the school hostels or through arrangements made by the school, and state grants for study purposes.

Horticultural schools (*trädgårdsskolor*). Vocational training in horticulture comprises courses for the training of horticulturists and horticultural advisers, etc., travelling courses in horticulture, training courses for arboriculturists, and courses for apprentices.

Training in agriculture, including dairy-farming and horticulture, is administered by the Board of Agriculture, which comes under the Department of Agriculture. Certain agricultural courses at municipal vocational schools are also arranged in consultation between the Board of Vocational Education and the Board of Agriculture.

At a special fisheries school established by the Fisheries Board, there is a 2-year course in fishery protection, pisciculture and fishing instruction for those wishing to take up such occupations. For those engaged in fishing as a livelihood there are also navigation courses at certain folk high schools, as well as travelling courses in fishery protection, fishing legislation, etc.

Forestry schools (*skogsskolor*). There are two temporary and five ordinary state schools of forestry administered by the Board of Crown Lands and Forests, and one private school which runs one-year courses for training foresters and auxiliary workers. The minimum age of entry is 19 and the maximum 30. Applicants must have at least 20 months' approved experience and have completed a 4-month preparatory course in forestry. The schools of forestry are boarding establishments, and state scholarships are awarded to those attending them.

State-aided vocational training for forestry workers and owners of forests is dealt with by the Forestry Protection Board under the Forestry Board. It is given partly in the form of basic training for juveniles and apprentices aged 15 to 20 years with little or no previous experience and partly as supplementary training.

Some training in forestry is also given at most farm schools and agricultural schools and at a number of such schools special forestry departments have been introduced.

IV. Other vocational training

In fields of trade and industry other than those dealt with above, extensive vocational training is given in schools and courses connected with public institutions or social undertakings, such as professional and vocational training for the armed forces, postal and telegraph and customs services, railways, tramways, etc.

Out-of-class activities

In accordance with directives now in force with a view to educating pupils in comradeship and citizenship, pupils are expected to participate in the maintenance of school discipline so as to accustom them to self-administration and responsibility. More detailed regulations in this respect are worked out by the headmaster in consultation with the teachers. In some schools an elected committee of pupils is responsible for such duties as maintaining order at the morning assembly and in the playground, checking on late-comers in the morning, and supervising school dinners. This committee gives expression to pupils' views and wishes, for example, in matters relating to behaviour, drawing up disciplinary rules, distribution of work, and measures to promote increased facilities for recreation.

In the instructions on methodology there appears a reminder that the school should seek to develop in its pupils an intelligent interest in social affairs and political questions. Discussion groups are of assistance here. In a school that includes a *gymnasium*, for example, the following associations may exist: an athletics association, a general literary and humanistic association, perhaps including music, amateur theatricals and photography in its programme, an art group, a natural science group, one or more Christian associations, and a temperance association.

The principal organizations concerned with gymnastics and sport are the Swedish Gymnastics Association and the Swedish School Sports Association, which are special bodies attached to the Swedish National Sports Association. The latter's principal means of propaganda is the School Sports Badge, which includes many branches of sport suitable for young people, and the Youth Gymnastics Badge. Contests are organized annually in practically all branches of athletics and sport, e.g., local and district contests and national contests run by the Swedish School Sports Association or by special organizing bodies appointed to it. The number of school sports associations at the present time is 1,954 and the total membership is 320,600.

TRENDS AND PROBLEMS

The more important organizational alterations in Swedish education, the change-over to the 9-year school and the reorganization of the practical side of teacher training, have already been dealt with briefly. Difficulties encountered at the present time include a shortage of teachers, particularly teachers of science subjects, insufficient premises, and the general organization of the educational system with particular reference to thinly-populated districts.

STATISTICS

Total population (mid-year 1958 estimate): 7,415,000.
Area: 173,623 square miles; 449,682 square kilometres.
Population density: 43 per square mile; 16 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, total enrolment (not including adult education) was nearly 1.3 million or about 18 per cent of the total population. Of these pupils, 2.5 per cent were in nursery schools and kindergartens; 69 per cent in primary or in special schools; 15 per cent in general secondary schools; 11 per cent in vocational schools, full-time or part-time; and 2.5 per cent in institutions of higher education including teacher training colleges. The proportion of girls was 49 per cent in primary education; 55 per cent in general secondary education; 65 per cent in teacher training; and 31 per cent in higher education.

Between 1953 and 1957, total enrolment increased by 9 per cent, the increase for general secondary education being 25 per cent; for vocational schools, 22 per cent; and for institutions of higher education, 32 per cent. In spite of a decline in the numbers attending teacher training schools (5,064 students in 1957 as compared with 6,395 in 1953), the average number of pupils per teacher in public primary schools and in all general secondary schools was still only 21 in 1957. (See Table 1.)

Enrolment trends in secondary education, 1930–57. Between 1930 and 1957, enrolment in general secondary education nearly tripled, and the proportion of girls rose from 50 to 55 per cent. Vocational school enrolment increased two and a half times between 1943 and 1957, but there was a drop in the number of pupils attending teacher training schools after 1950. Over the whole period the proportion of pupils in general secondary education fluctuated slightly around 60 per cent of the total secondary enrolment.

The secondary enrolment ratio, formed by relating average secondary enrolment to the estimated population 15–19 years old, steadily increased from the period 1930–34. (See Table 2.)

Examination results in secondary education, 1954–57. Comparing 1954 with 1957, the annual number of lower secondary (*realexamen*) certificates increased by 22 per cent, and of upper secondary (*studentexamen*) certificates by 36 per cent. In the latter year the proportion of girls among the successful candidates was 53 per cent for the *realexamen* and 45 per cent for the *studentexamen.* (See Table 3.)

Educational finance, 1956/57. In the fiscal year beginning in July 1956, the Central Government spent 1,280 million kronor, covering 59 per cent of the total public expenditure on education. The provincial and local authorities spent an additional 877 million kronor in the fiscal year beginning in January 1957, the local authorities contributing 38 per cent of the total educational expenditure. Average expenditure per inhabitant may be estimated at 295 kronor. Recurring expenditure accounted for 84 per cent of the total. (See Table 4.)

1. Including pupils in special classes, i.e., classes in regular schools for retarded children, socially maladjusted children and physically handicapped children (about 31,500 in 1957/58), in secondary classes attached to primary schools (about 6,500 in 1957/58), in regular classes 7–8 (about 86,000 in 1957/58), in voluntary classes 8–10 (about 4,000 in 1957/58), and in the upper stages of the 9 years compulsory school (about 23,000 in 1957/58).
2. Including part-time teachers.
3. Not including 13 (F.11) part-time teachers.
4. Public schools only, not including continuation schools.
5. Public schools only, not including part-time teachers, as follows: 1957/58, 4,800 (F.3,100); 1956/57, 4,700 (F.3,000); 1955/56, 4,400 (F.2,900); 1954/55, 4,100 (F.2,700); 1953/54, 3,900 (F.2,600).
6. Not including part-time teachers, as follows: 1957/58, *3,630 (F.1,460); 1956/57, *3,490 (F.1,440); 1955/56, *3,160 (F.1,320); 1954/55, *2,950 (F.1,230); 1953/54, *2,880 (F.1,250).
7. Not including enrolment in secondary classes attached to primary schools.

SWITZERLAND

The 25 cantons which make up the Swiss Confederation have full sovereignty over the organization of education. There is no legislation which applies to all Swiss schools; each canton promulgates its own laws and regulations, and this makes it difficult to give an overall picture of general and technical secondary education in Switzerland.

The fact that there are three national languages—German, French and Italian—constitutes another difficulty; in some cantons (Berne, Fribourg and Valais), different languages are spoken in different parts of the canton, and laws and regulations have to be promulgated in both German and French; the people of Grisons even have to deal with three languages—German, Italian and Romansch.

Another difficulty lies in the different terminology used. For example, the French equivalent of the Swiss German term *Sekundarschule* is not *école secondaire* but *école primaire supérieure*, i.e., it designates a school which offers a course at lower secondary level but which is considered an extension of the primary school and administered as such.[1]

THE EDUCATIONAL SYSTEM

The Federal Constitution laid down the general principles which should govern primary education and provided for a higher educational establishment to be opened in Zürich,

1. To avoid confusion the term 'general secondary school' will be used for schools which prepare pupils for higher education (*gymnase*, *Gymnasium*, *ginnasio*, etc.) and form the secondary school system, properly so called, and the term 'upper primary school' for those which provide a general education at lower secondary level but which are part of the primary school system.

the Federal Institute of Technology. (This is the only federal educational establishment.) There are no provisions regulating secondary education, but some laws have a more or less direct bearing on this level of schooling.

Examples of such laws are: the Federal Law of 24 June 1938 on the minimum age of workers, which prescribes that no one under 15 may become an apprentice, the effect of which is that the cantons are responsible for the education of children living within their boundaries until the age of 15; the Statute of 20 January 1925 on the recognition of the *maturité* certificate by the Swiss Federal Council (this will be referred to as the '1925 Statute'); the Federal Law of 13 June 1928 on the campaign against tuberculosis; the Federal Law of 26 June 1930 on vocational training, followed by the Federal Statutes of 23 December 1932, 11 September 1936 and 1 June 1956, on the same subject (the last of these deals with the teaching of domestic science and with vocational training for young peasant girls).

The 1925 Statute provides for a Federal Matriculation Commission authorized to draw up syllabuses, 'which shall be the same throughout the country', for the examination for the federal *maturité* certificate; this certificate is awarded to successful candidates at examinations organized in the three linguistic divisions of the country, both in state schools and in private schools which give certificates recognized by the federal authorities. There are three types of *maturité* certificate—type A, literary (Latin and Greek), type B, literary (Latin and modern languages) and type C, scientific. Only those who intend to train as doctors or dentists and those who wish to enter polytechnical schools are required to hold the federal *maturité* certificate, but in drawing up curricula the cantons have taken into account the requirements of the Matriculation Commission, which in any case are flexible enough to allow them a certain degree of freedom; as a result, there are marked differences between the schools which prepare pupils for these certificates. It is to be noted that the 'C' *maturité* certificate is fully recognized only by the Federal Institute of Technology, Zürich, the Polytechnical School of the University of Lausanne and the science faculties in the universities.

The law and federal statutes governing vocational training stipulate the methods to be used and the curricula to be followed in vocational training, and prescribe that such training shall be carried out under federal supervision through the Office Fédéral de l'Industrie, des Arts et Métiers et du Travail;[1] there is, therefore, much more uniformity in this branch of education than in others.

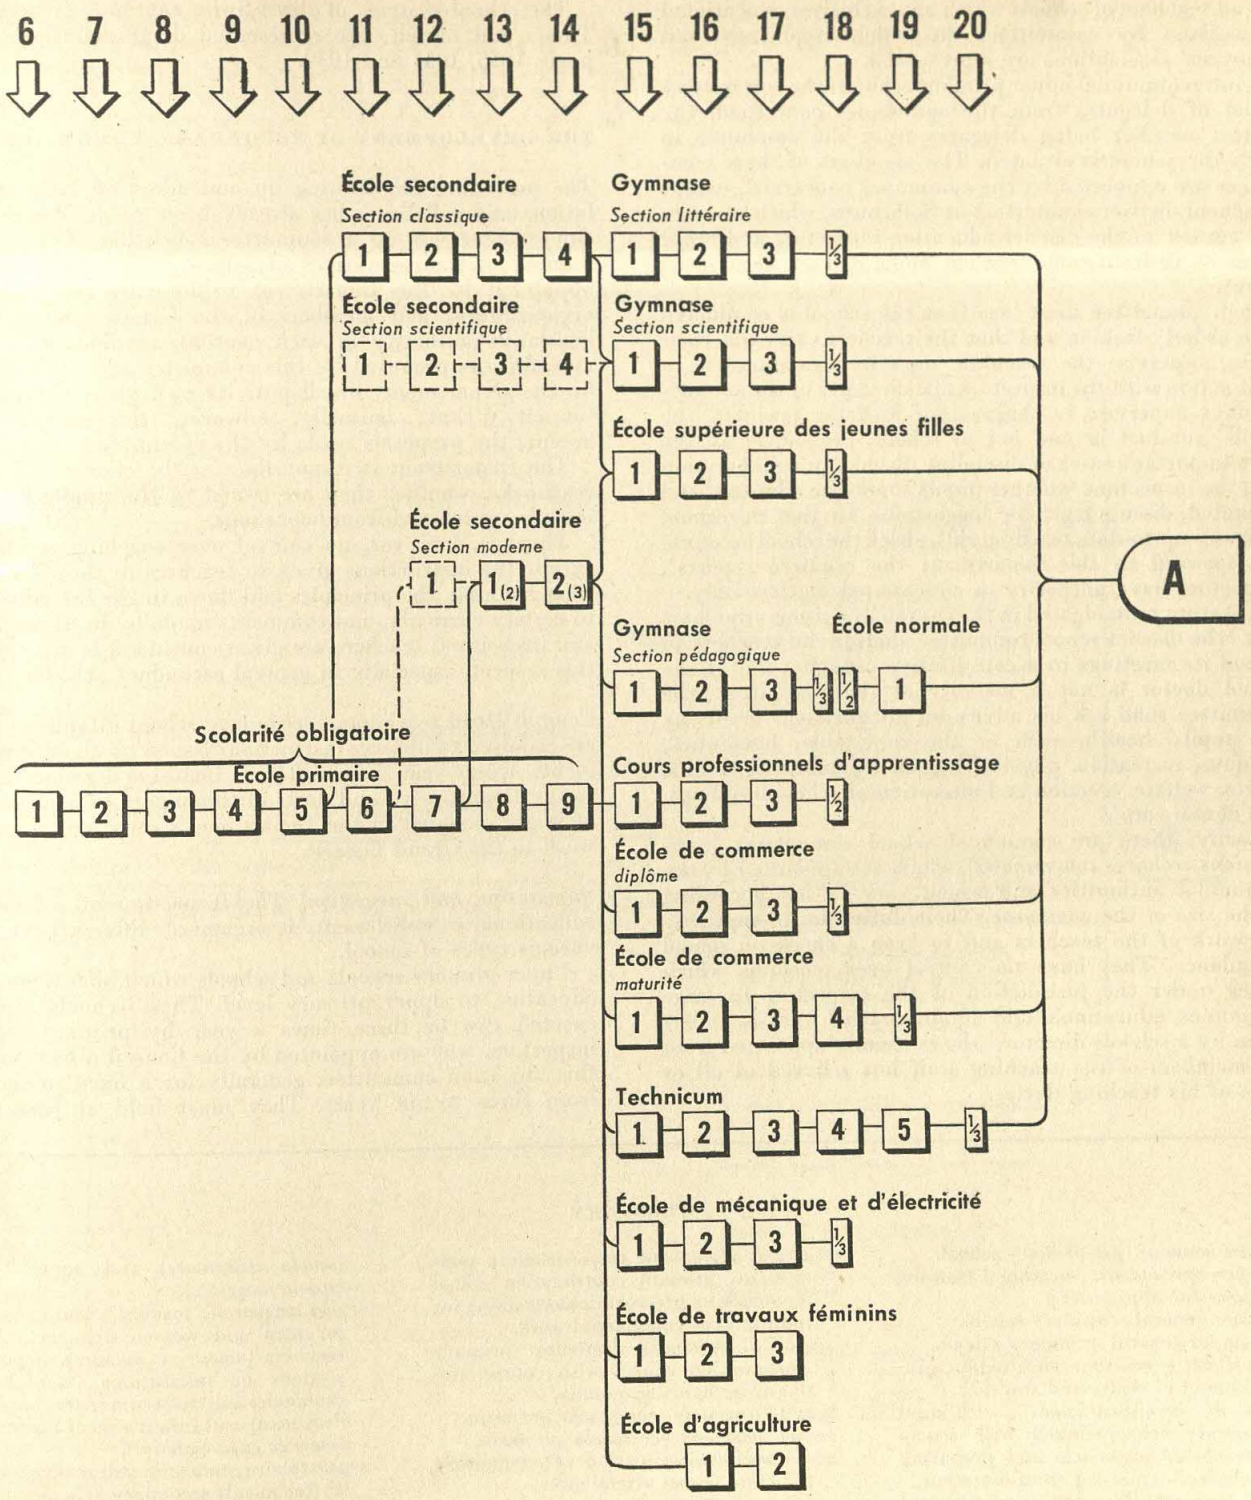
The role of the cantons and communes

The authorities of the cantons are responsible for the educational system, laws and regulations for the administration of the laws, the general supervision of schools, the preparation of curricula and the choice of textbooks and equipment. Normally, the Government or the Conseil d'Etat (the executive body) delegates its supervisory powers to the Department (or Directorate) of Public Education;[2] the Department of Agriculture and Industry is responsible for vocational training, and the Department of Public Works (in conjunction with the Department of Public Education) for the erection of school buildings, alterations and repairs.

In preparing plans for submission to the Conseil d'Etat and then to the Grand Conseil (the legislature) for approval, the Department is assisted either by: (a) *ad hoc* commissions, consisting partly or wholly of teachers concerned; or (b) a standing education board (*Conseil d'éducation, Erziehungsrat*), appointed by the Conseil d'Etat for the period of office of the legislature. There is an education board in many of the cantons; the number of members varies, and some boards have wider powers than others.

Cantonal and vocational schools are under the direction of a head teacher, assisted by a supervisory committee (*Commission de surveillance, Aufsichtskommission*) or a school council, which is appointed by the Government. These bodies perform the same work for these schools as communal school committees do for communal schools (see below).

1. Hereinafter referred to as OFIAMT.
2. Hereinafter referred to as 'the Department'.



GLOSSARY

NOTE. Classes shown in dotted outline are projected.

cours professionnels d'apprentissage: part-time vocational training schools for apprentices.
école d'agriculture: vocational training school of agriculture.
école de commerce: vocational secondary school of commerce offering a diploma course (4 years), and a course for the commercial *maturité* certificate which admits to higher commercial education.
école normale: teacher training school.
école primaire: primary school.
école de travaux féminins: vocational training school of home economics.
école secondaire: lower general secondary school with *section classique*, comprising obligatory study of Latin, and Greek as an option; and *section moderne* without Latin or Greek. It is proposed to introduce a *section scientifique.*
école supérieure des jeunes filles: general secondary school for girls.
gymnase: upper general secondary school organized in three sections,
  section littéraire, emphasizing classical and literary studies,
  section scientifique, emphasizing scientific studies, and
  section pédagogique, preparing for professional training as a teacher.
scolarité obligatoire: period of compulsory full-time school attendance.
section classique: see *école secondaire.*
section littéraire: see *gymnase.*
section moderne: see *école secondaire.*
section pédagogique: see *gymnase.*
section scientifique: see *gymnase.*
technicum: vocational secondary school of industrial arts, including a section for the training of technicians, a section for the training of skilled workers, and an art school.

HIGHER EDUCATION

A. University of Neuchâtel and various specialized institutes.

CANTON OF NEUCHÂTEL

Head teachers of schools which are exclusively vocational are assisted by committees on which employers' and employees' associations are represented.

In intercommunal upper primary schools, the committees consist of delegates from the communes concerned, the greatest number being delegates from the commune in which the school is situated. The members of these committees are appointed by the communes concerned, except the school district committees at Solothurn, which in every case consist of the district education inspectors and other members, including one teacher, appointed by the Conseil d'Etat.

Each committee must 'see that the school is conducted in an orderly fashion and that the teachers carry out their duties, supervise the teaching, organize examinations in conjunction with the inspectors, fix the dates of the summer holidays, supervise, in conjunction with the teachers, the pupils' conduct in and out of school, pronounce on the more important cases of discipline, decide, in collaboration with the inspectors, whether pupils should be admitted and promoted, discuss teachers' suggestions, see that the school possesses up-to-date teaching aids, check the school accounts and forward to the Department the required reports'. Inspectors have authority in educational matters only.

A statute promulgated in the canton of Grisons stipulates that 'the district school committee shall invite teachers to attend its meetings in a consultative capacity, and if the school doctor is not a member of the committee, the committee shall ask his advice on all questions involving the pupils' health, such as the time-table, homework, holidays, recreation, physical hygiene, gymnastics, baths, sports, welfare, erection and alteration of school buildings, and dental care'.

Lastly, there are communal school committees (*commissions scolaires communales*), which are appointed by the communal authorities and which vary in size according to the size of the commune. Their duties are to supervise the work of the teachers and to keep a check on school attendance. They have no control over teaching, which comes under the jurisdiction of the inspector. In large communes, educational and administrative work is undertaken by a schools director, who is usually appointed from the members of the teaching staff but relieved of all or some of his teaching duties.

The school systems of three Swiss cantons—Neuchâtel, Ticino and Zürich—are represented diagrammatically on pages 1055, 1057 and 1059.

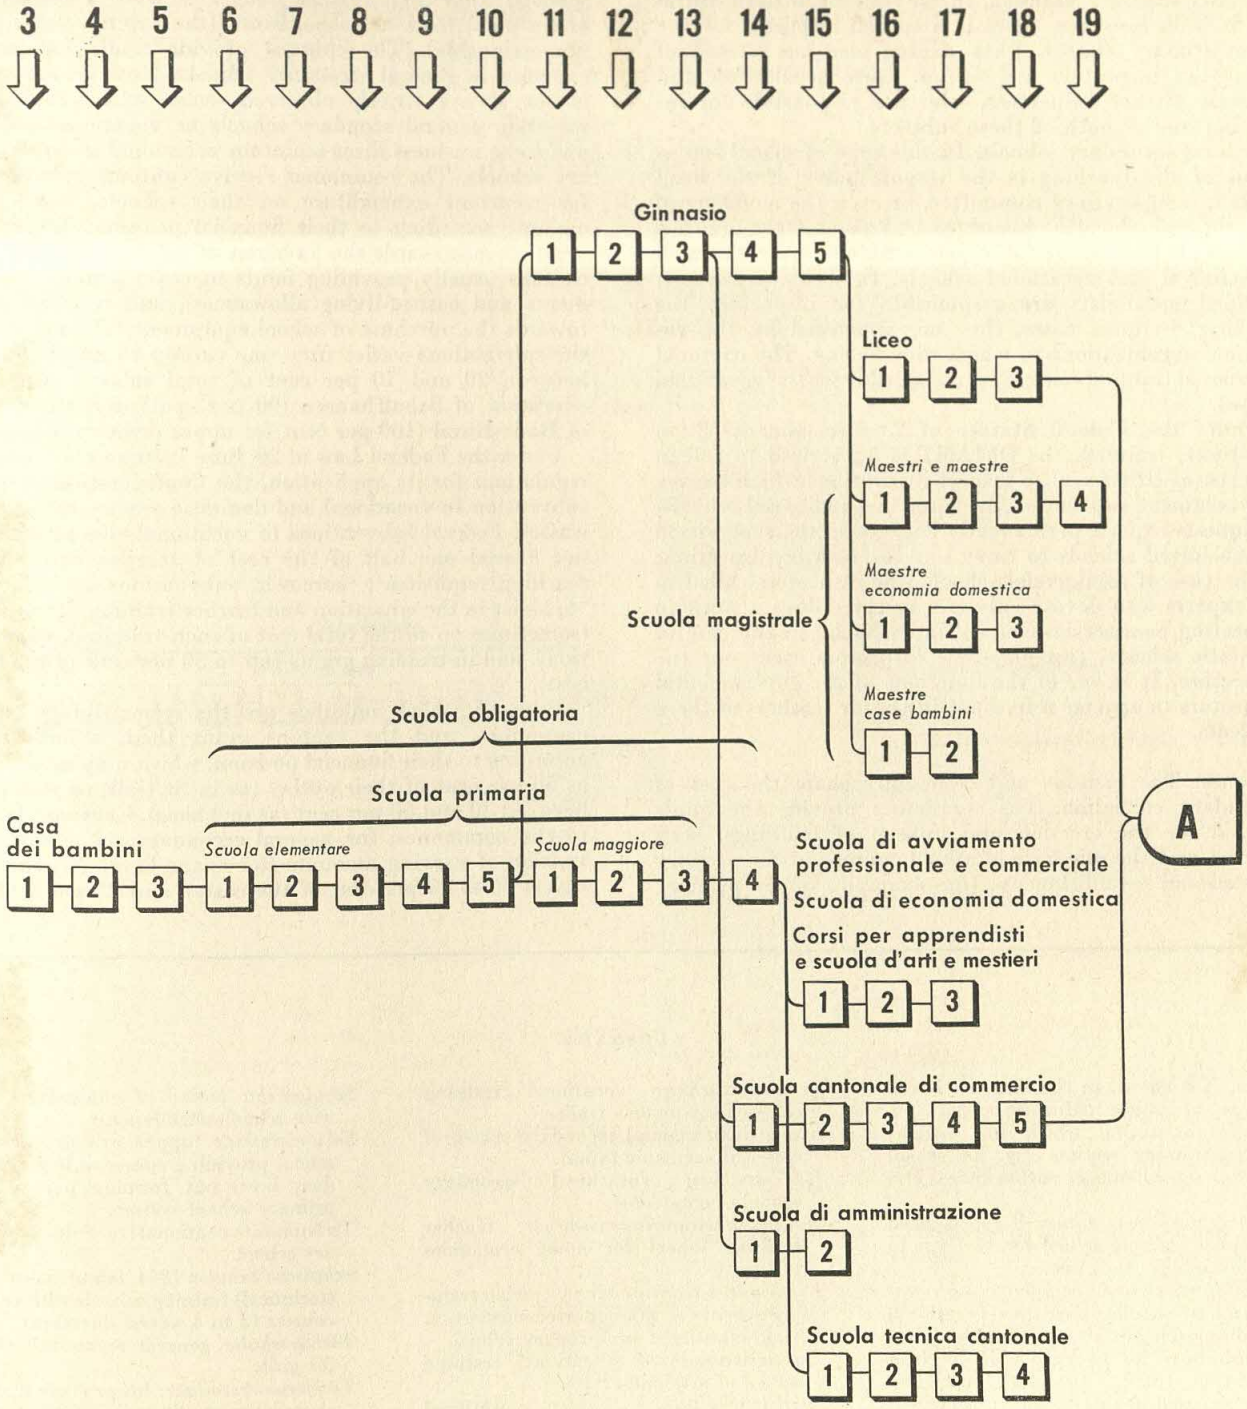
THE DEVELOPMENT OF SECONDARY EDUCATION

The procedure for drawing up and adopting laws, regulations and syllabuses has already been given. Where the Government sets up a committee consisting of an equal number of representatives of school principals, teachers appointed by the Department or by their professional organizations, and members of the Grand Conseil (the legislative authority in each canton), modifications and amendments proposed by this committee are not binding on the Department, which puts its own plans before the Conseil d'Etat; normally, however, the Department accepts the proposals made by the committee.

The Department is responsible for the choice of school textbooks, whether they are issued to the pupils free or must be purchased from bookshops.

There is, however, no control over teaching methods, except the instructions given to teachers in the course of their training, the principles laid down in the introduction to certain curricula, and comments made by head teachers and inspectors; teachers are given considerable latitude in this respect, especially in general secondary schools.

Control. Head teachers of secondary school establishments are required to observe instructions issued by their Departments. Every year they send in an inclusive detailed report to the Department, and parts of this report or a summary of it are included in the Department's own report on its work to the Grand Conseil.



Supervision and inspection. The inspection of secondary educational establishments is organized differently in the various types of school.

Upper primary schools and schools which offer a general education to upper primary level. These schools are inspected two or three times a year by primary school inspectors, who are appointed by the Conseil d'Etat or by the education committee, generally for a fixed period of from three to six years. They must hold at least the

GLOSSARY

casa dei bambini: pre-primary school.
corsi per apprendisti: vocational training courses for apprentices.
ginnasio: general secondary school.
liceo: upper general secondary school.
scuola d'arti e mestieri: vocational training school of crafts and trades.
scuola di amministrazione: vocational secondary school linked with *scuola cantonale di commercio* and preparing for clerical careers in administration.
scuola cantonale di commercio: cantonal vocational secondary school of commerce.
scuola di avviamento professionale e commerciale: primary continuation school emphasizing pre-vocational training for industrial or commercial work.
scuola di economia domestica: primary continuation school with course emphasizing home economics.
scuola elementare: see *scuola primaria.*
scuola maggiore: see *scuola primaria.*
scuola obbligatoria: period of compulsory full-time school attendance.
scuola primaria: primary school, comprising a lower (elementary) stage (*scuola elementare*) and upper stage (*scuola maggiore*).
scuola magistrale: teacher training school for men and women primary school teachers (*maestri e maestre*). Separate sections or institutions train home economics mistresses (*maestre economia domestica*) and infant school mistresses (*maestre casa bambini*).
scuola tecnica cantonale: cantonal vocational (technical) secondary school.

A. Higher education.

CANTON OF TICINO

secondary teachers' diploma. In the cantons of Basle-Rural and St. Gall, however, there is a special inspector for the upper primary classes. Each canton also has a staff of gymnastics inspectors and one or more needlework and domestic science inspectors, who are responsible for inspecting one or both of these subjects.

General secondary schools. In this type of school supervision of the teaching is the responsibility of the head teacher, a supervisory committee, or even the members of the cantonal education board (as in Valais). Only in a few instances is there a special inspector for this type of school.

Technical and vocational schools. In technical schools, qualified specialists are responsible for inspecting the teaching; in most cases, they are appointed by the vocational organizations to which they belong. The cantonal vocational training centres are responsible for the vocational classes.

Under the Federal Statute of 23 December 1932 on vocational training, the OFIAMT is authorized to call in experts (of either sex) to inspect institutions which receive a government subvention. In trade and industrial schools, it requests experts permanently engaged in the supervision of subsidized schools to carry out the task of inspection; in the case of commercial schools, the inspectors called in are experts who devote only two or three days a week to inspecting commercial courses and schools; in the case of domestic science, two part-time inspectors carry out the inspection. It is one of the functions of the governmental inspectors to arrange refresher courses for teachers of these subjects.

Finance. The cantons and communes share the cost of secondary education. The communes provide the funds needed for the erection and upkeep of buildings, staff salaries and the purchase of school equipment for primary educational establishments (for example, upper primary schools) from their regular budget or from a special tax or (in part) from a 'school fund' (the capital of which is non-assignable). The cantons provide funds for similar expenses in general secondary schools. However, this rule is not always strictly observed—some urban communes maintain general scondary schools or vocational schools, and some business firms maintain vocational lower secondary schools. The communes receive cantonal subventions for recurrent expenditure on their schools, varying in amount according to their financial position. These subventions go towards the payment of teachers' salaries (the cantons usually providing funds to cover seniority increments and cost-of-living allowances), and in some cases towards the purchase of school equipment. The amount of the subventions varies from one canton to another—it is between 20 and 70 per cent of total salaries, with the exception of Schaffhausen (90 per cent) and the canton of Basle-Rural (100 per cent for upper primary schools).

Under the Federal Law of 26 June 1930 and the detailed regulations for its application, the Confederation grants a subvention to vocational and domestic science schools and classes. Federal subventions to vocational education 'shall not exceed one half of the cost of salaries and general teaching requisites'; moreover, subventions are allocated 'to assist in the education and further training of teachers' (sometimes up to the total cost of such training), examinations, and in-training grants (up to 50 per cent of the total cost).

Primary school buildings are the responsibility of the communes, and the cantons grant them a subvention according to their financial position, which may be as much as 50 per cent of their outlay (as in St. Gall) or may vary between 30 and 60 per cent (as in Valais). Cantons allocate to the communes, for general secondary schools, a subvention of varying amounts (for example, at Neuchâtel it covers 30 to 45 per cent of the costs), and 25 per cent for

GLOSSARY

NOTE. Not shown in the diagram is the College of Music (*Musikhochschule*), a private institution which has various teacher-training sections e.g. for school singing, school music, eurhythmics, etc.

Arbeitslehrerinnenseminar: specialized teacher training school for teachers in trade schools for girls.

Fortbildungsschulen (complementary vocational schools): part-time vocational training schools, attendance at which is compulsory for young people not in a full-time school at secondary level; they are grouped in three main categories—agricultural and industrial (*landwirtschaftliche und gewerbliche*), commercial (*kaufmännische*), and home economics (*hauswirtschaftliche*) schools.

Frauenfachschule: vocational training school for women's trades.

Gymnasium: general secondary school of classical academic type.

Handelsschule: vocational secondary school of commerce.

Haushaltunglehrerinnenseminar: teacher training school for home economics mistresses.

Kindergärtnerinnenseminar: teacher training school for kindergarten mistresses.

Kleinkinderschule: pre-primary school.

Kunstgewerbeschule: vocational training school of arts and crafts.

landwirtschaftliche Schule: vocational training school of agriculture.

Oberrealschule: general secondary school with scientific course.

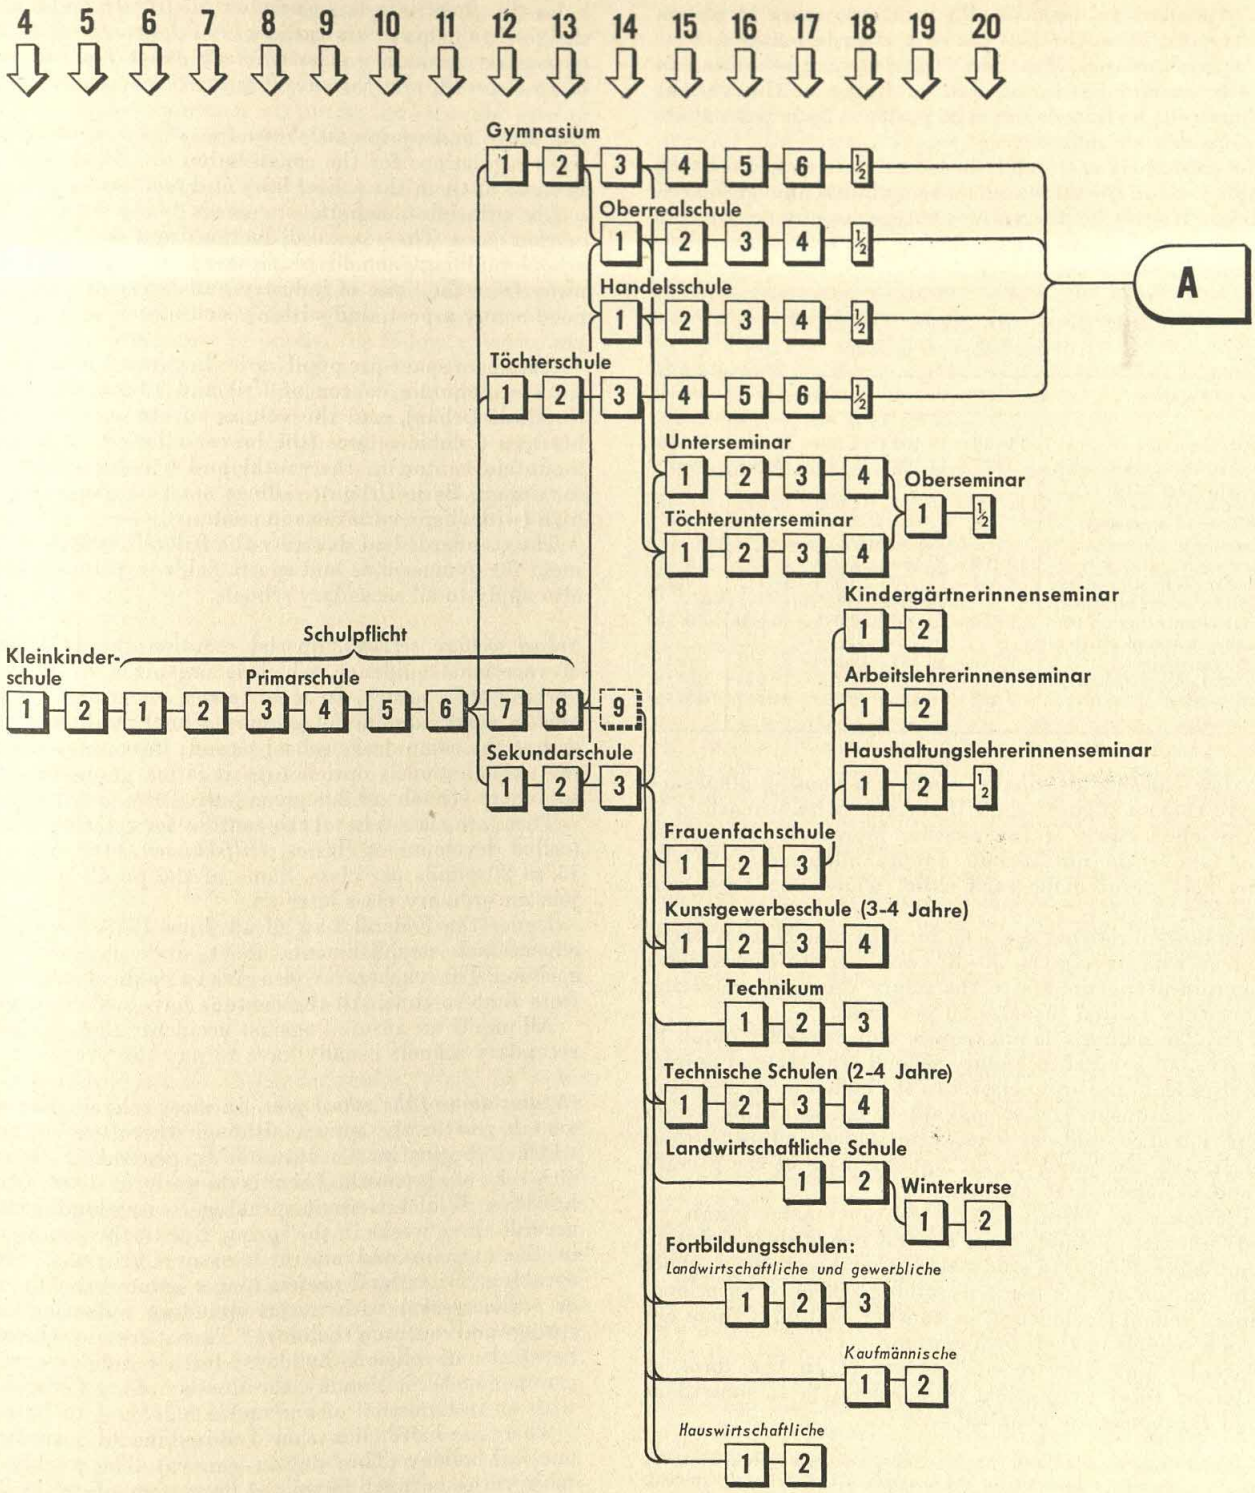
Oberseminar: upper stage (professional training) at teacher training school.

Primarschule: primary school.

Schulpflicht: period of compulsory full-time school attendance.

Sekundarschule (upper primary school): school providing course at lower secondary level but forming part of the primary school system.

Technikum: vocational (technical) secondary school.



technische Schulen (2–4 Jahre): vocational (technical) training schools with various courses (2 to 4 years' duration).

Töchterschule: general secondary school for girls.

Töchterunterseminar: lower stage (general secondary studies) in girls' teacher training school.

Unterseminar: lower stage (general secondary studies) in teacher training school.

A. University or polytechnic.

CANTON OF ZÜRICH

buildings used in vocational education; there is also a federal subvention towards the cost of these buildings.[1]

Teachers' salaries. Teachers' salaries vary according to the educational level, the cost of living in the various cantons and the latter's financial position. Sometimes there is a considerable difference.

The table below, which is based on data supplied by 16 cantons, shows the minimum and maximum annual salaries (in Swiss francs) for the various categories of teachers, and the number of years' service before the maximum salary is reached in each case.

RANGE OF TEACHERS' SALARIES
(in Swiss francs per annum)

Category	Minimum	Maximum	Years
School inspectors	15 512 – 18 100	15 759 – 21 600	10–16
School inspectors (female)	9 828 – 11 700	12 074 – 16 300	10–16
Masters at a general secondary school	11 240 – 16 244	14 000 – 22 401	10–15
Mistresses at a general secondary school	As for masters in some cantons		
Mistresses at other schools	10 100 – 12 600	12 600 – 17 980	10–15
Secondary school masters	8 364 – 13 970	13 056 – 19 117	10–12
Secondary school mistresses	As for masters in some cantons		
Mistresses at other schools	9 800 – 12 000	12 074 – 16 600	10–16
Vocational school masters (general subjects)	9 500 – 16 537	10 500 – 22 401	10–15
Domestic science teachers	6 200 – 9 023	7 700 – 12 950	10–15
Needlework teachers	7 200 – 8 100	10 200 – 11 967	10–15

A few cantons also make teachers a housing allowance or pay them a higher salary if the school they teach at is in the chief town of the canton. Moreover, the figures given above do not include family allowances nor the allowances granted for each child, which also vary considerably.

The normal retiring age is 65 for men and 60 for women; teachers who have given 30–40 years' service then receive a pension proportionate to the salary they were receiving before they retired (usually 60 per cent).

Fees. The cantons do not require upper primary pupils to pay fees. In general secondary schools, the scale of annual fees rises from the lower classes to the higher ones, although in some cantons no fees are payable in classes falling within the period of compulsory school attendance. In Basle-Urban and St. Gall, the pupils in the upper classes of the general secondary schools pay no fees.

Assistance to parents. Many cantons make grants to needy parents to enable them to send two of their children, if they have ability, to study at a general secondary school in the canton or to a teacher training school or vocational training school (technicum) in another canton, if there are no such schools in their own canton.

Parents may also receive assistance in the form of partial or total exemption from school fees; sometimes school textbooks are supplied free.

1. An interesting case is that of the Technicum pour la Suisse Centrale, which was built at Lucerne for the cantons of Uri, Schwyz, Obwald, Nidwald, Zug and Lucerne. Under an agreement dated 14 October 1957, the first five of these cantons were together to pay 400,000 francs towards the construction of the building, and 65,000 annually, these amounts being divided in proportion to the population of each canton.

Lastly, there is a large number of private endowments designed to help certain categories of apprentices or pupils at general secondary schools. Very strict conditions are often imposed, and the subsidies are often small.

Buildings and equipment. Very few of the cantons have fixed regulations for the construction of school buildings; in most of them the school laws and regulations lay down a few principles, definite standards being fixed only in certain cases. The general deduction from the laws is that school buildings should be situated in a good position, away from the noise of industry and heavy traffic, with a good sunny aspect, and within reach of cafés, restaurants, etc.

Classroom space per pupil varies between 1 square metre (in the mountain canton of Uri) and 1.80 square metres (in Basle-Urban), and the volume of air per pupil varies between 4 cubic metres (the lowest allowed, in Ticino, a mountain canton in the south) and 6 cubic metres (the maximum, Basle-Urban); ceilings must be about 3 metres high (with slight variations in cantons).

The standards laid down by the federal military department for gymnasiums and sports fields in primary schools also apply to all secondary schools.

School welfare services. Special mention should be made of vocational guidance, which is organized in almost all parts of the country. In most towns, vocational guidance officers must examine all primary school pupils before the end of the compulsory school period; in country districts, the examination is optional (as it is for pupils in general secondary schools) and is given only if the parents wish it.

There are classes in all the cantons for retarded children (called development classes, *Hilfsklassen*, etc.), with from 15 to 20 pupils per class. Some of the pupils are able to join an ordinary class later on.

Under the Federal Law of 13 June 1928, pupils in all educational establishments must undergo medical inspection. The teachers are also given a medical examination from time to time. All the cantons have a dental service.

All pupils are insured against accident; those at general secondary schools usually have to pay the premiums.

Organization of the school year. In most schools, the school year begins in the spring, although there are cantons in which it begins in the autumn. In general, it comprises 40 weeks of classwork. There is no uniform distribution of holidays. Whilst German-speaking Switzerland generally accords three weeks in the spring, five in the summer, two in the autumn and one or two at Christmas, French-speaking Switzerland prefers longer summer holidays (six or seven weeks) with a corresponding reduction in the spring and autumn holidays. There are no classes on national and religious holidays; further holidays are now common on Whit Monday, the Monday of the Federal Fast, with an intermission of one and a half days in February.

There are half-holidays on Wednesday and Saturdays, or one full holiday (Thursday in Geneva). The weekly timetable varies between 30 and 34 hours, including the 2, and more frequently, 3 hours spent in gymnastics and, sometimes, in optional classes. The length of each lesson varies according to region between 40 and 50 minutes.

Choice of studies. Choice is left entirely to the discretion of parents. Teachers advise the parents of those children whom they consider suitable for entry to upper primary or general secondary schools. In primary education, the vocational guidance service examines all pupils between the ages of 15 and 16, and advises them about the choice of an occupation suited to their abilities.

In schools of Group II (see below)—with the exception of a very few establishments which have school psychologists—head teachers and teachers meet parents and advise them in choosing studies for their children. There is an increasing tendency to introduce in the early classes of these schools a kind of 'school guidance', based on the intellectual performance of pupils who follow a curriculum offering a wide range of optional subjects. The most advanced of these experiments is that of Vaud, where, during a period of two years (between the ages of 10 and 12), all pupils in the *collèges* (lower general secondary schools) follow the same curriculum, which permits a more methodical system of school guidance, without obligation to parents. In Geneva, parents receive 'advice reports', which provide detailed information on scholastic and vocational guidance.

TYPES OF SECONDARY EDUCATION

Educational institutions which succeed the primary school may be divided into three groups. The first comprises pre-apprenticeship or vocational guidance classes, upper primary schools and part-time continuation classes. The second group includes general secondary schools which lead to higher education, and the third is teacher training schools.

Group I

Pre-apprenticeship or vocational guidance classes. These are, strictly speaking, primary classes strongly directed towards manual occupations, and are attended by pupils between 14 and 15 who are unable or do not wish to receive more extensive schooling.

Upper primary schools (*Sekundarschulen*, etc.). In some cases these are considered to be reserved exclusively for the better pupils from the fifth or sixth years of the primary cycle who will enter employment on completing the course; in other cases they are also intended to prepare pupils for the lower general secondary schools and eventually for more advanced studies.

Most upper primary schools hold an entrance examination (in some cantons the marks obtained in the last year of primary studies are also taken into consideration); in Appenzell-Outer Rhoden, however, the school committee, acting on the proposals of teachers, decides on admission, and at St. Gall written work from the final year of primary school must be submitted to the school committee.

Where examinations are held, they are based on the curriculum of the primary class which precedes entry to the upper primary school; teachers of the latter form the jury for the examination, which in most cases comprises only two parts (mother tongue and arithmetic). A study of the curricula of upper primary schools reveals a close similarity between them. The following compulsory subjects are found everywhere: religion, mother tongue, second national language, arithmetic, algebra, geometry, accounting, history, geography, natural sciences, physics, chemistry, handwriting, freehand drawing, technical drawing (for boys), singing, gymnastics, and needlework (for girls). Uri, which is close to Ticino, adds Italian to this list. More variety may be noted in the optional subjects.

As an example, the table on page 1062 gives the weekly time-table for the upper primary schools of St. Gall (3 years of studies) and of Basle-Urban; in the latter canton, children enter upper primary school (the boys' schools are known as *Realschulen*) at the age of 10, and remain for 5 years if they are to enter employment, and for 4 years if they intend to enter a commercial school, a school for domestic science mistresses or the section for kindergarten mistresses in the teacher training school.

Continuation or complementary courses. These courses, which are compulsory for young people not attending a post-primary establishment, are held during the winter; they are intended for adolescents between the ages of 15 or 16 and 19, and last 9 or 10 weeks, with a time-table of 6 hours each week. Their aim is 'the intellectual and moral development of young people, as well as training for citizenship, with due regard to local requirements and the needs of practical life'; the general curriculum includes reading, essays or composition, arithmetic, history and civics, geography, gymnastics and singing, subject to changes introduced in the light of the occupational requirements of the young people; in addition, there are also 'lectures and practical courses'. In some cantons the curriculum is restricted to the following subjects: reading, handwriting, arithmetic, correspondence, accounting, civics (Uri); other cantons, such as Solothurn, divide these subjects into three groups—vocational subjects (technical drawing, machine shop, work organization, work contracts and accounting), civics, and cultural subjects (character-building, the mother tongue and practical skills).

In the rural continuation courses, concepts of agriculture and arboriculture are added to the basic curriculum; teaching of these subjects is entrusted to specialists.

Domestic education (for girls only) is provided in the last year or two years of the primary cycle, in the final year of upper primary school (rarely in general secondary schools), or in complementary domestic courses. This subject receives considerable attention in all cantons, and is organized in various ways. Some cantons include domestic education in the general curriculum, where it is taught for a few hours each week over a period of 2 or 3 years.

Girls who have not received domestic education at school must take an annual course, consisting of a minimum of 240 hours, or two annual courses of 120 hours minimum. Only those girls who are attending a post-primary establishment, or who hold a firm apprenticeship contract are exempt from this obligation. The curriculum of these courses is exclusively practical. At St. Gall, the 120 hours of the first-year course are divided as follows: mother tongue, 30; needlework, 70; household activities, care of clothes and family hygiene, 20. The second year covers: mother tongue, 20 hours; civics and law, 30; cooking and nutrition (including household budgeting), 70.

TIME-TABLE FOR UPPER PRIMARY SCHOOLS

1. In summer, the third hour is replaced by an afternoon of sport.
2. Two hours during the winter term.
3. Compulsory for pupils whose handwriting is bad.

Group II

This group includes the lower and upper general secondary schools (*progymnases* and *gymnases* and the commercial secondary schools). All candidates for the lower general secondary schools (*progymnases*) and for the commercial schools must pass an entrance examination based on the curriculum of the immediately preceding primary class. This examination comprises a test of the mother tongue and an arithmetic test. However, some commercial schools admit without examination those pupils of *progymnases* who fulfil the normal conditions for promotion to a higher class; this is the case in Geneva and Lausanne, among others. Lausanne even accepts into the second-year class (at the age of 15) those pupils who have the upper primary certificate, and into the third-year class (at the age of 16) those pupils who hold the lower secondary certificate (*progymnases*).

In all cases, however, admission is provisional: candidates are admitted for several weeks or a term, after which the teachers decide, on the basis of marks received for conduct and for work, whether or not they are to be retained.

Parents of pupils in *progymnases*, general secondary schools and commercial schools regularly receive a report (*bulletin de notes*).

The average grading obtained in the two or three annual reports is the deciding factor for promotion to a higher class. Norms are fixed by the cantonal or school authorities. The grading scale of marks varies according to the school; sometimes it goes from 0 (zero) to 10, sometimes from 1 (unsatisfactory) to 6 (excellent), and sometimes from 6 (unsatisfactory) to 1 (excellent). To be promoted, the pupil must obtain an average of at least 6 or 4 or 3.5, according to the system adopted. It often happens that to emphasize the importance of some of them, subjects are divided into two or even three groups, for each of which the average must be obtained; gradings obtained within a given group may compensate each other, but compensation never extends from one group to another.

Lower and upper general secondary schools. Since the schools which prepare pupils for university studies base their syllabuses on those established by the Federal Matriculation Commission, it may be useful at the outset to note the main elements of the 'Regulations for federal *maturité* examinations' (20 January 1925). As already pointed out, three types of *maturité* certificate are recognized: type A—literary, with Latin and Greek; type B—literary, with Latin and modern languages; type C—scientific.

Subjects common to the syllabuses of examinations for all three types of certificate are mother tongue (French, German or Italian), second national language, history, geography, mathematics, physics, chemistry, natural sciences, drawing.

The examination syllabus for type A also includes Latin and Greek, that for type B Latin and the third national language or English, that for type C descriptive geometry and the third national language or English.

The regulations require the following written examinations: a composition in the mother tongue; translation into the foreign modern languages; translation from the ancient languages (from a printed text); problems in mathematics, physics and descriptive geometry; drawing from life or still life or of a simple object.

The purpose of the examination is clearly defined:

'The examination should make it possible to judge whether the candidate possesses the maturity of thought and independence of judgement necessary for advanced studies. Maturity of thought presupposes a certain amount of positive knowledge, but purely bookish learning is not sufficient. The candidate should be capable not only of replying to questions on the subjects from the examination syllabus, but also of understanding problems of an equivalent depth, penetrating them, and providing a correct and exact solution.'

Holders of a *maturité* certificate of type C may be admitted to the federal examinations in medicine only if they have satisfied the Federal Matriculation Commission in an additional examination in Latin, which includes written and oral parts.

Candidates may take the examination in one or two sessions; they indicate their preference in their application, which states the optional subject to be taken, and is accompanied by various documents such as civil papers (the candidate must be 18 years of age), certificates from the schools attended, curriculum vitae, indications of the candidate's future studies etc.

Teachers from the locality in which the examination is held are responsible for preparing the written and oral papers, and also interview the candidates. In the gradings awarded, which extend from 1 (very poor) to 6 (excellent), those for the following subjects count twice as much as the others: type A—mother tongue, mathematics, Latin and Greek; type B—mother tongue, second national language, mathematics and Latin; type C—mother tongue, second national language, mathematics and physics.

The certificate is refused to candidates whose gradings include the following: one 1, or two 2's, or one 2 and two 3's, or more than three 3's, or who obtain fewer than 58 marks for the 11 subjects.

Pupils in public and private general secondary schools recognized by the Confederation take the *maturité* examinations in the school which they attend. A candidate who has failed may take the examination again after a minimum interval of six months; if he does so within two years, he may be exempted from papers for which he received at least 5 the first time, and earlier-acquired gradings of 5 and 6 are credited to him.

In the additional examination in Latin, the candidate must obtain 'an average grading of at least 4 in written and oral parts'. In case of failure, he may take the examination again within a year, but no third attempts are allowed.

Candidates who are dissatisfied with the decision of the Federal Matriculation Commission may appeal to the Federal Department of the Interior within 14 days, but only 'if such a decision shall have violated a formal provision' of the regulations.

Although general secondary schools are authorized to suspend the teaching of certain subjects during the year or two years preceding the *maturité* examinations, few of them take advantage of this opportunity. In practice, only drawing and geography are dropped before the conclusion of the secondary school course.

General secondary schools preparing pupils for the type B *maturité* examination simply replace Greek by English (this is the case in Catholic secondary schools, in the classical secondary school and the girls' general secondary school of Lausanne, and in some public German-speaking general secondary schools), or give greater importance to the 'real' disciplines.

The general secondary schools of type C, whose forerunners were the so-called industrial schools of the nineteenth century, have retained some links with the past, and often admit pupils at a later age than the other general secondary schools, and after two or three years of upper primary school. It is difficult to lay stress on general culture in this type of general secondary school, which is influenced by the university future awaiting its pupils. It may, however, be said that the humanities (languages, history, philosophy and religion) account for 40–45 per cent of the time-table, and the mathematics-science group accounts for between 31 and 46 per cent (with extremes of 37–56 per cent in the first group and 31–48 per cent in the second).

The content of the courses leading to the various types of *maturité* certificate is shown in the following selection of time-tables.[1]

The examples chosen for type A are those of three public general secondary schools in German-speaking Switzerland —Zürich (6½ years), Basle (8 years) and Frauenfeld (6½ years); two public general secondary schools in French-speaking Switzerland—Neuchâtel (4 years of *progymnase* and 3½ years of *gymnase*) and Geneva (7 years); one Catholic general secondary school—that of the Benedictine Abbey of Einsiedeln (8 years); and one Protestant—that of the Evangelische Lehranstalt of Schiers (Grisons, 7 years). The figures represent the percentage of the total number of hours accorded to each compulsory subject in the curriculum of each general secondary school under consideration.

For type B, the examples given are those of the *Real-gymnasia* of Zürich and of Basle, whose curricula provide the greatest contrast with type A.

The examples for type C refer to the *Oberrealschule* of Zürich, the *Mathematisch-naturwissenschaftliches Gymnasium* of Basle and the *Gymnase scientifique* of Lausanne (with its *progymnase*).

1. Taken from '*Les programmes de l'enseignement du second degré en Suisse*', by Marcel Monnier, a report prepared for the European regional conference on secondary school curricula convened by the French National Commission for Unesco and held at Sèvres in 1958. The author of the present text has frequently consulted Mr. Monnier's report in preparing the section on general secondary schools.

Commercial secondary schools. The commercial secondary schools and the commercial sections of general secondary schools serve both a cultural and a practical purpose. This is defined as follows:

'The aim of the teaching provided in commercial schools shall be to provide pupils with sufficient training for their future occupation, together with a good general culture. Taking its subject-matter from modern culture and economics, the commercial school shall aim at developing logical reasoning, a lively mind and the capacity for clear and correct self-expression. The other tasks of the school are to show pupils the way to intellectual maturity, to make them understand life's duties, to educate their will and to develop their character. The school should awaken and strengthen the pupil's liking for his work and his ambition to reach a higher degree of general and professional culture, even when school has been left behind.'

Commercial schools frequently have a lower division, with courses lasting 2 years (between the ages of 14 and 16) and an upper division, which lasts 3 or 4 years; they comprise two sections, of which one prepares for the diploma, the other for the *maturité* certificate. Whilst the former is of a practical nature and trains its pupils for offices and commerce, the latter aims at a general training which enables its pupils to enter without difficulty the Commercial University of St. Gall, the faculties of schools of higher commercial studies in the other universities and even the faculties of law in certain universities. The distinction between the two sections is, however, not always very clear, since, in some schools, pupils all study in the diploma section before moving into the *maturité* section; on the other hand, in schools where the sections are separated, pupils who have obtained the diploma but who are not accepted into the postal or railway services may be deflected into the *maturité* section.

The commercial school diploma is recognized as equivalent to the Federal Proficiency Certificate (*Certificat fédéral de capacité*) awarded by the commercial professions at the end of the apprenticeship.

In most cases, the diploma section is one year shorter than the *maturité* section (2 years in Zug); in contrast, at Basle and Fribourg, both sections are of the same length: 2 years in the lower division (the commercial school proper) and 4 years in the commercial secondary school—with the special case of Basle, where boys and girls follow separate curricula in the diploma section, and attend mixed classes in the *maturité* section. Although there are federal 'normal curricula', commercial schools utilize the freedom left them in the matter, which explains the differences in curricula from one canton to another.

Nevertheless, comparison between the time-tables of the two German-speaking cantons, two French-speaking cantons and the federal normal curriculum, clearly shows that these differences are minor ones, and it may be said that there is a certain uniformity in the organization of the commercial secondary schools.

Finally, some commercial schools have a special class which prepares for entry into public administrations (the postal, railway, and customs services). This 'administration class' follows the first two years of commercial school. Differences in the curriculum are the following (in Lausanne): no algebra, office practice, commercial law or

TIME-TABLE FOR *MATURITÉ* COURSE IN COMMERCIAL SECONDARY SCHOOLS

commercial economics, less accounting (2 hours instead of 4), but, on the other hand, more arithmetic (4 hours instead of 3), more geography and history (5 and 4 hours respectively instead of 2 and 2).

Group III

Teacher training schools. Teacher training schools train male and female primary school teachers (including infant class teachers and teachers for the classes for retarded children and for direction-finding classes). They are part of the secondary school system.

It may be asked whether teacher training schools should not be classed as vocational schools, since their purpose is clearly to train teachers. They have been classed here as general secondary schools for two reasons: they give their pupils a general education similar to that given in commercial schools; and in some of the cantons they are now simply general secondary schools (e.g., in Neuchâtel and Zürich), vocational training being given in the advanced teacher training institutions. In Geneva and Basle, teacher training schools have merged with the general secondary schools, and the term itself is no longer used; in these two cantons, those who wish to become teachers must hold a *maturité* certificate.

Where the teacher training school is a separate institution, the pupils are admitted at the age of 15 or 16; they are drawn from primary schools, upper primary schools or general secondary schools. Candidates for admission take an entrance examination, the object of which is to select the best pupils (the number of pupils to be admitted is fixed every year according to the needs of the canton or district) and also to ascertain whether they are suited for teaching. For this reason, there is a growing tendency to give psychological tests as well as the usual examinations (in the mother tongue, arithmetic, singing and sometimes drawing).

As to studies, the trend is towards separating their general education from their practical training; in Geneva, Basle, Zürich and Neuchâtel the two are completely separate. The curriculum for the 'educational sections' of a general secondary school or a lower teacher training school is, therefore, the ordinary general secondary school curriculum. Certain special conditions must be complied with before a pupil is admitted to an advanced teacher training institution; he must, for example, pass a psychological test.

There are many teacher training schools which award a teachers' certificate, their curriculum consisting of general educational subjects and vocational subjects, more emphasis being placed on the latter in the last year or two years.

Infant teachers in Switzerland are always thoroughly trained, either in special schools or in a special department of the teacher training school. Girls are admitted at the age of 16 or 17, the entrance requirements being similar to those in teacher training schools. The object of the training is to produce infant teachers who will possess sound judgement, general culture, a thorough knowledge of child psychology, and wide practical experience with children.

Irrelevant to this section is the training of teachers for lower and upper general secondary schools or for commercial schools: all of these hold university degrees. The same is true of upper primary school teachers. In the German-speaking cantons they receive all their training at the university, and in the French-speaking cantons part of it.

Vocational and technical schools

Complementary vocational courses. Towards the end of the last century, trade organizations for arts and crafts, industry and commerce began to systematize training for their employees. The Swiss Arts and Crafts Union arranged training in industry and the crafts, and the Swiss chambers of commerce and junior chambers of commerce for bank clerks and business employees. The cantons assisted by promulgating decrees, in 1884, 1891 and 1895, granting subventions to promote vocational training for youths in industry and commerce, and also to promote training in domestic science for girls. Some towns and cantons set up apprenticeship workshops (to train mechanics), watch-making schools (the first of their kind), industrial art

schools and commercial schools. Entrance to the various trades, however, was mainly through apprenticeship under contract, which was arranged in private firms. So that there should be a single system valid throughout Switzerland, instead of the various cantons having different requirements, the Confederation promulgated the Law of 26 June 1930, which came into force on 1 January 1931; this law 'governs the training required for engaging in handicrafts, industry, transport, commerce and similar occupations'. It is not applicable to agriculture, forestry, fishing, shipping, the fine arts, the sciences, education, or the care of the sick. It states the points to be included in apprenticeship contracts (which are obligatory), defines the duties of both apprentices and the heads of firms, lays down the conditions for the supervision of apprentices, their training, and their qualifying examinations, and prescribes the terms for the award of federal subventions. The cantons are responsible for enforcing the law, under the general direction of the OFIAMT.

The proficiency certificate (*certificat de capacité*) which is awarded to successful candidates at examinations held at the end of the apprenticeship, is a federal certificate, valid throughout Switzerland, but awarded by the canton in which the apprentice has received his training.

At intervals, the OFIAMT publishes a list of the occupations which come under a federal apprenticeship regulation. Another law is being enacted, which will extend the control of apprenticeship by the Confederation to all occupations.

The conditions governing complementary vocational education for apprentices are set out in detailed regulations. Not less than 200 hours' instruction must be given per year and not more than 320, if the training includes instruction in drawing; if drawing is not taught, the minimum is 160 hours and the maximum 240 hours.

The curriculum for industrial training covers 'knowledge of the trade itself' (materials and trade technology) and usually drawing, the mother tongue, ordinary correspondence, computation, book-keeping, civics and the economic system of the country.

The compulsory commercial curriculum includes instruction in the mother tongue, at least one foreign language, business correspondence, applied mathematics, accounting, civics and the economic system of the country; other subjects usually taught are applied law, economic geography, typewriting, shorthand, knowledge of merchandise and sales technique.

Classes must not be held later than 8 p.m. or on Saturdays, Sundays or public holidays; time spent in the classroom counts as part of the apprenticeship period.

Model curricula are issued by the OFIAMT, to help the cantons in their work. They are not compulsory, but serve as a guide for the cantonal authorities whose duty it is to organize vocational training courses. They include advice on the organization of classes, tables and schedules showing the allocation of periods in the complementary courses and in specialized schools, and a detailed curriculum.

Those responsible for organizing courses must keep closely to the federal standards: for example, if the number of hours of instruction in any subject is less than the prescribed minimum, the Confederation is entitled to withdraw the subvention for that subject.

The cantons apply the law and supervise teaching, but they may delegate to large municipalities or professional associations the task of organizing courses. Printers and type-setters associations, for example, are responsible for the complementary training of their apprentices; the Swiss chambers of commerce and junior chambers of commerce organize courses for business apprentices.

The cantons are responsible for ensuring that apprentices in other occupations all have an opportunity to take courses organized for them, and that they attend such courses regularly; where necessary, the canton pays the apprentices' fares. If in any canton, there is no course in a particular occupation the authorities of that canton make arrangements with the authorities of a neighbouring canton to accept their apprentices.

Agriculture. The Federal Law of 3 October 1951 on agriculture deals with vocational training for young peasants, and prescribes a period of not less than two years' apprenticeship under contract, to be organized by the cantons; it recommends continuation classes of 'at least two winter terms for young peasants of both sexes who are not taking any other courses at the same standard'; in these courses, a fixed proportion of the time must be devoted to actual instruction in agriculture by 'technically trained instructors'. The object of these courses is the same as that of specialized schools, i.e. 'to develop general knowledge and interest in peasant traditions, as well as to train the pupils in their chosen vocation'.

The Confederation provides financial assistance for schools and courses. Under the regulations governing all subventions of this type, such assistance must be not more than half the cost of salaries and general teaching equipment.

Domestic science. The Federal Statute of 1 June 1956 lays down the conditions governing domestic science teaching and vocational training for peasant girls. Domestic science (cooking, housekeeping and gardening) may be one of the subjects on the curriculum in the last two years of compulsory schooling. The subjects for continuation courses in domestic science are: cooking, including a knowledge of foodstuffs; food hygiene; housework, including domestic economy; needlework; hygiene, child care and nursing; gardening; household arithmetic and book-keeping; the mother tongue; character training; civics.

Most domestic science schools in country districts have boarding accommodation, and the following additional subjects are studied: market gardening, the use of local agricultural products (particularly baking, spinning and weaving, and the elements of agricultural economy). These schools give courses of at least 18 weeks' duration.

Household apprenticeship in country districts is arranged for girls of 14 and over; a contract must be drawn up in writing for a period of not less than one year. At the end of the apprenticeship there is an examination, organized by the cantons, the papers for which are set by a committee of women. 'No family or household may take in apprentices unless it can guarantee that they will be trained in accordance with the prescriptions and that neither their health nor their morals will be endangered.' The Confederation has no jurisdiction over household apprenticeship in the towns, the responsibility for which devolves entirely upon the cantons.

Schools of agriculture. Most cantons have schools of agriculture. Some take pupils for a period of two years, starting in the spring, and almost all of them admit pupils only if they have reached the age of 17, and have received 'a good primary education'; a year's practical experience on a farm is sometimes required. In most schools, classes are held in winter and practical outdoor courses in summer. Some agriculture schools hold an entrance examination.

The Cantonal School of Agriculture at Marcelin-sur-Morges may be taken as an example. It is divided into three sections—for farmers, for vine-growers, and for viticulturists and orchardists. The school farm has approximately 54 acres of agricultural land (including pasture-land and forests), 9 acres of vineyards and 7 acres of market gardens.

There are a number of schools for peasant girls (*Bäuerinnenschulen*) which provide 5-month courses in both summer and winter for girls aged 16 and over, who have completed their period of compulsory schooling. The curriculum is similar to that of the continuation courses for peasant girls.

There are two cantonal schools of horticulture, one at Niederlenz in Aargau and the other at Châtelaine (Geneva). The latter admits pupils from the age of 15, and the former from the age of 16. Pupils who enter the school at Niederlenz must have done satisfactory work at an upper primary school, and those who enter at Châtelaine must have completed a course at a complementary agricultural school or a *collège moderne.* Courses in both schools are of 3 years' duration; the pupils pay school fees and live in.

Lastly, there are a number of cheese-making schools, which admit pupils from the age of 16 or 17. The course is of one year's duration.

Domestic science boarding schools. In the cantons of Aargau, Berne, Lucerne, St. Gall, Solothurn, Thurgau, Vaud and Zürich, there are resident schools and institutions which offer 5- or 6-month courses in domestic science for girls of 16 or 17. Tuition is free (except in Berne and St. Gall) and all pupils pay a small boarding fee.

Technical schools for women. There are many technical schools for women in Switzerland, some of which are maintained by the cantons and some by private individuals. Pupils are admitted at the age of 14 (to a preparatory class) or—most frequently—at the age of 15. Large numbers of candidates apply for admission, and they must pass a fairly simple entrance examination. School fees are charged.

All offer 3-year courses for dressmakers, most have courses for seamstresses (2½ years), and some, courses in embroidery (2½ years). In Basle-Urban there is a course for saleswomen (2 years) and in Berne a course in weaving (2½ years).

Craft schools and technicums. Most of the so-called craft schools provide compulsory courses for apprentices. These have been described above. Here we are concerned with schools which offer a full-time course of technical or craft training. Admission is between the ages of 15 and 16. In many cases there is an actual apprenticeship contract, and the pupil obtains the Federal Trade Proficiency Certificate after passing the leaving examination.

The technicums have sections to which students of 18 years of age and over who have finished their apprenticeship are admitted. Some have sections both for technicians and for skilled workers.

Entrance to the craft schools or technicums is almost always by examination, the subjects being mother tongue, arithmetic, geometry, drawing and, for engineering schools, algebra. Candidates who can submit satisfactory reports from an upper primary or general secondary school, however, are admitted without examination.

The following table shows the weekly time-tables for two precision engineering schools.

TIME-TABLES FOR TECHNICAL SCHOOLS

Total	44	44	44	44	44	44	44	44

In the watch-making industry, which is highly specialized, a more or less long apprenticeship, ranging from 15 months to 4 years, is required for each skill.

Three-and-a-half years of training are required for the wood industries. The theoretical curriculum is the same for joiners and cabinet-makers, but the practical curriculum for these two trades differs after the first year. The final semester is spent as a probationary period of work at a master joiner's or cabinet-maker's, except for one half-day per week at the school.

Training for the public services. Schools for the training of workers in the major public services, such as the postal and telecommunications service and the federal railways may also be included under the heading of vocational and technical schools.

Other specialized schools

The vocational courses given at the school of hotel management and the conservatories of music (*Musikhochschulen*) are open only to students above the age of 18, and will therefore not be dealt with here. The Ecole Hôteliere de la Société Suisse des Hôteliers, in Lausanne, however, runs a 20-week course in hotel and restaurant duties, including

theory and practice, for students from the age of 17 upwards.

The catering school (*Gastgewerbeschule*) at Zürich takes pupils from 17 years of age and provides a 6-month course in restaurant keeping.

Out-of-class activities

The annual summer excursions known as 'courses', which are organized by all schools throughout the country, can hardly be treated as out-of-class activities; although these outings are, in the senior classes, organized partly or entirely by the pupils, they are still part of the school programme. They last for one day in the junior classes and from two to five or six days in the senior classes.

The ski camps which are now run by all schools are part of the normal school programme.

This is not the case, however, with school clubs and associations. These do not exist in the lower grades of general secondary schools and are rare in the upper grades; usually they are independent of the school. The school regulations explicitly lay down that the authorities can forbid any child to join a club if his work and behaviour in class may suffer as a result. In boarding schools, on the other hand, the children readily form sports, chess and other clubs which remain under the supervision of the school authorities.

At the end of the nineteenth and the beginning of the present century some general secondary schools had a cadet corps which practised military exercises, particularly rifle shooting. Nearly all these institutions have now either disappeared or changed their character. A typical example is that of the Thurgau cantonal school, for which the Order on Cadets of 2 May 1919 lays down that 'specifically military exercises for cadets, in particular company drill and combat exercises, shall be replaced by exercises which are a modified form of compulsory gymnastics and are an extension of this by means of a modern physical education'. Little remains of the former military exercises in many schools except brass bands and shooting matches.

TRENDS AND PROBLEMS

Swiss secondary education is passing through a period of transition, and this makes it more difficult than usual to present a clear picture. Many cantons are preparing new legislation on education which will alter the very structure of their educational system. The reason is that the whole problem of training the young is being called in question by the rapid advance of science. A polite but intensive struggle is being waged between the humanists and those who support a basically modern type of education biased towards foreign languages, technology and science. This problem is particularly important in Switzerland. A further complicating factor is the pressure of the school population on the general secondary schools, where the problems of curriculum planning, teacher training and vocational guidance are becoming acute.

Further, it is clear that efforts are being made to co-ordinate the curricula of the lower secondary schools so as to allow pupils to transfer from one section to another without too much difficulty.

Apart from these general problems, some cantons have problems of their own. Aargau, Basle and Zürich are planning to extend compulsory schooling to nine years and to use the ninth year for a pre-vocational class. Ticino is hoping to expand its vocational school. Valais is working towards a longer period of schooling. The canton of Basle-Rural is trying to remodel the general secondary school by dividing it into five sections.

All this indicates a lively desire to keep up with the times by giving children educational opportunities to develop their specific abilities, so that they may more easily find their place in the world of today.

These concerns, however, do not mean that the prime purpose of all education is being relegated to the background. This purpose is well expressed in the introduction to the primary school syllabus for the canton of Appenzell (Outer Rhoden), which can be equally well applied to all secondary education: 'The aim of the people's schools is to educate the child, in co-operation with the parents, so as to produce a well-balanced, sturdy personality of strong will and stable character. The school must therefore concern itself with training the human being as a whole. A strong and virtuous character, a clear mind and a healthy body are the elements of a vigorous personality. Learning must not be an end in itself but a means of training the judgement and educating the memory so as to produce a rounded intelligence.'

[*Text prepared in August 1959 by Georges Chevallaz, formerly director of the Ecole Normale of the Canton of Vaud, and transmitted by the Swiss National Commission for Unesco.*]

STATISTICS

Population (mid-year 1958 estimate): 5,185,000.
Area: 15,941 square miles; 41,288 square kilometres.
Population density: 325 per square mile; 126 per square kilometre.

Summary of school statistics, 1953–1957. Data are generally available only for public schools and are incomplete for some years and certain levels of education.

Total enrolment in 1956/57 in all public educational

institutions, excluding teacher training courses, was about 727,000. Of this total, 77 per cent were in primary and special schools, 17 per cent in general secondary schools, 4 per cent in vocational schools and 2 per cent at university level. Girls made up almost half the enrolment at primary and general secondary schools, but only 15 per cent at university level institutions. The full-time teaching staff in primary and general secondary schools numbered 26,438, of whom 46 per cent were women. University staff numbered 2,195 in 1957/58, an increase of 13 per cent over 1953/54. The pupil-teacher ratio in public primary schools was 27 in 1956/57 and 22 in public secondary schools, excluding part-time staff. Compared with 1953/54, enrolment in 1956/57 had increased by 7 per cent in primary, by 28 per cent in general secondary and by 5 per cent in university level institutions. (See Table.)

Examination results in secondary education, 1957/58. The only data available refer to diplomas granted in secondary technical education (technicum diploma) which numbered 751 in 1957/58, an increase of 22 per cent on diplomas awarded in 1955/56.

Educational finance, 1957. The estimated total for recurring expenditure only during the fiscal year beginning January 1957 was 776.2 million Swiss Francs. No breakdown of this sum by level and type of education is available. Official exchange rate: 1 Swiss franc = 0.233 U.S. dollar.

Note. The above table refers to public schools only unless otherwise indicated.

1. In addition there were 1,231 part-time teachers.
2. In addition there were 1,040 part-time teachers.
3. There were in addition two private evening technical schools, enrolment 1,272, in 1957–58.
4. Including pupils in some private schools.
5. Schools and teachers of the primary schools.

THAILAND

THE EDUCATIONAL SYSTEM

The main statutory provisions governing education in Thailand are the Primary Education Act (1935), the Private School Acts (1937 and 1940) and the National Plan of Education (1951). They may be summed up as follows.

Every individual shall enjoy absolute freedom in education so far as is consistent with the educational laws and public safety.

Every child who has reached the age of 7 plus must attend a primary school up to the age of 14 plus unless he or she has passed the final examination of the *Prathom* Course (4 years primary education) of the Ministry of Education or another syllabus approved as equivalent.

It is the duty of the State to promote and foster education. All educational institutions are under the control of the Government. Universities and colleges may organize and administer their own courses within the limits of the law.

In establishing schools and institutions, the State employs the principle of division of labour, that is, the Government will establish a certain number of schools, and will allow individuals or groups of individuals to establish the balance of schools below college level.

The State shall give scholarships to encourage deserving students.

The State takes responsibility for organizing teacher training with a view to supplying various institutions with qualified teachers.

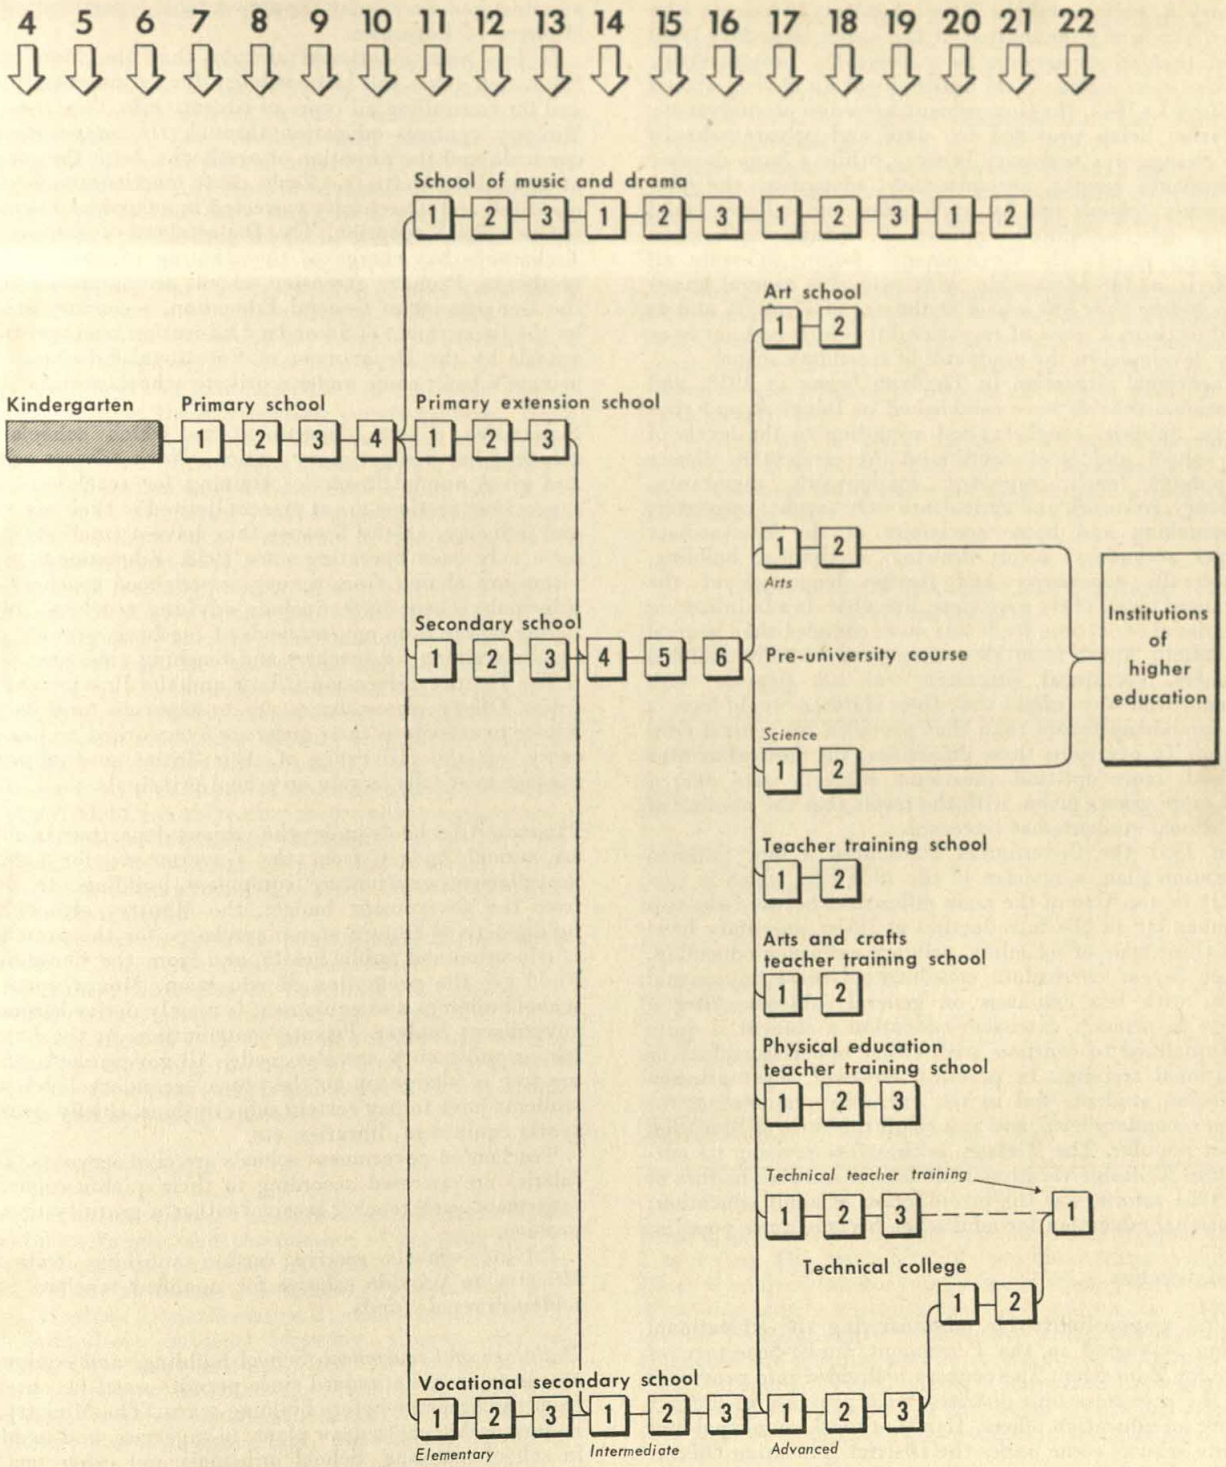
The State has the power and responsibility to control, advise, and supervise activities in all schools, and to hold examinations at all levels as provided by the regulations of the Ministry of Education.

Education is organized at the following levels:

1. Kindergarten or pre-primary education provides training for children prior to compulsory education, to prepare them for education in the primary school.
2. Primary education provides fundamental knowledge and covers a period of 4 years.
3. Secondary education is divided into three branches, namely: (a) post-primary education, which is a continuation of the work of the primary school plus basic studies relative to citizenship and covers a period of 3 years; (b) directed secondary education, which provides a foundation for further study and vocational training and covers a period of 3 years at lower level and 3 at upper level; (c) vocational secondary education, which provides training in fundamental vocational knowledge and skills and may be begun after primary, post-primary or directed secondary education. There are two levels, lower and upper (referred to as elementary and intermediate vocational education), each level covering a period of 3 years.
4. Pre-university education which provides a foundation for education in universities, colleges, or higher vocational institutes and covers a period of 2 years.
5. Advanced vocational education which provides an extension of vocational secondary education to increase earning capacity, and a background for training at the university and college levels.
6. College and university education which is provided at five institutions for higher learning and research.

The structure of the school system is shown in the diagram on page 1071.

DEVELOPMENT OF SECONDARY EDUCATION



Statutory provision for education in Thailand dates from 1898. Education was then of two types: 'general', involving the study of such subjects as the Thai language, foreign languages, mathematics, ethics, and civics; and 'special', including the study of special optional subjects, according to the interests and aptitudes of students. Development and improvement continued until 1913, when an education plan was introduced which provided for 8 years of general secondary education based on the first 3 years of a 5-year primary school, and led to special education and the university.

In 1915 an 8-year secondary course was provided for special education, both general and special secondary education being divided into three cycles. In 1928 a new curriculum was devised for the third secondary cycle which was divided into a 'neutral' section, comprising general subjects as in the former curriculum, a language section which limited work in other subjects, and a science section. Students were allowed to choose any section, according to their aptitudes, and with a view to the usefulness of their studies in their future careers. After five years' trial, the neutral section was abolished.

The Revolution of 1932 turned Thailand into a constitutional monarchy, based on democratic principles. One of these principles was universal general education. An Educational Council was set up to prepare a national plan of education, which was revised in 1936. The plan was as follows.

After completing the 4-year primary school, which was made compulsory, students might continue at either the lower general secondary or lower vocational secondary level. These led to either the upper general or upper vocational secondary level. From either of these they could enter the pre-university level. Students who preferred vocational training could continue their advanced studies in a technical school.

Secondary education was provided in government and private schools. Pre-university education was arranged by universities and colleges; for example, Chulalongkorn University had its own pre-university course, as did Thammasat University, the University of Agriculture, the

Military Academy and the Naval Academy. Students who passed the final examination at the upper secondary level would themselves arrange to undergo the pre-university entrance examination of the university at which they wished to study. In 1941, the Government agreed to pre-university education being provided by state and private schools. This change was necessary because, while a large number of students sought pre-university education, the pre-university schools run by universities and colleges could accept only a limited number of entrants each year. Moreover it was the Government's policy to equip all children, as far as possible, with extensive general knowledge before they left school at the age of 17 or 18, and to instil in them a sense of responsibility which had not been fully developed in the graduates of secondary school.

Vocational education in Thailand began in 1913, and vocational schools were established in Bangkok and elsewhere. Subjects taught varied according to the levels of the school and local conditions. At elementary (lower secondary) level, carpentry, leatherwork, metalwork, masonry, ironwork and agriculture were taught; carpentry, dressmaking and home economics at the intermediate (upper secondary) level; drawing, mechanics, building, housecraft, commerce, and foreign languages at the advanced level. There were more difficulties in administering vocational education, for it was more complex than general education. Apart from the scarcity of suitably-qualified teachers, vocational education was not popular with parents who were afraid that their children would have a less promising future than that provided by general education. To overcome these difficulties, the curriculum was revised, more optional vocational subjects were offered and more grants given, with the result that the number of vocational students has increased.

In 1951 the Government introduced a new national education plan, a revision of the 1936 one, which is currently in use. One of the main differences between the two schemes lay in the introduction at lower secondary level of a third type of schooling, primary extension education, whose 3-year curriculum concentrated more on manual skills, with less emphasis on general subjects. After a course in primary extension education a student is quite well qualified to continue with either upper secondary or vocational training. In practice, however, most primary extension students fail in the entrance examination for upper secondary level, and as a result this form of education is not popular. The Ministry is therefore revising its curriculum for lower vocational education. Another feature of the 1951 reform was the introduction of adult education; vocational education for adults has become quite popular.

Administration

General responsibility for administering the educational system is vested in the Permanent Under-Secretary of State for Education. The country is divided into provinces and the provinces into districts, each province or district having an education officer. Heads of local, municipal and private schools come under the District Education Officer, and heads of government schools or colleges under the Provincial Education Officer. In the central region, however, all schools and colleges, government and private, are administered directly by the appropriate department of the Ministry of Education.

It has been mentioned already that the Ministry of Education takes full responsibility for formulating policy and for controlling all types of education in Thailand. The Ministry controls education through the preparation of curricula and the provision of textbooks, both the concern of special committees. Each draft curriculum is fully discussed and if necessary corrected in a curricular seminar before official adoption. The Department of Educational Techniques has charge of the printing of curricula and textbooks. Primary extension schools are administered by the Department of General Education, secondary schools by the Department of Secondary Education, and vocational schools by the Department of Vocational Education. All private schools come under a private schools section.

Supervision. Every department to which schools are attached has a supervisory section, which advises schools and gives annual in-service training for teachers. These supervisory sections are at present limited in their activities and influence, chiefly because they have a small staff and have only been operating since 1953. Educational supervisors are chosen from among experienced teachers and principals. Their duties include advising teachers, undertaking research on new methods of teaching, providing in-service training for teachers and teaching aids, etc.

The District Education Officer and the Provincial Education Officer whose duties are to supervise and to give advice to schools in their areas are overworked and cannot carry out the full range of their duties so that school management falls largely on school principals.

Finance. All schools under the various departments obtain an annual budget from the Government for salaries, miscellaneous expenditure, equipment, building, etc. Apart from the government budget, the Ministry also obtains funds, derived from a stamp surcharge for the promotion of education and public health, and from the Counterpart Fund for the promotion of education. Money spent on school buildings and equipment is mostly derived from the government budget. Private contributions in the form of labour and money are also made. All government schools are free of charge up to the upper secondary level when students have to pay certain subscriptions, chiefly spent on sports equipment, libraries, etc.

Teachers in government schools are civil servants. Their salaries are assessed according to their qualifications. On retirement each teacher receives either a gratuity or a life pension.

Private schools receive certain subsidies from the Ministry to provide salaries for qualified teachers or to replenish repair funds.

Buildings and equipment. School buildings and equipment are more or less standard since permits must be obtained from the Ministry before building starts. The Ministry has its own architects to draw plans, to supervise, and to advise in school planning. School principals and other teachers are responsible for ensuring proper school sanitation. Most school buildings are in good condition, because the Government builds schools to serve as models for private schools.

TYPES OF SECONDARY EDUCATION

When a student has completed his primary education he may continue in one of the following government schools: primary extension school, lower secondary school or vocational school. Each student must pass an entrance examination, as only a limited number of applicants can be accepted each year. Any student who fails in the secondary entrance examination may study in a private school of similar type or a coaching school in order to prepare himself for the public examination for the certificate of lower secondary (*Matayom* 3 Certificate), upper secondary (*Matayom* 6 Certificate) or pre-university education.

Students who have successfully completed the first part of secondary education (a 3-year course) at a lower general secondary school can graduate either to the upper general secondary level or the intermediate vocational level. Those who have attended a primary extension school have similar alternatives. But those going from primary school to vocational education can continue their studies only at the intermediate vocational level. After upper general secondary education, students may continue at pre-university or advanced vocational level.

The general secondary course offers a better opportunity and a wider choice for further study at a higher level, and it is not surprising therefore that students prefer this to the vocational line. In view of this and also of the fact that the student in the lower vocational school, immature mentally and physically, cannot derive maximum benefit from vocational study, the Ministry intends to revise the curriculum of secondary education. It is considered preferable to have only one type of lower secondary education, so that a student can thereafter choose either a general or a vocational course at upper secondary level. The new curriculum will be well balanced so that students of both lines will have a similar chance to study important subjects related to their work.

All schools have adopted the same school year, as follows: first term, 17 May to 23 August; second term, 1 September to 1 December; third term, 11 December to 16 March.

Formerly every school had a six-day week, but in 1958 schools were allowed to open five or six days per week as they saw fit. However, the hours of study must total 33 per week for vocational schools and 30 per week for primary extension and secondary schools.

General secondary schools

Primary extension schools. These are all government schools. The subjects taught and the number of teaching periods allotted to each are the same for each year of the 3-year course and are as follows: *Compulsory*—social studies, 4; Thai, 4; English, 2; mathematics, 3; elementary science, 2; other compulsory subjects (drawing, singing, physical education, Boy Scout or Junior Red Cross activities, elementary carpentry or domestic science), 9. *Optional*—(metalwork, creative handicraft, machine shop, sewing, embroidery, practical agriculture, weaving), 6; total, 30.

Secondary schools. These may be either government or private schools.

Lower secondary: a 3-year course after primary education. The subjects taught and the number of teaching periods allotted to each are the same in each year and are as follows: social studies, 4; Thai, 6; English, 6; mathematics, 4; elementary science, 3; hygiene, 1; drawing, 1; singing and practical work, 3; physical education and Boy Scout or Junior Red Cross activities, 2; total, 30.

Upper secondary: a 3-year course after the lower secondary level. The subjects taught and time-allotment are the same for each year of the course and are as follows: social studies, 5; Thai, 5; English, 6; mathematics, 6; general science, 3; drawing, 1; practical work, 2; physical education and Boy Scout or Junior Red Cross activities, 2; total, 30. The students who complete this level of education (*Matayom* 6) are qualified to study at pre-university level or advanced vocational level. They also possess the minimum qualification for employment as a clerk, the lowest grade in the Civil Service.

Pre-university: a 2-year course after upper secondary education. It is sub-divided into two sections, arts and science, and the study hours for each subject are shown in the following table.

TIME-TABLE OF PRE-UNIVERSITY COURSE
(in hours per week)

Subject	Arts		Science	
	1st year	2nd year	1st year	2nd year

General science I	4	4	–	–
General science II	–	4	–	–
Secretarial course	3	3	3	3

Evening private schools. This type of school is open from 2 to 9 p.m. The hours of study are about three per day. There is no fixed rule for total hours of study per week, this depending largely on the school itself and on the subjects taught. Evening school work mostly comprises lessons in languages and coaching for the examinations of *Matayom* 3, *Matayom* 6, and of Pre-University. Many students registered at this kind of school are full-time students of other schools who wish to undertake extra studies in the evening.

Each secondary school organizes its own examinations and has the right to pass its students at all grades, with the exception of *Matayom 3*, *Matayom 6* and Pre-University

examinations which are public or state examinations organized by the Ministry itself.

Teachers must have at least a Teaching Certificate in Primary Education or its equivalent. But this regulation naturally does not extend to private schools. Most qualified teachers are graduates of teacher training schools, or hold teaching certificates awarded by the Ministry which arranges a special examination for teachers each year.

Vocational and technical schools

There are three types of vocational schools: those run by the Department of Vocational Education at the Ministry of Education; those run by other ministries for training staff according to their needs; and private vocational schools.

Vocational schools of the Ministry of Education. Vocational schools in this category offer the following subjects: carpentry, commerce, agriculture, building, leatherwork, mechanics, dressmaking, shipbuilding, weaving, metalwork, hairdressing, languages, painting, sculpture, carving, block-making, metal ornaments and jewellery making, etc. Time-tables for a few vocational schools are as follows:

For Certificate in Vocational Education, elementary level. Women's course: 2 years of study after primary education. Subjects and time-allotment identical in each year of course: civic duties and ethics, 1; Thai, 2; English, 2; arithmetic and book-keeping, 2; drawing, 2; physical education, 1; dressmaking—clothes for women and children, 6; clothes for men, 3; needlework, 6; flower arrangement, 2; cooking, 3; total, 30. *Carpentry:* 3 years of study after primary education. Subjects and time-allotment for each year of course are: civic duties and ethics, 1; Thai, 2; English, 2; arithmetic and book-keeping, 2; physical education, 1; carpentry, 19 first year, 17 second year, 16 third year; mechanical drawing, 3; free-hand drawing, 2 each in second and third years; cost estimation (taught in third year only), 1; total 30.

For Certificate in Vocational Education, intermediate level. Women's course: 3-year course after obtaining Certificate in Vocational Education, elementary level, or completing primary extension or lower secondary education. Subjects and study periods per week identical in each year of course: civic duties and ethics, 1; Thai, 2; English, 2; mathematics and book-keeping, 2; drawing, 2; physical training, 1; dressmaking—clothes for women and children, 6; clothes for men, 3; needlework, 6; optional subjects, 2; flower arrangement, 3; total, 30. *Building, carpentry:* 3-year course after obtaining a Certificate in Vocational Education, elementary level, or passing primary extension or lower secondary level. Subjects and time-allotment are the same as in the carpentry course at elementary level.

For Certificate in Vocational Education, advanced level. Carpentry and building: 3-year course after obtaining a Certificate in Vocational Education, intermediate level, in building and carpentry. Subjects taught and weekly time-allotment in each year of the course are: civic duties and ethics, 1; Thai, 2; English, 4 in first year, 3 in second and third years; mathematics and book-keeping, as for English; physical education, 1; principles of construction, 2; cost estimation, taught in second and third years only, 2 periods per week; drawing, 6; practical work, 10; total, 30.

Curricula for other vocational courses are based on these models.

Technical College. Two types of students are qualified to enter the Technical College: those who have gained *Matayom* 6 Certificate can take a 3-year course in printing, photography, carpentry or surveying; those who hold the Certificate in Vocational Education, advanced level, can take a 2-year course in building, metalwork, mechanics, electricity, radio, accountancy, secretarial work, dress-making, dress-designing, or dietetics.

When they have finished this level, students who wish to be teachers may take a 1-year course in teacher training. Only technical subjects are taught in the departments which admit students with the advanced vocational certificate. In the departments which offer courses in printing, photography or surveying, general subjects are also taught as in any advanced vocational school. The Technical College is a new institute, at present operating on temporary syllabuses.

Vocational schools run by other ministries. This group includes schools for the following careers: Posts and Telegraphs, railway engineering, nursing, mapping, and aeronautical engineering. Their syllabuses are issued by the ministries concerned. Schools of this kind accept only students holding the *Matayom* 6 Certificate, with the exception of the Practical Chemistry School, which admits only those with the Pre-University Certificate.

Private vocational schools. This type of school usually gives short courses: in typing, shorthand, accountancy, radio, television, mechanics, printing, building, hairdressing, dressmaking, or driving. Each has its own syllabus, but must have permission to operate from the Ministry of Education.

Teacher training schools

There are two kinds of teacher training schools at secondary level which prepare teachers for primary school teaching: for general teacher training; and for vocational teacher training. Both types are controlled by the Department of Teacher Training and both offer a 2-year course. An entrance examination and examinations on completion of each subject are obligatory.

Subjects taught in general teaching training schools are social science, science, language arts, mathematics, fine arts (Thai and occidental), health, physical education, handicrafts, drama and public speaking, education and psychology, and either home-making or practical agriculture.

In vocational teacher training the courses in both boys' and girls' schools include geography (general), physical geography of Thailand, government and civic duties, Thai culture and etiquette, recreational activities, health and safety education, languages (Thai and English), mathematics and book-keeping, education and psychology, and teaching practice. The course for boys also offers instruction in principles of construction and carpentry, designing and drawing, sketching, cost estimation, and building materials; girls learn drawing, dressmaking, needlework, dietetics and various crafts.

There are two other teacher training schools—the Art and Crafts School and the Health and Physical Education School, both co-educational.

The Arts and Crafts School, controlled by the Department of Vocational Education, provides 3 years of study after *Matayom* 6. The following subjects are taught: theoretical—Thai, English, general knowledge of art, education and psychology; practical (compulsory)—traditional portrait painting, figure drawing, animal drawing, landscape painting, composition, decoration; practical (optional)—woodwork, bamboo-craft, metalwork, pottery, weaving-patterns by dyeing, lacquer-work.

The Health and Physical Education School, controlled by the Department of Physical Education, offers a 2-year course after *Matayom* 6 and subjects include Thai, English, social studies, hygiene, physical education, education.

Other specialized schools

The Art School, under the Department of Fine Arts, has a 2-year course after *Matayom* 6, serving also as a preparatory school for further study at university level. It has two sections—one for painting and modelling, and the other for archaeology. The former offers Thai, English, mathematics, as general subjects, and modelling, architecture, Thai interior decoration, projection, perspective, research in Thai art and history of art, theory of colour, drawing, painting, composition, interior decoration, anatomy, as technical subjects. The archaeology section offers Thai, English, French, Pali, history (Thai and European), as general subjects, and archaeology, oriental art, occidental art, Thai history, religion, culture, drawing, planning, Thai decoration, as technical subjects.

The School for Classical Dancing, Drama and Music is controlled by the Department of Fine Arts and accepts young students after primary education. It is divided into four successive courses. The weekly time-tables for the various courses are as follows; unless otherwise stated the subjects taught in any particular course and the time-allotment per subject are the same in each year.

Elementary level, lower class (3-year course): social studies, 3; Thai, 4; English, 4; mathematics, 4; hygiene, handicrafts and drawing, 3; singing, 2; classical dance, 10.

Elementary level, higher class (3-year course): social studies, 4; Thai, 5; English, 5; arts and crafts, drawing and singing, 1; musical theory, 2; art theory, 1; classical dance, 10.

Intermediate level (3-year course): professional ethics, 1; Thai, 6; English, 6; drawing, 1; musical theory, 2; art theory, 1; Thai classical dance, 7 or 6; Thai classical music, 6 or 7; education and psychology (third year only), 8. Third-year students devote one term to teaching practice and two terms to study.

Advanced level (2-year course): professional ethics, 1; Thai, 4; English, 6; Thai classical dance, 8 or 6; Thai classical music, 6 or 8; education and psychology, 5.

Out-of-class activities

In every type of school, students play an active part in school life by participating in student councils and student committees, outdoor and indoor games, school celebrations, athletic competitions and other activities.

TRENDS AND PROBLEMS

Over 405,000 students complete primary education every year and all are eager to continue their studies at a higher level. Secondary schools all over the country are faced with this urgent demand. Every government school has had to adopt a two-shift system and students take turns to come to school for lessons. At the same time the Ministry is increasing the number of secondary schools and trying to enlarge most of the existing ones, so that more students can be accepted and the two-shift system abolished. Despite great efforts, the problem is not yet solved, mainly because of limits imposed by the national budget. The Ministry is also seeking to deal with this problem by encouraging people to take an active part in the management and development of local education.

The increased number of students has led to a grave shortage of teachers. In order to solve the immediate problem, the syllabus of the teacher training school for primary education has been reduced temporarily from three to two years. The Ministry is well aware that a student with a *Matayom* 6 Certificate and two years in teacher training is still immature and cannot be a well qualified teacher.

Most institutions of higher education are in Bangkok. Students from the provinces flock to the capital for higher education, creating a serious problem of overcrowding in colleges or universities. The Ministry therefore initiated a Regional Education Development Project in 1958, which provides for the establishment of institutes of higher education in all 12 provinces.

There is a lack of co-ordination in the curricula for secondary education. The Ministry recently appointed a committee to revise the curricula at all educational levels, and to devise a master plan. Revised curricula for the primary, secondary, pre-university and advanced vocational levels are now in operation for a trial period.

Normally students can complete a primary course in four years, usually at an age when they are too young to earn a living. The Ministry plans to extend compulsory education from four to seven years. The educational ladder will then follow a 7+3+2 pattern, for primary, secondary and higher secondary education respectively.

STATISTICS

Population (mid-year 1958 estimate): 21,474,000.
Area: 198,456 square miles; 514,000 square kilometres.
Population density: 108 per square mile; 42 per square kilometre.

Summary of school statistics, 1953–57. Total enrolment in full-time educational institutions at all levels was 3,744,262 pupils in 1957, representing approximately 17 per cent of the total population. There were in addition some 33,300 people attending adult education courses. Of total enrolment, over 87 per cent were in pre-primary and primary schools, nearly 10 per cent in general secondary schools, under 2 per cent in secondary technical schools and just over 1 per cent in higher teacher training courses and universities.

The proportion of girls was 47 per cent in primary schools in 1957 compared with 44 per cent in 1953, and 35 per cent in general secondary schools against 31 per cent at the beginning of the period under review. Girls made up 47 per cent of enrolment in post-secondary teacher training courses and 24 per cent at the universities. The number of teachers at all educational institutions from primary to university level was over 112,000 in 1957 of whom 30 per cent were women. Compared with 1953, the number of primary school teachers increased by 9 per cent and the average pupil-teacher ratio was 35 in 1957 against 36 in 1953. In general secondary schools, although the teaching staff increased by nearly 56 per cent, the pupil-teacher ratio was 28 in 1957 compared with 24 in 1953. Enrolment increased at all levels of education during the period under review: by 7 per cent in primary schools, 80 per cent in general secondary schools, 341 per cent in teacher training colleges and 5 per cent in the universities. The exceptional increase in enrolment in teacher training colleges is explained by the cessation of teacher training schools (secondary level) in 1955 and the subsequent expansion of higher teacher training courses. (See Table 1.)

Enrolment trends in secondary education, 1930–57. From 1930 to 1957 the estimated child population 15–19 years old more than doubled. Over the same period, however, average total enrolment of children attending general secondary schools increased from 33,000 in 1930–34 to 331,000 in 1955–57. The proportion of girls has steadily increased from 20 to 35 per cent of total enrolment in general secondary schools. The number of students attending technical schools has also risen spectacularly over the last 20 years. Teacher training at secondary level ceased in 1955 and enrolment data are not available before 1940.

The secondary enrolment ratio has steadily improved since 1930 with the exception of the immediate post-war years 1945–49. This ratio stood at 15 in the three-year period 1955–57 compared with only 3 in the years 1930–34. (See Table 2.)

Examination results in secondary education, 1953–57. The number of students awarded the general certificate more than doubled between 1953/54 and 1957/58 and the number of girls increased by 147 per cent over the same period. Vocational certificates, at different levels, were obtained by 9,634 students in 1957/58, three times more than in 1953/54. (See Table 3.)

Educational finance, 1957. Total expenditure on education in 1957 (fiscal year beginning January) was 1,032,962,000 baht, representing about 49 baht per inhabitant. The principal sources of funds, apart from the central government budget, were a postage stamp surcharge and counterpart funds from United States aid. Together these contributed about 9 per cent of total receipts. Capital expenditure amounted to 170,000 baht, or about 16 per cent of the total spent. (See Table 4.)

TOGO

THE EDUCATIONAL SYSTEM

Owing to the trusteeship which France exercised over Togo, the educational system of the latter country follows the French pattern. The fundamental text governing the entire system is Order No. 32/E of 18 January 1935. Togo's accession to independence and the rapid expansion of education during recent years have now made it necessary to revise the educational laws.

The Ministry of National Education directly administers public secondary schools and exercises a control over private schools. The relations between the State and private education are defined by Order No. 655/E of 30 November 1943. New regulations are under consideration. The Ministry of National Education grants or refuses authorization to teach or to open schools, and allocates subventions.

In Togo, education comprises primary education, which lasts 6 years and leads to the primary certificate (*certificat d'études primaires*—CEP), and secondary education, which is open to children who, after completing the 6-year primary course, pass a competitive examination. Secondary education is given at the following establishments: schools providing continuation courses (*cours complémentaires*), leading to the lower secondary school certificate (*brevet*) after 4 years' study; *collèges* and *lycées*, leading to the *baccalauréat* after 7 years' study; a technical school, which provides a 4-year course leading to the vocational proficiency certificate (*certificat d'aptitude professionnelle*—CAP).

THE DEVELOPMENT OF SECONDARY EDUCATION

Secondary education dates from 1920, when a 2-year *cours complémentaire*, later extended to 3 years, was begun at Lomé. The best pupils were sent on to schools in French West Africa. It was only after the second world war that secondary education proper was introduced into Togo. In 1950, the *lycée* at Lomé prepared pupils for the *baccalauréat* for the first time.

Administration

Secondary education is at present governed by Order No. 160/E of 23 February 1950. A new text is now being prepared.

Under the general control of the Minister, the Director of Education, assisted by an advisory committee, is responsible for the organization of secondary education. He exercises direct control over public secondary schools and supervises them from the standpoint of administration and teaching. He may also inspect private secondary schools.

The services of inspectors-general of the French Ministry of National Education are enlisted, particularly for the supervision of French officials temporarily serving in the Republic of Togo.

The head of each school is assisted by a board of management.

Public schools are owned by the State and financed out of the general budget. Education is free of charge and funds are assigned to each educational establishment for equipment and scholarships. Teachers' salaries are paid by the Finance Service.

Private secondary schools also receive a quarterly subvention for staff and equipment. Pupils of private schools may be awarded scholarships under the same conditions as pupils of public schools.

The School Medical Inspectorate keeps a check on the health of teachers and pupils.

TYPES OF SECONDARY EDUCATION

Secondary schools in Togo provide full-time courses. On the basis of an examination and of a report by their respective headmasters, and with due regard to their aptitudes, primary school leavers are considered by the commission specially set up for that purpose and are directed towards the 'long course' (*enseignement long*) provided in *lycées* or *collèges*, or towards the 'short course' (*enseignement court*) of the *cours complémentaires*, or towards technical education.

This orientation can be modified during the pupil's studies, on the proposal of the teachers' council.

The school year begins on 1 October and ends on 30 June. It comprises three terms, separated in December and March by holidays lasting from 10 days to a fortnight. Class lessons are given every morning, the afternoons being reserved for supervised studies, sport and art education.

General secondary schools

General secondary education is given at schools providing the long course or the short course.

Secondary schools providing the long course. There are four schools in this category: the *lycée* at Lomé and the *collège classique et moderne* at Sokodé, and two private schools (Catholic) at Lomé—the Collège St. Joseph and the Institution Notre-Dame des Apôtres (for girls). These schools provide teaching which gives the most gifted pupils access to higher education.

The subjects taught include French, moral instruction, civics, Latin, Greek, history, geography, modern languages (English, German and Spanish), mathematics, natural sciences, physics and chemistry (classes of the second cycle), philosophy (terminal classes), physical education, drawing and music. Pupils are classed in order of merit every three months and are promoted at the end of the year if their yearly average is equal to at least 10 out of 20.

They are admitted to the terminal classes after they have passed the first part of the *baccalauréat;* they can then opt for either philosophy, experimental sciences, or mathematics. Success in the second part of the *baccalauréat* enables them to undertake higher studies abroad.

Teachers employ the active methods which are advocated by the Inspectorate-General of the French Ministry of National Education. They are recruited from among university graduates (*agrégés*, holders of diplomas, holders of the *licence*). Staff regulations for Togo teachers are now under consideration.

Secondary schools providing short courses (*cours complémentaires*). There are eight schools of this category, including five public schools (at Vogan, Palimé, Kouméa, Bassari and Dapango), two Catholic schools (at Tsévié and Lama-Kara), and one Evangelical school (at Lomé). Their task is to train middle-ranking staff for the public service or private firms.

At the end of their studies (4 years), pupils sit for the examinations for the *brevet élémentaire*, or the *brevet d'études du premier cycle.* The best of them are then admitted, on the proposal of the teachers' councils, to schools providing the long course; some of them are directed towards the vocational training schools which, with the exception of the teacher training schools and the Togo School of Administration, are situated abroad; the others immediately find employment, without having to comply with any formality or pass an examination or a competitive test.

The *cours complémentaires* comprise only one section, in which instruction is given in the same subjects as are taught in the modern sections of the schools providing 'long courses' (first cycle) but only one modern language (English) is taught.

The methods of recruiting and selecting pupils and the teaching methods are the same as those applied in the schools providing long courses.

The teaching staff is recruited from among teachers holding the *baccalauréat* or the *licence.* In general, the members of this staff have received a year's professional training.

Vocational and technical schools

Owing to the present economic situation of Togo, there is only one vocational and technical school at the secondary level, a *centre d'apprentissage* which is situated at Sokodé

and called the Vocational School of Commerce and Industry (Ecole Professionnelle de Commerce et d'Industrie–EPCI).

As in the general secondary schools, an examination is organized every year for the recruitment of the pupils of the EPCI. During the first year all pupils take the same course; in the following year they are distributed according to their aptitudes among the various sections, where they receive a general education as well as theoretical and practical vocational training. The school comprises industrial sections (fitting, auto mechanics, electricity, carpentry, masonry) and commercial sections (shorthand and typing, book-keeping).

The course lasts 4 years and leads to the *certificat d'aptitude professionnelle.* The best pupils are awarded scholarships to enable them to continue their studies at technical schools or colleges abroad. The others can obtain immediate employment in the field of work which they have chosen.

Teachers of general subjects are recruited from among holders of the *baccalauréat;* those entrusted with technical teaching have been trained in France.

Teacher training schools

There are two teacher training schools, one public and the other Catholic. The latter (Ecole Normale Catholique de Togoville) is subordinate to the Directorate of Catholic Education, but is supervised by the Directorate of Public Education. It is run on similar lines to those of the public teacher training school.

The public teacher training school of Atakpamé was reorganized by Order No. 206/PM-MEN of 25 October 1958 and it now provides a 4-year complementary course. This is followed by a year's teacher training proper, for which the syllabuses were laid down by Order No. 10/MEN of 6 November 1958.

Pupils of the teacher training section are recruited by competitive examination among candidates holding the *brevet élémentaire* or the *brevet d'études du premier cycle.* After a year's professional training, they sit for the examination for the teacher training certificate (*certificat de fin d'études normales*); successful candidates are appointed on probation; after a year's probation, in order to receive a permanent appointment they must pass the practical and oral examinations for the elementary teacher's certificate (*certificat élémentaire d'aptitude pédagogique*).

The teaching staff is recruited from among teachers holding the *baccalauréat* and teachers of secondary schools providing the long course.

Out-of-class activities

Sports occupy an important place in school activities; they include, in particular, athletics, football, basket-ball and volley-ball. In addition to the national championships, competitions are organized with school teams from the neighbouring countries, particularly Dahomey. Some schools also organize choral and dramatic activities.

Efforts are also made to interest pupils in school government. Thus, at the *lycée* at Lomé, discipline is maintained by the pupils themselves. The pupils responsible for this task report to the headmaster every Sunday on the week's activities and indicate improvements which could be made. They are consulted on any changes to be made in the boarding-school system.

TRENDS AND PROBLEMS

The most important problem is naturally that of the expansion of secondary education, which is hindered by the limited nature of the Togo budget. However, the establishment of a new *lycée* better adapted to the needs of modern education is envisaged.

Another problem is that of girls' education. Owing to the very important social role which African women are called upon to play, it is essential to make secondary education accessible to as many girls as possible and to adapt education to their future tasks. With this end in view, it is planned to establish a girls' *collège* and secondary domestic science school.

Owing to the increasingly large number of pupils who obtain the *baccalauréat* each year, it is also necessary to envisage the establishment, in the near future, of a teacher training school at post-secondary level.

Another problem now being studied is that of the adaptation of the syllabuses, particularly those for history, geography and the natural sciences, to national conditions and needs.

[*Text prepared by the Ministry of National Education, Lomé, and transmitted by the French National Commission for Unesco in May 1960.*]

STATISTICS

Population (mid-year 1958 estimate): 1,100,000.
Area: 22,000 square miles; 57,000 square kilometres.
Population density: 50 per square mile; 19 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58 there were 73,798 pupils enrolled in all schools (not including courses for adults), representing approximately 7 per cent of the total population. About 96 per cent of these pupils were enrolled in primary schools, divided almost equally between public and private schools. There were 24 per cent girls in the primary school enrolment, and 19 per cent in the secondary schools. The pupil-teacher ratio in public schools was 51 in the primary schools and 19 in the secondary schools. Between 1953 and 1957, there was a 34 per cent increase in total enrolment. (See Table 3.)

Enrolment trends in secondary education, 1950–57. Enrolment in all types of secondary education more than doubled between 1950 and 1957; the increase of pupils in teacher training was five and a half times. The average enrolment was 1.7 per cent of the estimated population 15–19 years old for the period 1955–57, as compared with a ratio of 1.2 for the period of 1950–54. (See Table 1.)

Examination results in secondary education, 1953–57. Total number of certificates granted in 1957/58 was almost three times as many as in 1953/54. There was a steady increase during this period for each category except the *brevet* (secondary schools, lower stage) and the *baccalauréat*, first part, where the highest number of certificates was awarded in 1956/57. (See Table 4.)

Educational finance, 1958. For the fiscal year beginning in January 1958, the educational budget was 461 million C.F.A. francs. Including another 48 million francs from the Investment Fund for Economic and Social Development (FIDES), the total amount of nearly 509 million francs represented an average expenditure of 463 francs per inhabitant. Capital expenditure was about 15 per cent of the total. (See Table 2.)

TRUCIAL OMAN

A modern form of education is a comparatively recent arrival in the Trucial States. There is still no secondary education properly so-called, and the primary-intermediate schools will accept pupils of age groups more usually found in secondary schools. It is hoped that secondary education proper will develop as a generation arises which has completed a full primary-intermediate course of study.

Meanwhile it is worth pointing out the strides which have been made in primary-intermediate education since the first two volumes of the *World Survey of Education* were written. Dubai now has four boys' schools (compared with two) with 1,115 pupils and two girls' schools with 325 pupils. Sharjah boys' school has been nearly doubled in size to accommodate 900 pupils, and there are now 200 girls in the girls' school. The Sheikhdoms of Abu Dhabi, Ajman, Umm al Quwain, and Ras al Khaimah all have modern boys' schools, and a new one is being built in Khor al Fakkan, in Sharjah's eastern territories.

The educational system is that of Kuwait, and many of the teachers in the Trucial States are provided by the Kuwait and Qatar Education Departments, who have also provided financial assistance and school stationery. A further point worth mentioning is that the newest school in Dubai was financed largely by public contributions.

A trade school was opened in Sharjah in 1958. It is financed by the British Government which, like the Kuwait and Qatar Governments, has given considerable financial assistance towards education in the Trucial States. At the trade school 32 boys are taking courses in carpentry, fitting, and other trades. The only other technical training is provided by a British-financed agricultural school in Ras al Khaimah.

There is no teacher training within the Trucial States, but the British Government, in conjunction with the Ruler of Dubai, provide funds for about ten boys to go each year to Bahrain for teacher training.

[*Text prepared by the Agency, Dubai, in February 1960.*]

STATISTICS

Population (mid-year 1958 estimate): 86,000.
Area: 32,278 square miles; 83,600 square kilometres.
Population density: 3 per square mile; 1 per square kilometre.

THE EDUCATIONAL SYSTEM

Tunisia's educational system is governed by Presidential decrees and decrees of the former Beys which have not been annulled, and school laws, supplemented by instructions and circular directives issued by the State Secretary for National Education. The Secretariat controls all matters relating to education.

The public educational authorities are assisted in their work by cultural bodies which organize conferences, debates or symposia on current questions. There are also private associations which give material assistance to deserving pupils who need it. Since Tunisia gained its independence, an awakening of civic spirit has been observed among the inhabitants of some of the inland towns, which are pooling their resources to build a secondary school in their district. They are receiving assistance and encouragement in every possible way from the State Secretariat for National Education, which assumes responsibility for the technical aspect of the project (choice of site and drawing up of plans) and in general for construction work and the provision of equipment.

The structure of the Tunisian school system is seen in the diagram on page 1087.

THE DEVELOPMENT OF SECONDARY EDUCATION

Modern secondary education. Access to modern secondary education was not easy for Tunisian pupils in the days of the French Protectorate. At that time the courses and curricula were identical with those in France, except for the courses called 'Sadikian' or 'Tunisian', which included the study of Arabic language and literature.

Since independence, freedom of access to secondary education has become the rule, but the old curricula have been provisionally retained, with a few changes, pending more thorough-going reforms.

Tunisian diplomas have been introduced—the elementary secondary school certificate (*brevet élémentaire de l'enseignement secondaire*—BEES) and the secondary school leaving certificate (*baccalauréat de l'enseignement secondaire*, in 2 parts), which are awarded to pupils on completion of the first cycle and the complete course of secondary education respectively. The Tunisian *baccalauréat* is recognized as the equivalent of that of the French and admits the holder to French universities as well as to the Tunis Institute of Higher Studies. The Tunisian authorities have decided, however, to abolish the Sadiki secondary school diploma (*diplôme de fin d'études secondaires du collège de Sadiki*); this used to be recognized by the authorities of the Protectorate as the administrative equivalent of the *baccalauréat*, but as the examination was at the same level as the first part of the *baccalauréat*, many pupils who obtained the diploma did not go on with the second part of the latter and were therefore not eligible for admission to institutions of higher education.

On 1 October 1958, a far-reaching structural reform of education came into force in Tunisia. The main changes affecting secondary education are:

The length of the secondary school course has been reduced from 7 years to 6, but without prejudicing the quality of the standard of teaching.

The first year of secondary school, which is common to all types of course, has been made a direction-finding year. At the end of this year the pupils' records are carefully examined by the Vocational Guidance Council, and they are directed to one of the three branches of secondary education—general, commercial, technical.

Training in manual work (wood and metals), hitherto non-existent, has been introduced into secondary school curricula.

Training in the sciences, practical work and modern languages has been greatly improved.

A greater degree of specialization has been introduced in the second cycle.

Lastly, the *brevet élémentaire de l'enseignement secondaire* (BEES) will be abolished when the reforms are applied to the whole of the first cycle. At the end of this cycle, which has been reduced from 4 to 3 years, the only certificate awarded will be a *certificat de scolarité* (school certificate). It will be issued by the director of the school the pupil has attended, and will show the pupil's school record.

Secondary education at the Zeituna Great Mosque. As well as modern secondary education in *lycées* and *collèges*, the Protectorate authorities maintained the traditional courses given at the Zeituna Great Mosque at Tunis and in the schools attached to it. The curriculum did not include either modern science or modern languages; the only instruction given was in the traditional Muslim subjects—theology, incantation of the Koran, and exegesis of texts.

Towards the end of the Protectorate, however, an attempt was made, though only on a small scale, to modernize the curricula of 'Zeitunian' education. In particular, the decree promulgated by the Bey on 11 November 1950 set up a commission to study ways of modernizing the teaching given at the Great Mosque.

Since independence, a more thorough reorganization has taken place under the Decree of 26 April 1956, which stipulated, amongst other reforms, that the Zeituna University and the colleges attached to it (which were formerly part of the Great Mosque) should be under the jurisdiction of the Ministry of National Education.

Under recent reform measures, Zeitunian teaching is to be progressively and rapidly abolished. The first year of the Zeituna course has already been discontinued, as from October 1958, and replaced by the first year of the secondary school course, section A, the curricula for which are

identical with those of the other sections, but instruction in all subjects is given in Arabic (French is the first compulsory foreign language).

Technical secondary education. Until 1943, technical education in Tunisia was rudimentary. There were only two technical secondary schools, the Collège Emile Loubet for boys, established in 1898, and the Collège Paul Cambon for girls, established in 1914.

Vocational training was given in workshops attached to primary schools, particularly Muslim girls' primary schools, where the traditional crafts were taught (carpet-weaving, embroidery). There were three industrial schools for boys.

Between 1943 and 1945, vocational training centres were opened (13 for boys and about 10 for girls). In 1945 an independent Technical Education Department was established, as well as technical *collèges* at Sfax, Susa and Bizerta. Since the coming of independence, the vocational training centres have been reorganized, and more have been opened (there were 50 in 1958).

Legal basis

The recent changes in school organization were carried out in execution of Law No. 58–118 of 4 November 1958. Under this law, both general and technical education were reformed and a new type of lower secondary education, called 'intermediate education' (*enseignement moyen*), was established. Intermediate education is gradually to replace vocational training as given at present in vocational training centres, which will accordingly become intermediate schools (*collèges moyens*).

Administration

The Chief of the Secondary Education Department of the State Secretariat for National Education is responsible for the organization of general secondary education. New curricula are drawn up by technical commissions, appointed by the State Secretary, which work in close collaboration with the Secondary Education Department. Similar arrangements have been made for the preparation of new school textbooks to replace those still in provisional use.

A commission has been appointed to study curricula for the new intermediate courses. The syllabus for each subject, in each of the three years, is prepared by a sub-committee of teachers. The State Secretariat publishes school textbooks prepared by groups of teachers; books for Arabic, French, drawing and handicrafts were published in 1958/59.

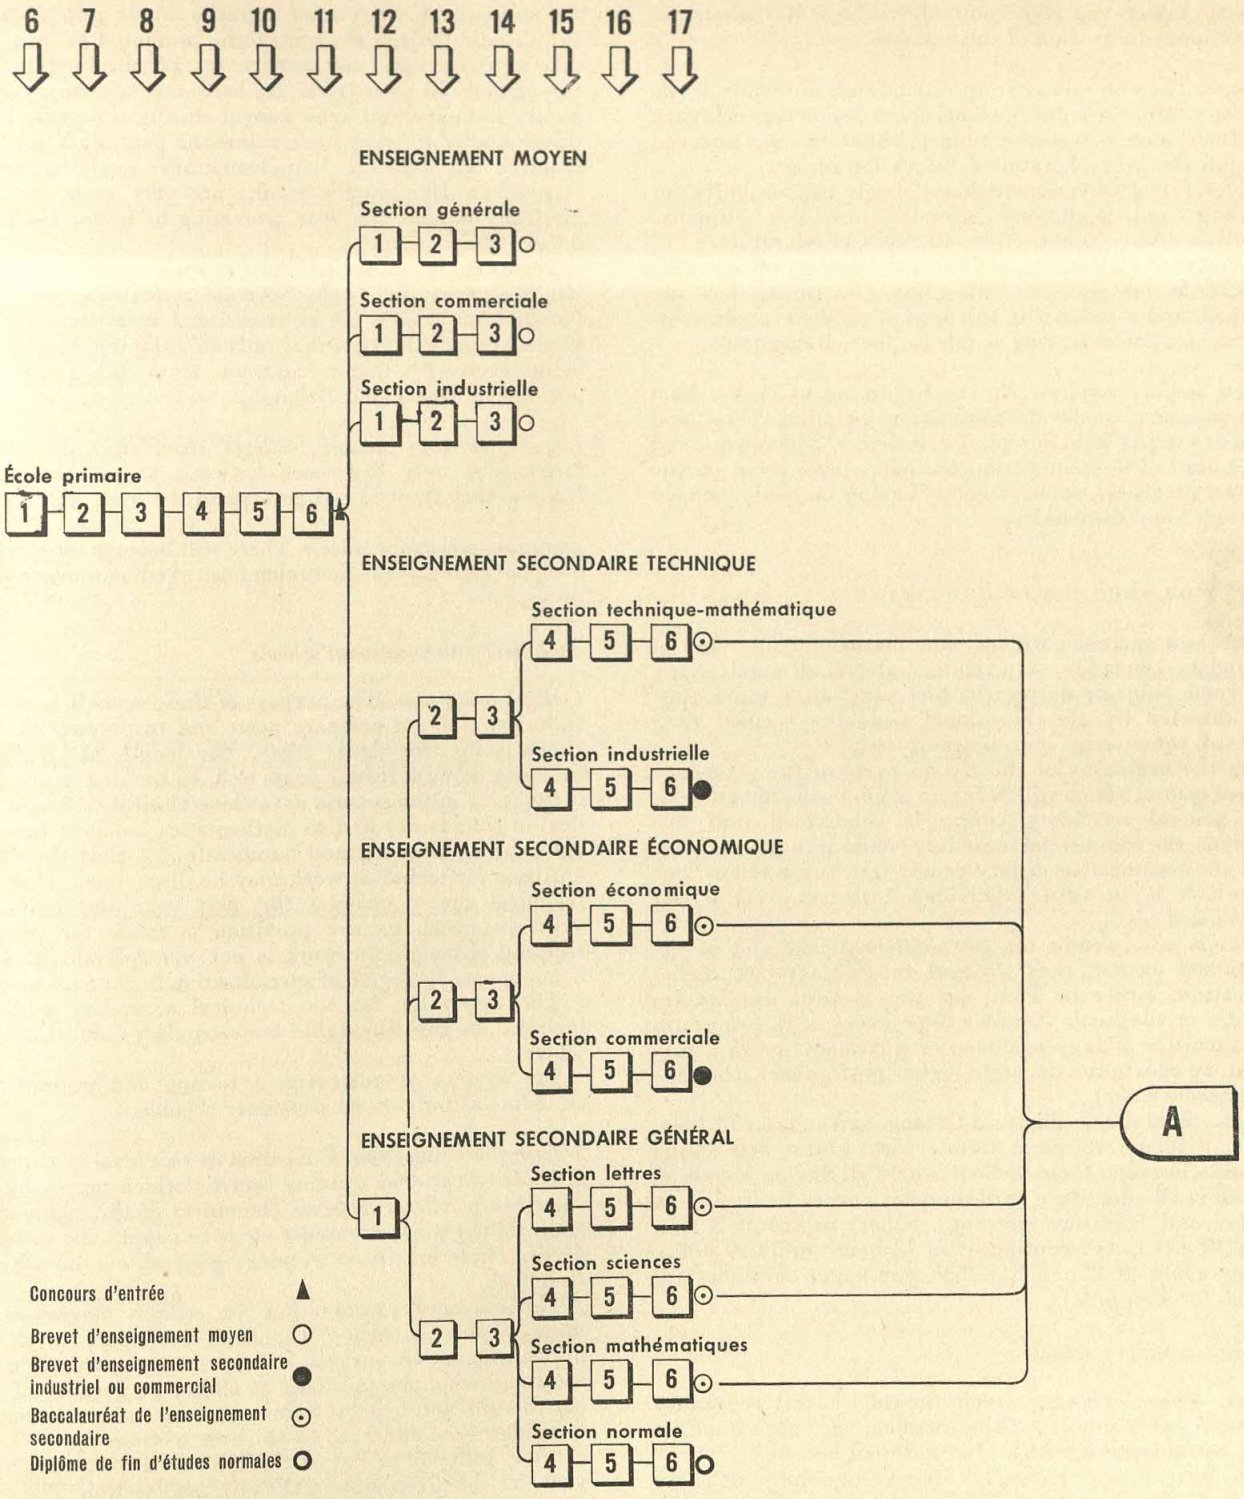
Control. The heads of general secondary schools are directly responsible to the Chief of the Secondary Education Department, who convenes a meeting not less than once a year (at the beginning of the school year) and who also communicates to them his directives and instructions by circular.

The directors of technical secondary schools (*collèges techniques*) are directly responsible to the Chief of the Technical Education Department. Vocational training centres are, as a rule, under the jurisdiction of the technical inspectors, but some are under other government Secretariats. Agricultural schools, for example, are attached to the State Secretariat for Agriculture, and the Training Centre for Footwear Production comes under the State Secretariat for Social Affairs.

Regional governors exercise general supervision over schools in their own region, and, through the State Secretariat for the Interior, report to the State Secretariat for National Education on the functioning of the school system, or transmit the people's wishes on some point. Private schools receive assistance and support from the State Secretariat for National Education.

Inspection. Until Tunisian inspectors can be trained, certain provisional arrangements have been made. General and technical secondary schools (*lycées* and *collèges*) are visited every year by inspectors-general of the French Ministry of National Education, and inspection of intermediate and vocational schools is being carried out by officers appointed to inspect general education, agricultural education, technical education and Tunisian arts. It is proposed to introduce a competitive recruitment examination for inspectors of technical education and to hold training courses in France for future candidates.

Private bodies have no real rights of supervision over the educational establishments they administer. They may,



GLOSSARY

école primaire: primary school.
enseignement moyen (intermediate education): terminal secondary education with practical or vocational bias, and offering three types of course—general, commercial and industrial technical.
enseignement secondaire général: general secondary education with differentiation in the upper cycle into four courses emphasizing respectively literary studies (*lettres*), the sciences, mathematics and teacher training (*section normale*).
enseignement secondaire économique: vocational secondary education in commerce with differentiation in the upper cycle into course leading to higher professional education (*section économique*) and course preparing for employment at intermediary level in commerce (*section commerciale*).
enseignement secondaire technique: vocational secondary education with differentiation in upper cycle into course preparing for higher technical education (*section technique-mathématique*) and employment at intermediary level in technical or industrial occupation (*section industrielle*).

A. Higher education.

EXAMINATIONS

concours d'entrée: competitive entrance examination.
baccalauréat de l'enseignement secondaire: secondary leaving and university entrance examination.
brevet d'enseignement moyen: intermediate leaving examination.
brevet d'enseignement secondaire industriel ou commercial: certificate of secondary technical or commercial studies.
diplôme de fin d'études normales: teacher training diploma.

however, make suggestions and inform the State Secretariat for National Education of their wishes.

Finance. The only source from which funds are drawn is the Treasury. A few secondary schools have juridical personality and these have a separate budget; the others are financed through the general National Education budget.

The Central Government has the sole responsibility for building and equipping schools (providing supplies, furniture and equipment) for all types of education.

Teachers' salaries are carried on the budget of the State Secretariat for National Education. No tuition fees are charged, and assistance in the form of resident scholarships is provided for deserving pupils in poor circumstances.

School welfare services. At the beginning of each school year a general medical examination including X-ray and sight-testing is held for pupils, teachers, supervisors and office staff. The examination normally takes place on the school premises, some schools having a well-equipped infirmary and dispensary.

TYPES OF SECONDARY EDUCATION

There is a general entrance examination for all types of secondary education. As explained above, all pupils study the same subjects during the first year, after which they are directed by the Vocational Guidance Council to a general, commercial or technical course.

At the beginning of the second cycle of the secondary school course, which will in future begin in the fourth year, the general secondary course is subdivided into five sections, the commercial secondary course into two sections, and the technical secondary course into two sections, one of which is in turn subdivided into sub-sections for specialized work.

Pupils who obtain the *baccalauréat* at the end of the secondary course may proceed to any type of higher education, either in Tunis (at the Institut des Hautes Etudes or the Ecole Normale Supérieure) or in France (in the faculties of law, medicine or pharmacy, or in a preparatory course for the state higher professional schools—the *grandes écoles*).

The school year begins on 1 October and ends on 30 June. It is divided into three terms, with winter and spring holidays between them. School is held all day on Mondays, Tuesdays, Wednesdays and Thursdays every week, and on Friday and Saturday mornings. School begins at 8 a.m. (or 8.30 a.m.), and continues till 12 noon (or 12.30 p.m.), begins again at 2 p.m. (or 2.30 p.m.) and continues till 4 p.m. (or 4.30 p.m.).

General secondary schools

Lycées. These schools, which provide a full secondary course, prepare pupils for the *baccalauréat*, which qualifies them to undertake a higher educational course.

The first table on page 1089 shows the number of hours per week allotted to the various subjects in the Tunisian secondary school curriculum.

In the first year the Vocational Guidance Council and in the subsequent years class councils assess pupils' results and decide whether they are to be promoted or not. They take into account the average marks obtained in tests throughout the year (tests are held once a term), and the pupil's industry and achievement during the year. Pupils whose marks are very little below the pass mark are often required to take a 'supplementary examination' in September. If a pupil's results are very poor, he automatically repeats the year, providing he is not too old to do so.

Teachers are trained in Tunis at the Institut des Hautes Etudes, or at the Ecole Normale Supérieure, or in the faculties in France. As a provisional measure, until the Ecole Normale Supérieure is fully functioning, teachers are being recruited under contract from other countries (especially France and Belgium).

Lower secondary schools (collèges secondaires du premier cycle). The only difference between these schools and *lycées* is that they do not go beyond the first cycle.

Zeitunian secondary schools. These will become *collèges* (first cycle) or *lycées*, as the Zeitunian form of education gradually disappears.

Technical and vocational schools

Collèges techniques. The purpose of these schools is to train technical staff for ordinary posts and to prepare the best students for the higher posts. The length of the course has been reduced from 7 years to 6. In the first year, which is the same in the general as in the technical course, a good deal of time is devoted to mathematics, sciences based on observation, drawing and handicrafts, so that the pupil's aptitude for technical work may be discovered. The lower technical course includes this first year and two other years in which greater provision is made for practical training although the work is not yet specialized. There is an increasing degree of specialization in the second cycle.

The time-table for the technical secondary course is included in the time-table for secondary education as a whole.

The system of achievement testing and promotion is the same as for general secondary schools.

Intermediate education. Education at this level is at present given in vocational training centres, which are to be converted into *collèges moyens.* The object of the courses is to train skilled workers rapidly so as to supply the country's needs. There are three sections—general, commercial and technical.

The entrance examination for *collèges moyens* is the same as for the other schools at secondary level. The pupils who are encouraged to take the intermediate course are those who, through lack of ability or because of their age, would not benefit from a full secondary education. Candidates are admitted to all three sections up to the age of 16. Permission to exceed this limit by a maximum of one year may be given only in the technical section. The tables below show the number of hours per week allotted to the various subjects of the curriculum in lower secondary schools.

1. Where there is a difference between courses for boys and courses for girls the figures for the latter are given in parentheses.
2. An 'optional study' is the study of a topic related to the general organization of the country or some department of economic and social life. The topic studied should be of definite practical interest to the pupils and enable them to learn more about their country and the world. A list of possible 'optional studies' will be issued by the State Secretariat for National Education. Each school will select its 'optional study' or 'studies' from this list.

Vocational training centres now offer training in the following special subjects: for boys—fitting, automobile mechanics, machine-tool making, lathe work, foundry work, locksmithing, electricity, sheet iron work, plumbing, cabinet making, damascening, leather-work, agriculture, rural crafts, masonry, reinforced concrete work, carving, printing, book-binding; for girls—cutting, sewing, embroidery, chebka-weaving, carpet-weaving, lace-making, lingerie-making, hairdressing.

It is proposed that these subjects should be taught in some of the intermediate schools, depending on the facilities available in the various regions and the needs of the country as a whole.

Teacher training schools

Teachers for primary schools are trained in teacher training schools for men and women. Training schools are residential, and board is provided free of charge. The course is of 4 years' duration—3 years' general education and 1 year of vocational training.

Arabic is exclusively used for the first 2 years of the primary course, and Arabic and French for the following 4 years. Teacher training schools in Tunisia are therefore divided into Section A, in which students are trained in both languages, and Section B, in which syllabuses are entirely in Arabic.

Candidates must have completed 3 years' secondary schooling. They are recruited either by competitive examination or by consideration of their record. In both cases, candidates are required to obtain 50 per cent of the possible total. On entering the teacher training school, pupil-teachers undertake to serve in the Tunisian public education department for 10 years. (If they do not keep their agreement, they have to pay the cost of their training.) Before admission, candidates are also required to produce a medical certificate stating that they are physically suited for teaching.

Both theoretical and practical subjects are taught, including Arabic, French,[1] philosophy, psychology, pedagogy, history, geography, religious instruction, mathematics, physics, chemistry, natural science, music, drawing, handwork (woodwork, book-binding, electricity and agriculture for men; and sewing, drawing and housewifery for women), physical education and sports.

In general, curricula are drawn up in accordance with secondary school curricula in *lycées* and *collèges*, the first year of the teacher training course corresponding to the third year of the secondary school course, the second year of the teacher training course to the fourth year of the secondary school course, and the third year of the teacher training course to the fifth year of the secondary school course.

The fourth year is entirely devoted to theoretical and practical vocational training. Pupil-teachers receive theoretical training in general psychology, child psychology, general pedagogy, methods of teaching each subject, sociology and ethics, and practical training in the form of practice teaching in various classes, so that in the 9 months of the school year they gain a general idea of the 6 years of the primary school course. Theoretical training periods are held alternately with periods of practical work.

At the end of the third year's work, successful candidates obtain the *diplôme d'études générales*, and at the end of the fourth year, the *certificat de fin d'études normales*.

The staff in these schools are secondary school teachers who have obtained a university degree (*licence*) or have passed the competitive examination for the *agrégation*. They receive no special training.

Out-of-class activities

Pupils do not take any direct part in the internal organization of *lycées* and *collèges*. The schools arrange for talks to be given and for cinema and theatrical performances to be held, especially at the end of the school term.

Most secondary schools have a cultural club which, in addition to other activities, sometimes produces a school newspaper.

The School Youth Association, which is open to all pupils and receives the assistance of the teaching staff, arranges exhibitions (for example, of gouache painting), excursions, etc.

Lastly, each school has its own sports teams (football and handball), and sports competitions between the different schools, at which championships are held and cups awarded are organized annually by the Youth and Sports Council.

TRENDS AND PROBLEMS

The major concern of the State Secretariat for National Education and in particular the Secondary Education Department is to organize the development of secondary education so that it will better fulfil the needs of a country which has recently gained its independence, especially by promoting the training of skilled technicians and qualified workers.

[*Text prepared by the State Secretariat for National Education, Tunis, in May 1959.*]

STATISTICS

Population (mid-year 1958 estimate): 3,852,000.
Area: 48,332 square miles; 125,180 square kilometres.
Population density: 80 per square mile; 31 per square kilometre.

Summary of school statistics, 1953–57. Total enrolment from primary to university level in 1957/58 was about 350,000 pupils, representing 9 per cent of the estimated population. Of the school-going population, over 86 per cent were enrolled in primary schools, about 9 per cent in general secondary schools, under 4 per cent in vocational secondary schools and the remainder, under 1 per cent, in teacher training courses and at university colleges. Girls made up 33 per cent of enrolment in primary schools in 1957/58 against 29 per cent in 1953/54, and in general secondary schools 25 per cent compared with 19 per cent at the beginning of the period under review. However, in secondary teacher training courses the proportion of women enrolled was less than 18 per cent and in the higher teacher training schools only 5 out of 70 students were women. The number of women at university level increased slowly over this period and in 1957/58 women students were nearly 20 per cent of total university enrolment. Data on number of teachers at all levels of education are incomplete. In 1957/59 the average pupil-teacher ratio in public primary schools was about 43.

Compared with 1953/54 enrolment increased by 43 per cent in primary schools, by 2 per cent in general secondary schools and by 61 per cent in teacher training schools. From the figures available, it appears that enrolment declined considerably in vocational schools and slightly at university colleges between 1953/54 and 1957/58. (See Table 2.)

Enrolment trends in secondary education, 1930–57. From the incomplete data available on enrolment in public general secondary schools it appears that the number of pupils doubled in the 20 years from 1930–1949. Despite temporary setbacks, general secondary education has developed very rapidly in recent years and in 1957 enrolment in all general secondary schools was nearly 50 per cent higher than in 1950, although the proportion of girls appears to have declined compared with earlier periods.

The enrolment trend in vocational education has fluctuated, probably owing to changes in the classification of schools since the beginning of the period under review. From 1950 to 1954 enrolment increased steadily by some 36 per cent but this expansion was not maintained in the following 3-year period 1955–57. Students in public teacher training schools, on the other hand, rose by over 93 per cent between 1950 and 1957 but the proportion of women declined sharply from 43 per cent in 1955 to 18 per cent of enrolment in 1957.

The ratio of average total enrolment in public secondary education to the estimated population 15–19 years old moved only from 3 to 5 over the 20 year period 1930 to 1949. Since 1950 data are more complete and the ratio has risen from 12 over the period 1950–54 to 13 in the years 1955–57. (See Table 3.)

Examination results in secondary education, 1953–57. Excluding diplomas from Zeitunian colleges, the number of certificates awarded in all sectors of secondary education increased by nearly 55 per cent over the 5 years 1953–57. In particular, the number of successful candidates for the first part of the *baccalauréat* nearly doubled and for the second part increased by 69 per cent. The number of teaching certificates awarded appears to have declined in recent years but data are incomplete. On the other hand, technical and apprenticeship diplomas granted have increased markedly since 1953/54. (See Table 4.)

Educational finance, 1957/58. Total expenditure on education in 1957/58 (fiscal year beginning April) was 8,980,900 Tunisian dinars, representing approximately 2.4 dinars per inhabitant. Of this sum, about 13 per cent was for capital expenditure. The distribution of the remainder by level and type of education is given in Table 1B.

TURKEY

THE EDUCATIONAL SYSTEM

Education comes entirely under the jurisdiction of the Ministry of Education. In deciding policy matters, the Minister is assisted by the Higher Council of Education, a body comprising senior officials of the Ministry of Education and other Ministries, and representatives of the universities, the inspectorate and the state school system. This council meets every three years. A Council of Instruction and Education functions permanently as an advisory body concerned principally with technical problems. A Council of Inspection also forms part of the Ministry. Its members, termed inspectors-general, visit and supervise schools at the secondary level throughout the country.

The country is divided for administrative purposes into 63 *vilayets* or provinces. Each provincial authority has an educational section.

There are in Turkey private schools of various origins—Turkish, foreign, minority groups. Turkish private schools comply with the regulations and curricula of the state schools. Foreign and minority schools have their regulations and curricula approved by the Ministry of Education. All private schools are subject to the control of the Ministry and may be inspected when necessary.

Primary education is compulsory for all children, of either sex, from 6 to 14 years of age. Only children who have completed the five years of primary schooling before reaching the age of 14 are exempt from this obligation. Compulsory schooling does not extend to secondary education. On the other hand, pupils who reach the age of 14 before completing their primary schooling continue to attend school until the end of the school year during which they reach 16 years.

The structure of the Turkish educational system is shown in the diagram on page 1095.

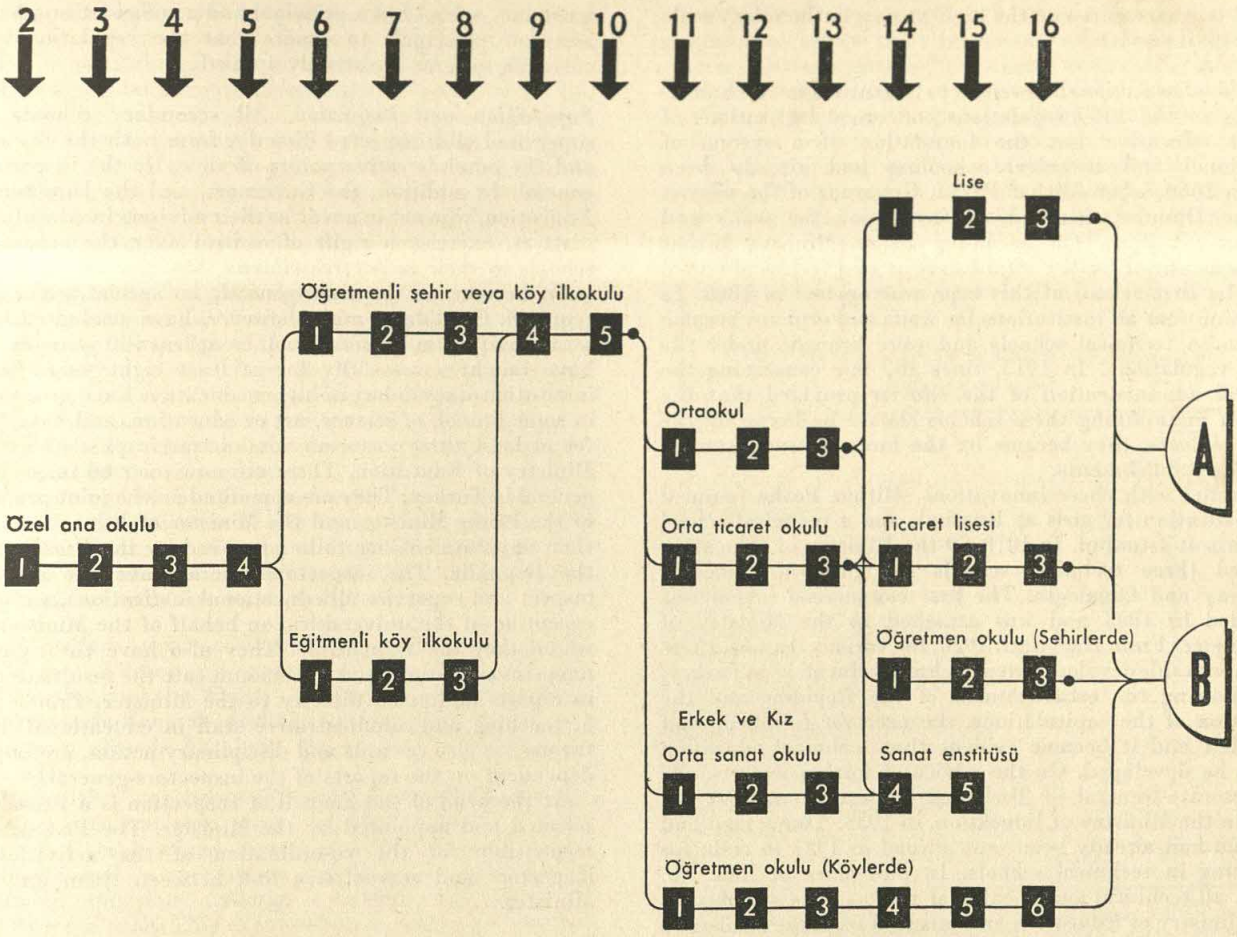
THE DEVELOPMENT OF SECONDARY EDUCATION

General education and teacher training. The principles set forth in the 1869 'Regulations on Education' divided Turkish schools, for the first time, into three levels—elementary schools, *rüştiye* and *idadi*, and higher schools (*grandes écoles*) (higher educational level).

The elementary schools covered only 3 years. The *rüştiye*, serving as an intermediate stage between the elementary schools and the *idadi*, were regarded as secondary schools. The *idadi*—the term means 'preparatory'—comprised sometimes 5 and sometimes 7 grades (including those of the *rüştiye*). The chief towns of *sanjaks* (districts) had 5-grade schools; the chief towns of *vilayets* 7-grade schools.

In 1912 six *sultani* (imperial schools) were founded, with the object of preparing candidates for the higher schools. They offered a 6-year course following on from the primary school. In 1913–14 the number of grades in secondary schools was increased and secondary education was divided into two cycles, the first covering 4 years and the second 3 years. Following yet another reform, the *sultani* course was divided into two cycles, constituted by 8 grades and 3 grades respectively. Meanwhile the *sultani* for girls, which originally had 10 grades, were brought into line with the *sultani* for boys, with 11 grades.

Throughout this period the principles of Ottoman culture formed the foundation of education at all levels.



At the time when the Republic was proclaimed, the only establishments providing secondary education were the *sultani*, financed by the State, and the *idadi* and primary teacher training schools, financed by the *vilayets*.

In 1923, the *sultani* were completely re-organized from both the administrative and the educational points of view. The teacher training schools and the *idadi*, which were stagnating in the hands of the local authorities, were brought under the control of the State, and on 1 September 1923, attached to the Ministry of Education. The first scientific commission, which met in 1923, changed the *sultani* into *liseler* (*lycées*).

Under the law unifying education, which came into force in March 1924, all schools and scientific institutions were transferred to the jurisdiction of the Ministry of Education. The second scientific commission, which met in 1924, decided that the *liseler* should have 11 grades (primary and secondary) and that the schools which had only the first-cycle grades should be called intermediate schools. In addition, it brought the standard of girls' *liseler* into line with that of boys' schools, introduced a fifth grade in the teacher training schools, which previously had only four, and included social science in the curriculum of establishments at this level. The 1925 law made secondary school teaching a real profession. Teachers were divided into three categories—for higher, secondary and primary education respectively.

The third scientific commission, which met in 1926, considered the main problems relating to public education in Turkey and took the following decisions: to use to the best advantage the appropriations for public education and to organize the schools in such a way that they could be attended by all children wishing to receive an education; gradually to increase the number of upper secondary schools in certain localities; to concentrate teacher training schools in the big towns and enlarge their staff; to concentrate vocational schools in the big towns and take steps for their development; to make day schools co-educational; to provide professional training for probationer teachers; to draw up laws instituting regular promotion for teachers; to set up, within the Ministry of Education, a higher council to deal with educational and teaching problems.

These decisions led to the promulgation of the law of 22 March 1926 concerning the organization of the Ministry

GLOSSARY

eğitmenli köy ilkokulu: incomplete rural primary school staffed by 'instructors' (partly-trained teachers).
erkek ve kiz; orta sanat okulu: vocational training school offering various technical or trade courses for boys and girls at lower secondary level.
lise: general secondary school. Diagram shows upper cycle only; complete course (6 years) includes lower cycle equivalent to intermediate school (see *ortaokul*).
öğretmenli şehir veya köy ilkokulu: urban or rural primary school staffed by trained teachers.
öğretmen okulu (Köylerde): rural teacher training school.
öğretmen okulu (Şehirlerde): urban teacher training school.
ortaokul (intermediate school): lower general secondary school organized either as the lower cycle of a *lise* or as a separate institution.
orta ticaret okulu: lower vocational secondary school of commerce.
özel ana okulu: pre-primary school.
sanat enstitüsü: upper vocational secondary school with various technical courses.
ticaret lisesi: upper vocational secondary school of commerce.

HIGHER EDUCATION

A. University.
B. Institutions other than university.

of Education. Article 7 of the law distinguished four types of institution at the secondary level: upper secondary schools, intermediate schools, primary teacher training schools and rural primary teacher training schools. Another law promulgated in 1926 (Law No. 822) provided that secondary education would be free of charge in the state schools. This law came into force in the school year 1926–27. In the same year a third law prescribed the procedure to be followed with regard to the admission of scholarship-holders to state secondary schools. During the school year 1927–28, religious instruction was made an optional subject. Lastly, by a law promulgated in 1930, the Government of the Republic, anxious to secure the well-being of the teaching body, made it possible for secondary

school teachers to rise to the highest step in the salary scale of the civil service.

Vocational education. References to 'scientific' or 'technical' schools in the 1869 regulations concerned institutions of higher education but the foundation of a system of vocational and technical schooling had already been laid in 1860, when Mithat Pasha, Governor of the *vilayets* of the Danube, founded an institution for waifs and orphans at Nish. On becoming Prime Minister Mithat Pasha arranged for the establishment of a technical school and the first school of this type was opened in 1868. In the same year all institutions for waifs and orphans became known as technical schools and were brought under the same regulations. In 1913, since the law concerning the general administration of the *vilayets* provided that the cost of maintaining these schools should be borne by the local budgets, they became by the force of circumstances public establishments.

Parallel with these innovations, Mithat Pasha founded an institution for girls at Ruschuk and a technical school for girls at Istanbul. In 1878–79 the Ministry of Education opened three technical schools for girls—at Uskudar, Aksaray and Cagaloglu. The first commercial school was founded in 1883 and was attached to the Ministry of Commerce. From then until 1920, for various reasons, there was no notable development of technical education in Turkey.

Following the establishment of the Republic and the abolition of the capitulations, the need for technical staff was felt and it became evident that technical education must be developed. On the advice of foreign experts, the Directorate-General of Technical Education was set up, within the Ministry of Education, in 1933. Young men and women had already been sent abroad in 1927 to train for teaching in technical schools. In pursuance of Law No. 2765, all technical and vocational schools were attached to the Ministry of Education and financed from the Ministry's budget. Law No. 3007, promulgated in 1936, set forth the qualifications required of teachers in technical schools and the way in which the general salary scale for civil servants was to be applied to them. Technical institutes for boys were set up from 1923, and institutes for girls from 1928–29. There was a marked expansion of vocational schools of commerce.

Technical and vocational education occupy an important place in Turkey and the Government of the Republic has not hesitated to be lavish in this sector.

Administration

All secondary schools, whether public or private, come under the authority of the Ministry of Education through the Under-Secretaries of State, the Directors-General and the Directors of the Ministry. Secondary institutions are now administered by the Under-Secretary of State for Technical Education, the Director-General of Secondary Education proper, the Director-General of Teacher Training Schools, the Director-General of Fine Arts and the Director of Private Schools.

In the *vilayets* the Ministry exercises its authority either through the Governor, who represents the Government, or through the provincial Director of Education. Each secondary school has a principal and a sufficient number of assistant principals to ensure that the regulations and curricula in force are strictly applied.

Supervision and inspection. All secondary schools are supervised and inspected directly, from both the teaching and the administrative points of view, by the inspectors-general. In addition, the Governors, and the Directors of Education, who act in a way as their advisers in educational matters, exercise a right of control over the secondary schools in their respective *vilayets.*

To become an inspector-general, no special training is required. Candidates must, however, have graduated from a university or a higher school, be at least 30 years of age, have taught successfully for at least eight years in an institution of secondary or higher education, have specialized in some branch of science, art or education, and have held for at least three years an administrative post under the Ministry of Education. There are now over 60 inspectors-general in Turkey. They are appointed on the joint proposal of the Prime Minister and the Minister of Education, and their appointment has to be approved by the President of the Republic. The inspectors-general have the right to inspect and supervise all educational institutions, with the exception of the universities, on behalf of the Minister, to whom they are responsible. They also have the right to make investigations and to communicate the results thereof in reports addressed directly to the Minister. Promotions of teaching and administrative staff in educational institutions, as also rewards and disciplinary action, are largely dependent on the reports of the inspectors-general.

At the head of the Council of Inspection is a President, selected and appointed by the Minister. The President is responsible for the co-ordination of the activities of inspectors and serves as a link between them and the Minister.

Finance. Secondary education is not compulsory in Turkey. However, any citizen who has completed the primary course may go on to a secondary school if he expresses the wish to do so. Secondary education is free in all state schools. In private schools the fees are determined by the local government authorities. Boarders in state schools have to pay for their board, but this charge is minimal.

All costs relating to public secondary schools are borne by the State. Private schools are financed entirely by the persons, associations or communities that founded them. In some cases, however, they receive assistance from the State.

Teachers' salaries and allowances, as well as their travel expenses and medical expenses, are paid by the State. So are the costs of construction and upkeep of buildings used for secondary education. School furniture and equipment are supplied by the State.

At primary teacher training schools, which are usually boarding establishments, students are housed and boarded free of charge. In 1958 the budget of the Ministry of Education reached a total of £T551,399,644. Of this amount £T83,452,643 were allocated to general secondary education, £T80,929,492 to technical education, £T7,478,430 to the Directorate-General of Fine Arts, and £T20,621,007 to the Directorate-General of Teacher Training Schools.

Buildings and equipment. In Turkey, the problem of school buildings is as great as the problem of education itself. With the constant growth in the number of pupils, the need for school buildings is increasingly felt and is becoming, in a way, the main concern of the appropriate authorities. The buildings at present in use, some of which belong to the State, others to local governments or to charitable institutions, were constructed at very different periods. In Istanbul, for instance, there is one dating from 1471; although almost 500 years old, this is one of the biggest schools in the country, owing to the care with which it is kept up and the fact that new wings and other supplementary sections are frequently added. New school buildings are all designed to meet modern requirements. Besides erecting new buildings, the Ministry is also gradually purchasing those that belong to other administrations. In this connexion, it is only fair to mention the contribution made by the local population which attaches great importance to educational questions.

The number of buildings set aside for technical and vocational education increases every year, despite the particularly high cost of such buildings. The State owns all buildings of this type, as well as all the teacher training schools and schools for *imams* and preachers.

School welfare services. Hygienic conditions in school buildings in Turkey are supervised by both the Ministry of Education and the Ministry of Health. For this purpose, a Directorate-General dealing solely with health and hygiene in schools has been set up in the Ministry of Education.

The health of teachers and pupils is supervised, and the necessary medical care given, by the doctor or doctors attached to each school. Every pupil must have a health certificate and a vaccination certificate at the time of enrolment and must undergo a medical examination at least twice a year. This examination is carried out by the school doctor, who records his findings on a health card and takes any measures that are necessary. He provides medical care in emergencies and, in case of need, has the patient admitted to hospital immediately. The cost of hospital treatment for pupils and teachers is borne by the State. In every boarding school there is a sick-room and in every day-school a medicine chest.

Pupils and teachers suffering from pulmonary tuberculosis are treated at the Validebagi preventorium or sanatorium, at Istanbul. In the case of needy pupils, no charge is made by these establishments, and even the children of well-to-do families pay very little.

Parents' associations and child welfare societies take a keen interest in health activities. The Red Crescent, in its turn, contributes to the provision of free meals for needy children. The holiday camps opened by the Ministry of Education in the summer give teachers and pupils new health and strength for the coming school year.

TYPES OF SECONDARY EDUCATION

General secondary schools

Intermediate schools. These schools comprise three grades following on from the primary school; at the end of the 3-year course, those pupils who pass the school leaving examination obtain the intermediate school certificate.

Every intermediate school comes under the authority of the Director-General of Secondary Education and is run by a principal, with the help of assistant principals and staff, whose numbers vary according to the size of the school and the number of pupils attending it. If the intermediate school is part of an upper secondary school, it is of course controlled by the principal of the latter. Most intermediate schools are co-educational, separate schools for girls and boys being found only in the large towns. The nature of the courses can be seen from the following table.

TIME-TABLE FOR INTERMEDIATE SCHOOLS
(in hours per week)

Subject	Years		
	1	2	3
Turkish language[1]	6	4	4
History	2	2	2
Geography	2	2	1
Civics	1	1	1
Mathematics	5	4	4
Physics	–	3	3
Chemistry	–	–	2
Natural sciences	3	3	2
Elements of commercial practice	1	1	1
Agricultural work, gardening	1	1	1
Handwork (boys) / Domestic work (girls)	2	2	2
Foreign language	3	3	3
Physical culture	1	1	1
Drawing	1	1	1
Music	1	1	1
Free work[2]	3	3	3
Total	32	32	32

1. In the first year, one hour of the Turkish language periods must be devoted to penmanship. In the second and third years, penmanship is supervised by the language and drawing teachers and taught during the periods set aside for free work.
2. The three hours of free work are devoted to team work, which may be carried out in the classroom, the laboratory, the library, the garden or the workshop, as required.

In the first and second years, marks are given by every teacher twice a year (at the end of each half year). Pupils who absent themselves 30 days in the year without an excuse have automatically to stay in their class another year. For those who have a valid excuse, there is a margin of 60 days. Pupils whose work is unsatisfactory during the school year may sit in September for an examination which gives them a second chance. If they pass this examination, covering all the prescribed subjects, they can move up to the next grade. If a pupil fails in one subject only, he is promoted on condition of passing the tests in that subject at the half-yearly examination in the new grade. If he fails then, he has to do another year in the previous grade. The same applies to the examination for the intermediate school leaving certificate, to pass which candidates must obtain an average of 5 out of 10 in all subjects.

Pupils holding this certificate may continue their studies at an upper secondary school, a teacher training school with a 3-year course, a technical institute (for boys or girls)

or a commercial secondary school; they may enter the National Conservatory at Ankara or the Academy of Fine Arts; or they may take up a career in a private or public establishment. In Turkey the intermediate school leaving certificate is the minimum requirement for entry to the civil service.

Teachers for intermediate schools are recruited on various bases. Candidates must either have completed a course at a university or a higher school or have passed the examination for assistant teachers. Graduates from a university or the Higher Teacher Training School teach the subjects in which they have specialized; those from teacher training schools (secondary level) teach either on the science or the arts side; foreign languages, music, drawing, handwork and physical culture are generally taught by specialist teachers who have graduated from teacher training schools or from the National Conservatory or the Academy of Fine Arts.

Only candidates holding the secondary school leaving certificate or the primary teacher training school certificate may sit for the examination for assistant teachers. Candidates who pass this examination enjoy throughout their career the same rights as teachers who have graduated from a university or a higher school.

However they may be recruited, all teachers begin their career by a probationary period, varying from one to three years according to their ability. Once they become established, they are entitled to promotion every three years. However, teachers who have graduated from a university or from the Higher Teacher Training School are entitled to a promotion after two years, whereas graduates from the teacher training schools (secondary) are only entitled to a promotion after four years.

Probationer teachers begin at grade 12 of the scale of salaries for civil servants, which comprises 14 grades; by the end of their career they may well have reached the highest grade.

Multilateral intermediate schools. There are now two of these. They are designed to prepare pupils on the one hand for upper secondary schools, technical institutes or commercial secondary schools, and on the other for employment, but pupils acquire in these schools much more practical knowledge than they would in an ordinary intermediate school. If the results are satisfactory, the curricula and study plans used in these multilateral schools will be applied in all intermediate schools. The multilateral schools are governed by the same regulations as other intermediate schools.

Upper secondary schools (*liseler*). The *lise*, which comprises three grades, follows on from the intermediate school. Like the latter, the upper secondary school comes under the Directorate-General of Secondary Education and is run by a principal aided by assistant principals, all of whom are appointed by the Ministry. Boarding schools have, in addition to the normal staff, assistant teachers in charge of preparation time. At present Turkey has 114 state *liseler*. Most of these are co-educational. However, for purposes of decentralization, separate establishments for girls and boys have been set up in some of the big towns. The regulations in force are exactly the same as for intermediate schools.

Pupils who pass the examination for the secondary school leaving certificate may continue their studies at a university faculty or a higher school, and are entitled to enter the army as reserve officers. A few faculties—for instance, those of the technical universities and the architecture section of the Academy of Fine Arts—recruit their students on the basis of competitive examinations; others, such as the Faculty of Medicine and the faculty which trains agricultural experts, are obliged to make a selection amongst candidates owing to the shortage of places in the laboratories.

In the second year of upper secondary schooling, pupils choose between the arts section and the science section, according to their bent and their aptitudes. The subjects prescribed for upper secondary schools are given in the following table.

TIME-TABLE FOR UPPER SECONDARY SCHOOLS
(in hours per week)

Subject	Year				
	1	2		3	
		Science	Arts[1]	Science	Arts[1]
Turkish language and literature	5	4	5	3	6
Psychology	–	2	2	–	–
Philosophy, logic and sociology	–	–	–	3	6
History	2	2	2	2	3
History of art	–	–	2	–	1
Geography	2	2	2	1	2
Mathematics	5	6	4	8	3
Natural sciences	3	2	2	1	–
Physics	3	3	2	4	2
Chemistry	3	3	2	3	1
Foreign language[2]	5	4	5	4	5
Physical culture	1	1	1	1	1
Military training	1	1	1	1	1
Optional subjects[3]	2	2	2	1	1
Total	32	32	32	32	32

1. In upper secondary schools in Turkey, a division takes place in the second year, so that the second and third years have two sections, one for arts and the other for science. When a pupil has opted for one or the other, he is obliged to continue and complete his secondary studies in the section of his choice.
2. On entering intermediate school, pupils choose one of the following three foreign languages: English, French or German. This choice once made cannot be changed before the completion of secondary studies.
3. The optional subjects are as follows: second foreign language (English, French or German), drawing and handwork, music or, in two or three *liseler*, Latin. Once the optional subject has been chosen, it becomes assimilated to a compulsory subject.

Teachers for upper secondary schools are generally recruited from among university graduates and, preferably, graduates from the Higher Teacher Training School. If need be, intermediate school teachers may also teach in an upper secondary school, but only as deputies. For appointment and promotion purposes, teachers in upper secondary schools are subject to the same regulations as those serving in intermediate schools.

Collèges. Collèges are secondary establishments recently opened by the State—there are six of them at the present time. They comprise seven grades, of which the lowest is

preparatory. All children holding the primary school leaving certificate are entitled to sit for the competitive entrance examination, which consists of a series of tests. The teaching of a foreign language (English) occupies an important place in the curriculum of *collèges* and, in all the grades, science subjects are taught in that language. The other subjects are taught in Turkish, in accordance with the curriculum in force in intermediate schools.

TIME-TABLE FOR *COLLÈGES*
(preparatory grade and lower cycle only)
(in hours per week)

Subject	Grades			
	Preparatory	I	II	III
Turkish language	[1]4	[1]6	4	4
History	–	2	2	2
Geography	–	2	2	2
Civics	–	1	1	1
Mathematics	–	5	5	5
Physical and natural sciences	–	4	6	6
English	[2]25	8	8	[3]8
Drawing	1	1	1	1
Music	1	1	1	1
Physical culture	1	1	1	[4]1
Handwork	–	1	1	[5]1
Total	32	32	32	32

1. One hour a week is devoted to penmanship, under the supervision of the Turkish language teacher or the drawing teacher.
2. From the second half-year, 4 of the 25 hours of English are set aside for physical and natural sciences and 3 for mathematics. These lessons are given in English, by an English language teacher or a science teacher, according to circumstances. For the English, mathematics and science lessons, a single mark is given. If there are several teachers for these lessons, the average of the marks awarded by them is taken.
3. Two of the 8 hours of English are devoted to conversation.
4. More time is given to sports activities outside school hours.
5. The drawing hour and the handwork hour are combined and the resulting 2-hour period devoted alternately to each subject.

The certificates awarded by the *collèges* are equivalent to those issued by the intermediate schools and upper secondary schools. In regard to administration, appointment of teachers, curricula and examinations, the regulations in force for the *collèges* are the same as those applying in intermediate schools and upper secondary schools.

The Bahçelievler Experimental School (Ankara) and the Atatürk Experimental School (Istanbul). These schools have more or less the same curriculum as the intermediate schools and *liseler* but they apply different methods and follow a different plan of studies. The subjects taught in the second cycle are the same as those of the ordinary *lise*, but a further four hours are devoted weekly to the study of English and, in addition, psychology, philosophy, logic, mathematics and the physical and natural sciences are taught in that language.

If the results achieved in these experimental schools prove to be better than those achieved in the ordinary *liseler*, their methods and study plans will be generally applied in secondary establishments.

At the experimental school in Istanbul, the course extends over 6 years and is divided into two cycles of 3 years each. A characteristic of the curriculum is the distinction made between compulsory and optional subjects. Throughout the 3 years of the first cycle the same number of hours per week (4) is devoted to each of the five compulsory subjects (Turkish language, social studies, physical and natural sciences, mathematics, hygiene and physical culture). The optional subjects are as follows: foreign language (4 or 6 hours weekly), music, drawing and handwork, dressmaking and cutting, cooking, domestic economy, infant and child welfare, first aid and office work (2 hours for each of these subjects). The number of hours devoted to optional subjects must not exceed 8 per week. In addition, pupils have another 6 hours' work under supervision in library, laboratory, workshop, etc., and an hour for social activities. The weekly time-table for each class therefore covers 34 hours. In the second cycle optional subjects take up 4, 8 and 16 hours per week in the first, second and third years respectively. There is a wider range of subjects to choose from. The pupils' choice is conditioned by the career they intend to take up.

At the experimental school in Ankara, the course is also divided into two cycles of 3 years each and the system of optional subjects is likewise applied. The upper cycle comprises five branches: arts and social sciences, natural sciences, mathematics, commerce, domestic economy. The syllabus for each branch includes a certain number of compulsory subjects; these are supplemented by optional subjects, chosen by pupils from a list common to all grades and sections. Both schools are still at the experimental stage. The Ankara school (Bahçelievler Lisesi) is co-educational; the Istanbul school (Atatürk Lisesi) is for girls only. The regulations governing examinations are modelled on those of the American Comprehensive School.

Schools for imams *and preachers.* These schools come under the authority of the Directorate-General of Secondary Education and their purpose is to train men to serve the Muslim religion. They accept holders of the primary school leaving certificate. The course is divided into two cycles, the first lasting 4 years and the second 3. The teaching, though partly religious, is approximately of the same level as that given in the upper secondary schools. The certificate awarded at the end of the first cycle is equivalent to the intermediate school leaving certificate and that awarded at the end of the second cycle is equivalent to the upper secondary school leaving certificate. However, these certificates do not entitle their holders to enter universities or higher schools. The regulations governing schools for *imams* and preachers are the same as those applying to intermediate schools and upper secondary schools. The teaching staff is the same as that of upper secondary schools, except for the theologians, whose competence is recognized by the Ministry and who are responsible for the teaching of religious subjects. Turkey now has 19 schools for *imams* and preachers.

The Galatasaray School. This school (of upper secondary level), comes under the Directorate-General of Secondary Education and resembles the ordinary *liseler*, but it is worthy of separate mention on account of two peculiar features. It is the oldest of all the Turkish *liseler* (the first Imperial school), which gives it the dual privilege of

providing both primary education (5-year course) and secondary education (7-year course) and of teaching in two languages (Turkish and French). Pupils are admitted to the first grade after taking a series of tests and usually obtain their school leaving certificate at the end of the twelfth year. Boys who have received their primary education at a school other than that attached to Galatasaray may also sit for an entrance examination; if they pass, they spend a year in a preparatory class, after which they take the secondary course and finish their studies at the end of 7 years. The pupils learn French either in the primary course or in the preparatory class; they then take the science and mathematics lessons in the secondary course in French. In the last two grades, psychology and philosophy are likewise taught in French. The school is governed by the same regulations as the ordinary *liseler*. Owing to the way in which this school is organized, the teaching staff includes both Turkish and French teachers. The Turkish teachers must have the same qualifications as their colleagues in other establishments. The French teachers are engaged by contract, on the proposal of the French Government and with the approval of the Turkish Government, which accepts responsibility for them. The duration of the contracts may be extended with the consent of both parties.

At the Galatasaray School, the first cycle (intermediate school) covers 3 years and the second cycle covers 4 years; there is also a commercial section with a 4-year course.

Istanbul Lisesi. This establishment closely resembles the Galatasaray School, but it offers no primary course and it uses German instead of French.

Vocational and technical schools

Technical institutes for girls. Turkey now has 85 of these institutes, which offer a 5-year course following on from the primary school. They come under the direct authority of the Under-Secretariat of State for Vocational and Technical Education. All of them are day schools and no fees are charged. In the three grades of the first cycle, the curriculum is much the same as that applied in intermediate schools, with emphasis on preparation for their future role as housewives. In the last two grades, which form the second cycle, more time is given to vocational and technical training and to practical work. For pupils who have already completed their intermediate studies, there are special classes in place of the two grades of the second cycle; in these classes the whole time is devoted to vocational and technical training. The certificate awarded, following the leaving examinations, are the same for both categories of pupil.

The main purpose of these institutes is to train women to become capable and conscientious housewives and enlightened mothers able to bring up their children in accordance with modern methods. It is also possible for pupils to continue their education at the higher level, for instance, by entering the technical teacher training school for women. In that case candidates are nominated by the school at which they completed their secondary studies and take an entrance examination; successful candidates study for a further 4 years at the school and then become probationer teachers. They start at the second grade of the scale of salaries for civil servants and are entitled to a promotion after 4 years. They thus form the teaching staff in the technical and vocational branches of the institutes for girls. The general subjects are taught by intermediate and upper secondary school teachers.

Holders of leaving certificates from these institutes may also, if they express the wish to do so, go on to an upper secondary school or to a primary teacher training school, or enter the civil service.

In so far as administration, appointment of teachers and examinations are concerned, the institutes for girls are governed by the same regulations as secondary schools.

Technical night schools for women and girls. Any literate person between the ages of 12 and 45 may take the courses provided by these establishments, most of which are incorporated in the technical institutes for girls. There is no set curriculum; various courses are arranged, according to the wishes of the local population. The instruction is given by teachers from the institutes.

Technical institutes for boys. There are 80 of these institutes, which comprise five grades, following on from the primary school. As in the institutes for girls, the course is divided into two cycles. The first cycle—or intermediate technical school for boys—is formed by the first three grades; its purpose is to train specialized workmen while providing general education. The second cycle, which extends over 2 years, trains skilled workmen and foremen for the various branches of modern industry.

The technical institutes come under the authority of the Under-Secretariat of State for Vocational and Technical Education. They are day schools and no fee is charged. The second cycle includes special classes reserved for pupils who have gone through an intermediate school. The certificates awarded to these pupils give them the same rights as are enjoyed by pupils who have taken the whole course at the technical institute.

These institutes are governed by the same regulations as the *liseler*. The teaching staff is recruited from among former students of the technical teacher training school for men; the non-technical subjects are taught by intermediate and upper secondary school teachers; in addition, specialized foremen with industrial experience are engaged for the supervision of practical work.

The second cycle of the course now includes training in 16 different branches of industry. Three subjects—forging, laminating and joinery—are compulsory at all technical institutes. Other subjects are selected according to local needs. On completing the course, pupils may open workshops or take up employment as specialized workmen or foremen. They may also go on to a technical teacher training school, a school of engineering or a technicum, subject to passing a competitive entrance examination. If they enter a factory or workshop, their wages are determined by law. Those who wish to continue their studies at a *lise* are placed on the same footing as pupils who have gone through an intermediate school.

Building trades institutes. These establishments, which come under the Under-Secretariat of State for Vocational and Technical Education, train skilled workmen and

Total	44	44	44	44

1. German, English.
2. Special classes reserved for holders of the intermediate school certificate, who spend more time on practical work.
3. Varying according to the section (metallurgy, mines, electricity, textiles).

foremen for the building trades. The 5-year course, which follows on from the primary school, is divided into two cycles. Pupils who leave at the end of the first cycle (3 years) may take up employment as skilled workmen; those who finish the course are qualified to work as foremen.

The institutes of the building trade, of which there are six, take both day pupils and boarders; they make no charge for instruction. Pupils are recruited by means of a competitive entrance examination open to holders of the primary school leaving certificate. Those who complete the first cycle at an institute (intermediate school of the building trade) are automatically admitted to the second cycle. Where the workshop situation allows, special classes are organized for holders of the intermediate school leaving certificate.

The curriculum for the first cycle of the institutes of the building trade is the same as that for the first cycle of the technical institutes. On the practical side, there are sections for carpentry, masonry and plumbing, whilst, in the last two grades, sections for plaster-work, marble-work and central heating are also included.

Graduates from the institutes of the building trade may continue their studies at an engineering school, a technical teacher training school or a technicum, subject to passing the competitive entrance examination. If they receive a government grant, they are expected to work for the State for a certain time.

Institutes for training in chemistry. These establishments, which offer a 5-year course following on from the primary school, train laboratory assistants and chemical engineers' assistants. The curriculum for the first year is the same as that for the first year of the technical institutes. Pupils who obtain a credit or distinction at the end of their first year at a technical institute are therefore accepted, if they so wish, for the second year in the chemistry institutes, with a government grant. They receive approximately the same training as in the technical institutes, but in addition do specialized courses in workshop and laboratory and learn to repair the apparatus they use in this work. Fourth-year and fifth-year pupils have to work in a factory or laboratory in the months of June and September.

Printing school. This school, which is at Istanbul, offers a 3-year course. It recruits its pupils from among holders of the intermediate school leaving certificate or the certificate of the first cycle of the technical institutes. It trains specialists in the various branches of the printing trade. It is governed by the same regulations as those applying to the technical institutes.

Institutes for automobile mechanics. There are two such establishments, one at Izmir and the other at Ankara. They offer a 2-year course and recruit their pupils from among holders of the intermediate school leaving certificate or the certificate of the first cycle of the technical institutes. The weekly time-table, which is similar to that of the technical institutes, includes in addition, for the first year, practical work on car bodies and chassis and, for the second year, practical work on motors and electricity.

Commercial schools. The purpose of these schools is to train staff for the various branches of the country's economic and commercial life. The course, which is co-educational and free, comprises two cycles, each of 3 years. The first cycle is open to pupils who have completed their primary education, the second to holders of the intermediate school leaving certificate or the certificate of the first cycle of the commercial secondary school. Until recently, pupils coming from an intermediate school had to spend a year in a special class; that class has now been abolished, but these entrants have to attend extra lessons until the end of the second year to fill in the gaps in their knowledge. In both cycles, teaching is given in the morning. In the afternoon pupils do work relating to the occupation they have chosen.

On passing the final examinations, pupils may enter the School of Higher Commercial Studies. In order to enter a university they must pass the leaving examination of a

general upper secondary school. Those who complete the course at the School of Higher Commercial Studies have the same rights as university graduates.

The teaching staff is recruited in the same way as for general upper secondary schools, except that the teachers of special subjects are graduates of the Higher Commercial Teacher Training School or the School of Higher Commercial Studies.

Commercial night schools. These schools have been set up for young people who have completed their intermediate studies and who have to work in the daytime. Some are independent whilst others are incorporated in day schools. A 36-week course is given on each of the subjects included in the curriculum of the commercial secondary schools. The syllabus covers 3 years, with 24 hours of lessons per week.

Courses are organized only when there is sufficient demand for them. The school year is divided into two terms. Attendance at lessons is compulsory. The examinations at the end of the first term are held by the teacher in charge of the course; those at the end of the second term by a jury composed of three teachers. A passmark is required, and a certificate is issued for each subject in which the candidate passes. Candidates who pass in all subjects obtain the commercial secondary school leaving certificate.

Academy of Fine Arts. This establishment, at Istanbul, comes under the Directorate-General of Fine Arts of the Ministry of Education. It has four sections, each divided into two cycles—an intermediate and a higher one. The intermediate cycle extends over 3 years for the three main sections (painting, sculpture and decorative arts) and 4 years for the section of Turkish decorative arts. Pupils are recruited by means of an entrance examination open to holders of the intermediate school leaving certificate or the certificate of the technical institutes.

Those who pass the examination at the end of the third year obtain the Academy of Fine Arts intermediate certificate and, for salary purposes, are placed in the same grade as holders of the general upper secondary school leaving certificate. They are not qualified to enter a university, but they can be admitted to the higher cycle of the Academy of Fine Arts. On the other hand, pupils coming from a general upper secondary school must sit for an examination before being admitted to the higher cycle of the academy.

The teaching staff is recruited from among university graduates and former pupils of the academy or from among specialized foreign teachers. Each teacher has a studio at his disposal.

The Academy of Fine Arts also has a section for architecture, but this comes within the category of higher education, and only holders of the general upper secondary school leaving certificate are admitted to it.

National Conservatory at Ankara and the National Conservatory at Izmir. The National Conservatory at Ankara, which was founded in 1936, also comes under the Directorate-General of Fine Arts. It has several sections—piano and harp, stringed instruments, wind instruments, singing, drama, etc. The length of the courses in these different sections varies from 5 to 9 years, divided into several cycles. Pupils are recruited by means of a competitive entrance examination; the conditions of admission vary according to the section.

Both the Ankara Conservatory and the Izmir Conservatory are co-educational. They accept day students and boarders. For salary purposes, graduates from a national conservatoire enjoy the same rights as holders of the general upper secondary school leaving certificate, but they are not qualified to enter a university.

The regulations in force are exactly the same as those applied in other secondary establishments.

The teaching staff is recruited partly from among teachers in general intermediate and upper secondary schools, but chiefly from among the best musicians and other artists in Turkey and elsewhere.

Teacher training schools

Turkey now has 52 establishments for the training of teachers to serve in primary schools. They come under the Directorate-General of Teacher Training. In 21 of them the course lasts for 6 years and in the other 31 it lasts for 3 years. At the former, students are recruited from among holders of the primary school leaving certificate, and at the latter from among holders of the intermediate school leaving certificate; in either case candidates must take a competitive entrance examination. Two of the schools with a 6-year course and 14 of those with a 3-year course are for girls only; the others are for boys. With the exception of two, which were opened quite recently, all primary teacher training schools have boarding arrangements. No charge is made for board and lodging. As far as possible, day pupils are also accepted, provided they have passed the entrance examination. On completion of their training, boarders are obliged to teach for a certain number of years, which may be twice the length of the course. Newly qualified teachers begin their service by a probationary period of from 1 to 3 years, except for those whose ability has been recognized by their superiors and who become established forthwith; they begin at the same grade in the salary scale as the students graduating from a *lise.*

In the first 3 years of teacher training schools with a 6-year course, students receive the same general education as pupils in intermediate schools. In the last 3 years, however, while broadening their general culture they receive the professional training required for the career they have chosen. In the course of their studies they also have many opportunites of visiting primary schools and thus becoming acquainted with the establishments in which they will serve and the children with whom they will have to deal. Sometimes they are even given classes to teach, but under the supervision of qualified teachers. In their final year, the students do a month's practical work in a rural school. The marks they receive for this period are taken into account in the final examinations.

The regulations governing primary teacher training schools are exactly the same as those for intermediate schools and upper secondary schools. The teaching staff is also recruited in the same way. It is now proposed to appoint the best teachers to primary teacher training schools.

Men and women primary teachers are entitled to sit for the competitive entrance examination for intermediate teacher training schools so as to become secondary school teachers. From the school year 1959/60, the best among them will be accepted in higher teacher training schools; they will thus have the right to pursue university studies—a right which they have not hitherto enjoyed.

TRENDS AND PROBLEMS

As will be seen from the foregoing, the efforts made in regard to secondary education since the proclamation of the Republic have produced abundant results. Since 1923 the number of secondary schools of teachers and of pupils has continually increased. Intermediate and upper secondary schools, and even technical and vocational schools, are now being opened in the remotest villages of Anatolia. Nevertheless, much obviously remains to be done if secondary education is to be made universal in a country as big as Turkey where even primary education was long neglected. To fulfil this aim, it is proposed, among other measures: to establish new secondary schools in both large and small towns; to bring the various types of secondary school into harmony with the needs of the population and local conditions (multilateral intermediate schools, unification of the curricula of all intermediate schools); to put up many new school buildings in towns and villages (this is necessary not only in places where there are as yet no secondary schools, but also in those where the schools are overcrowded) and to restore a certain number of old buildings; to train increased numbers of new teachers, on the one hand to fill the gaps caused by deaths and retirements and, on the other, to teach in the new schools and help reduce the size of overcrowded classes; lastly, to increase the number of inspectors, in keeping with the increase in the number of schools, teachers and pupils, and to strengthen the administrative staff.

To provide for the expansion of the teaching staff a second higher teacher training school is being opened in Ankara for the school year 1959/60, while at the same time the intermediate teacher training schools at Izmir and Diyarbakir will be receiving students to train as teachers for secondary schools. (These are in addition to the intermediate teacher training schools already functioning at Ankara, Istanbul, Balikesir and Bursa.)

As the implementation of all these projects will require much larger funds than are now available, further resources must be found. This problem is the most difficult of all.

The Minister of Education has set up a commission, consisting of representatives of all the departments of the Ministry and representatives of the universities, to visit foreign countries and make a detailed study of their educational systems, with the object of preparing a report to serve as a basis for the recasting of the Turkish educational system. This report will be submitted for consideration to the Council of Instruction and Education, as the sole authority empowered to make decisions relating to education. The council's proposals will then be submitted to the Minister for approval. The implementation of the council's decisions will be a matter for the various departments concerned.

There is no doubt that the present educational system in Turkey is out of date; even the countries which Turkey took as models have now completely changed their systems. Turkey, too, has made some changes, but in competent quarters the view is held that a complete recasting of the system has become a necessity.

STATISTICS

Population (mid-year 1958 estimate): 25,932,000.
Area: 299,993 square miles; 776,980 square kilometres.
Population density: 8 per square mile; 33 per square kilometre.

Summary of school statistics, 1953–57. In the school year 1957/58 there were more than 2,600,000 students enrolled in schools at all levels, representing over 10 per cent of the population. There were, in addition, some 59,000 adults attending educational courses of whom 57 per cent were women. Of the school-going population (excluding adults), over 86 per cent were pupils in primary schools, 9 per cent in general secondary and teacher training courses, 3 per cent in vocational schools and under 2 per cent were students at higher educational institutions. Girls made up 38 per cent of the enrolment in primary schools, 26 per cent in general secondary schools, 23 per cent in vocational education and 16 per cent at higher educational institutions.

The teaching staff numbered over 68,000 in 1957/58. One quarter of the teachers were women in primary schools, 40 per cent in general secondary schools and 18 per cent at universities. The pupil-teacher ratio in primary schools was 48 in 1957/58 compared with 46 at the beginning of the period under review and 21 in general secondary schools against only 16 in 1953/54. Compared with 1953/54, enrolment had increased by 29 per cent in primary schools, by 88 per cent in general secondary schools, by 47 per cent in vocational education and by 81 per cent at university level. (See Table 2.)

Trends in secondary education, 1930–57. Average enrolment in all secondary schools was five times higher in the three years 1955–57 than in the years 1930–34. Over the same periods the ratio of secondary enrolment to the estimated school age population 15–19 years old increased from 5 to 12. The proportion of girls enrolled in general and vocational secondary education was around 25 per cent throughout the period under review. In teacher training schools, however, the proportion of women students declined from about half in the years 1930–39 to under 12 per cent of the total in the period 1950–54. (See Table 1.)

Examination results in secondary education, 1953–57. In 1957/58, the diploma of general secondary school studies (*Mezuniyet* or *Baccalauréat*) was passed by 54,938 students of whom 13.576 or one-quarter were girls, compared with 32,299 passes in 1953/54. The number of successful candidates thus increased by 70 per cent over the five years under review, but the proportion of girls to total candidates did not rise appreciably.

Educational finance 1958/59. In 1958/59 the budget of the Ministry of Education amounted to 738,792,847 liras of which 327,589,707 liras were allocated for primary education. (Official exchange rate: 1 lira = 0.36 U.S. dollar (approx.). Expenditure on education made by provincial authorities is not known.

1. Probably including teacher training at secondary level. In the school year 1958/59 there were 21,260 students in teacher training schools.
2. Probably including higher teacher training. In 1958/59 there were 1,008 students in higher teacher training colleges.
3. There were in addition 41 schools for backward children and orphans. No information on enrolment or teachers is available.
4. Number of schools only.
5. Not including teachers of trade schools or courses.

THE EDUCATIONAL SYSTEM

Prior to the Great October Socialist Revolution there were only 577 secondary schools in the Ukraine, and the teaching was given exclusively in Russian; not one school provided instruction in the Ukrainian language. The children of the workers could not attend these schools, which were only for the children of the well-to-do. A considerable proportion of them were private institutions, which charged much higher fees than the government schools. There were separate schools for the children of the nobles and the clergy, etc. Thus secondary education in the Ukraine, as in the whole of pre-revolutionary Tsarist Russia, clearly reflected class distinctions.

The October Revolution brought with it radical changes in the system of public education. On 16 October 1918 the Government Declaration and Regulations establishing one school system for the workers was promulgated. On 28 February 1919 fees were abolished in all schools without exception, and in April of the same year it was decided that private schools should be closed and the whole educational system brought under state control. The Church was to be separate from the State, and the school from the Church. As a result of the establishment of a single unified system of public education, from the kindergarten to the university, all children enter the same type of school and begin their education on an equal footing, and they all have the right to go on to the highest stages in the school system.

The decisions taken by the Communist Party and the Soviet Government in the early 1930s were of great importance in the development of public education. By the resolution 'On the structure of primary and secondary education in the U.S.S.R.', which was promulgated on 15 May 1934, the Central Committee of the All-Union Communist Party (Bolsheviks) and the Council of People's Commissars of the U.S.S.R. established the basic types of schools for general education (primary, 7-year, and 10-year secondary schools), which were to be uniform throughout the Soviet Union. The establishment of general secondary schools was a new stage in the development of public education, although even before 1934, work had started on converting 7-year schools to secondary schools.

Just before the second world war, education in the Ukraine had reached a high standard. In the school year 1940/41, there were about 31,000 schools in the Republic, including 4,435 secondary schools and 10,957 7-year schools. The number of pupils was 2.6 times greater than in 1914/15, and the number of teachers was 3.5 times greater. There were nearly 8 times as many secondary schools, particularly in the country districts, where the number has increased more than a hundredfold. The transition to universal 7-year education had begun, and in the cities universal 10-year education was being introduced.

In the post-war years, the network of schools was re-established, and 7-year and secondary education developed rapidly. At the beginning of the 1958/59 school year, there were 8,446 general secondary schools in the Ukrainian S.S.R., with 1,028,200 pupils in the higher classes, including 261,200 young workers, studying either at 'evening schools' which also provide day classes for shift workers, or by correspondence.

The Soviet school has played an active part in bringing about a cultural revolution in the country, in developing the people's talents and in educating the young people in a progressive spirit. Nevertheless, the general secondary schools, the vocational and technical schools and the special secondary schools of the Ukrainian S.S.R. do not satisfy the requirements of society at a time when Communism is being extensively built up. The principal weakness in the work done by the schools—as was noted by the Twenty-first Congress of the Communist Party—is a tendency for the instruction to be divorced from life, so that pupils leaving school are not sufficiently prepared for practical life. This situation led to the suggestion that the system of public education should be reorganized. In April 1959, the Supreme Soviet of the Ukrainian S.S.R. enacted a law 'On the strengthening of the links between school and practical life, and on the subsequent development of the public education system in the Ukrainian S.S.R.'.

Under the Law of 1959 all children between the ages of 7 and 15 or 16 must complete 8 years of schooling. At the 8-year school, pupils acquire a sound basic knowledge of general and polytechnical subjects, are brought up to like work and to be ready to devote themselves to socially useful activity, and are given moral, physical and aesthetic training. The 8-year school is concerned with general education; it does not seek to train specialists for any particular profession.

Senior secondary education, which begins at the age of 15 or 16, is based on a combination of instruction and work in industry.

When they have completed the 8-year school, young people may choose for themselves which path they will follow to obtain a complete secondary education. For those who do not wish to interrupt their productive work, there are the evening (shift) schools. In these schools, persons who are employed in one of the branches of the national economy can obtain a secondary education and improve their professional qualifications; the courses are of 3 years' duration. (Since, for various reasons, some workers have not completed their compulsory schooling, these schools at present also provide courses beginning from the third grade.)

Pupils who have completed the 8-year course may also enter the 'secondary labour polytechnical school providing a general education together with production training' (hereinafter referred to as the senior secondary polytechnical school). The course is of 3 years' duration, and comprises general secondary education and vocational training for work in one of the branches of the national economy or

culture. Senior secondary polytechnical schools are sometimes run in conjunction with the 8-year schools and sometimes separately, taking pupils in grades 9 to 11.

A further possibility, for those who have completed the 8-year school, is to enrol at a technicum or other specialized secondary educational establishment.

Besides these schools, there are secondary schools in which the instruction in certain subjects is given in foreign languages, and others which are for children with special aptitudes for music, choreography and the fine arts.

There is also a wide network of boarding schools in the Republic, organized as 8-year or senior secondary polytechnical schools. These boarding schools, which were first instituted in 1956, are well equipped and staffed with experienced teachers, and provide particularly favourable conditions for the instruction and education of the pupils. The network of boarding schools is growing rapidly. In 1958, pupils at these schools numbered 24,000, but it is expected that enrolment will reach 420,000 by 1965.

In the Ukrainian S.S.R., therefore, everything possible is done to ensure that young people who have completed the course at an 8-year school may obtain a complete secondary education (general or specialized) either by interrupting their industrial work or by combining their secondary school studies with work in industrial undertakings, institutions, agriculture, building, transport and other branches of the national economy of the Republic.

The reorganization of the public education system, in accordance with the schools law, was begun in 1959, and will be completed within the next four or five years. It will promote a considerable expansion of secondary education in the Ukrainian S.S.R. in the future. The number of general secondary schools will increase by more than 400 in seven years, and the number of pupils in the senior classes will increase by nearly 700,000.

The Constitution of the Ukrainian Soviet Socialist Republic lays down that all citizens have the right to education. This right is secured by a number of measures—the provision of compulsory general 8-year education, a well-developed system of general secondary polytechnical education, vocational and technical education, specialized secondary and higher education, the development of various types of evening schools and correspondence courses; the provision of all types of education without payment; the system of state scholarships; the use of the pupils' native language in the schools; and the organization of free industrial, technical and agricultural instruction for workers in the factories, state farms and collective farms.

Administration

All secondary schools and other educational establishments which provide a secondary education are fully guaranteed by the State; they are financed through the state budget, and are under the control of the Ministry of Public Education of the Ukrainian S.S.R. (for general secondary schools), the Ministry of Culture of the Ukrainian S.S.R. (for schools of music and fine arts) and the Ministry of Specialized Higher and Secondary Education of the Ukrainian S.S.R. (for technicums and other specialized secondary education establishments).

The Ministries referred to work out and approve the educational plans and curricula for secondary schools, publish school textbooks, and provide the schools with visual aids for use in the classroom.

The planning of the general secondary school network is done by the Ministry of Public Education and its local organs, which arrange for new secondary schools to be opened where justified by the number of pupils, or for 8-year schools to be reorganized to provide full secondary education, or for any other changes to be made in the school network. New secondary schools are opened (and in some cases closed) only with the consent of the Ministry of Public Education and subsequent confirmation by the Council of Ministers of the Ukrainian S.S.R.

Supervision and inspection. The work done by the general secondary schools is supervised by the Ministry of Public Education, and by the regional and district departments of public education.

In some of the local Soviets of workers' deputies (regional, city, settlement and village Soviets), permanent commissions are formed from among the deputies, to deal with questions of public education. They assist the Soviets, their executive committees and the public education departments in organizing the educational work of the schools on a sound basis, make suggestions regarding the development of the school network, encourage young people working on collective farms or in industry to attend the evening schools, and arrange for improvements in school facilities and equipment.

All schools, including secondary schools, are supervised by school inspectors, who are attached to the public education departments and the Ministry of Education. They are selected and appointed from among the most experienced teachers and administrative staff of the schools, who have very high educational qualifications and the necessary length of service as teachers. In the case of an inspector working for a district (or municipal) public education department, this is a minimum of 5 years; in the case of an inspector working for a regional public education department, a minimum of 7 years; and in the case of a Ministry of Education inspector of school administration, a minimum of 10 years.

A school inspector attached to a district or municipal public education department exercises state control over the standard of the teaching and general education in the schools assigned to him, ensures that the teaching embodies the results of the best educational experience and keeps the teachers informed of advances in educational science, and checks whether proper use is being made of school equipment.

Besides supervising schools, the regional inspector also supervises the activities of the district (or municipal) public education departments, while the Ministry of Education inspector supervises the work of the regional public education departments.

Finance. Secondary education in the Ukrainian S.S.R. is free. The full cost of maintaining secondary schools is financed from the state budget, which is established annually in accordance with the local requirements of each region of the Republic. Under the state budget provision is made for the payment of the salaries of the teaching staff, the

maintenance of school premises, capital repairs to school buildings, equipment, school supplies and other expenses, and also for making available free living quarters and public utilities to teachers in country districts and for the maintenance of school boarding premises.

Funds for all these purposes are allocated to the regions and districts of the Republic according to the number of schools and pupils they have.

Buildings and equipment. Schools are always built to standard designs prepared in accordance with established norms. School buildings for 320, 400, 520 and 960 pupils are planned to occupy one, two, three or four floors respectively. An average of about 700 cubic feet is allowed for each pupil, and a total area of about 50 square feet. Besides the classrooms, each of which is over 500 square feet in area, secondary school buildings include chemistry and physics laboratories, mathematics rooms and drawing rooms, rooms for literature and foreign languages, history and geography, a library, a methods room, teachers' rooms, gymnasia and assembly halls, a canteen and other rooms.

All schools are centrally heated. The buildings are equipped with electric light, running water and sewerage. In places where there is neither running water nor sewerage, artesian bores or wells are sunk, and sanitary facilities are provided, with special purifying installations (an underground sewage-farm or a complete biological purification system).

TYPES OF SECONDARY EDUCATION

As mentioned above, all young people who have completed 8 years' schooling (7 years' schooling up to 1959) may enter various types of secondary schools—schools for young workers in town and country, evening schools for shift workers, senior secondary polytechnical schools and technicums and other specialized secondary schools.

General secondary schools for young workers

By attending the schools for young workers in town and country for 3 years (grades 9, 10 and 11), young people obtain a general education comparable with that of pupils at secondary schools which provide industrial training.

In schools for urban workers, the year begins on 1 September and ends on 29 May—that is, it lasts for 9 months. The school week comprises 22 hours' instruction, which includes 2 hours' tutorial work. The curriculum provides for the study of the Ukrainian and Russian languages and literature, algebra, geometry, trigonometry, natural science, history, geography, physics, astronomy, chemistry, a foreign language and drawing. Some time is also devoted to improving the pupils' vocational qualifications.

In the schools for young people in the villages, the year runs from 1 October to 12 May, that is, for seven and a half months, as the pupils are engaged in agricultural work in the summer and autumn. The school week comprises 22 hours, and the instruction covers the same subjects as in the schools for young urban workers. As well as general subjects, the pupils study the rudiments of agricultural production.

Besides the evening schools for young urban and rural workers, there are secondary correspondence schools in the Ukrainian S.S.R., which give young workers a general secondary education. The courses are planned to occupy 9 months (from 1 September to 24 May). Pupils study the subject-matter in the curriculum by themselves, and the school helps them by regular group or individual tutorials.

For both the evening schools for young urban and rural workers and for correspondence schools, the Ministry of Public Education draws up special curricula and textbooks, which maintain a proper standard of general education, with due regard for the age of the students, and their experience of life and productive work.

The senior secondary polytechnical school

In the senior secondary polytechnical schools pupils take a 3-year course of instruction (grades 9, 10 and 11) which provides a general secondary education and vocational training for work in one of the branches of the national economy or cultural life. The school year begins on 1 September and ends on 29 May, thus lasting 9 months, and the school week comprises 37 hours. The subjects studied are Ukrainian and Russian literature, algebra, geometry, trigonometry, physics, astronomy, chemistry, natural science, geography, history, a foreign language, drawing, music, singing and physical education. In addition, industrial training is provided (at present, the time allotted to this is 5–6 hours a week, but in future it is to be 12 hours a week), in the course of which the pupils acquire theoretical and practical knowledge of the particular type of work they have chosen to do in industry, agriculture, transport, communications or general services. Industrial training, together with the acquisition of practical knowledge of a particular branch of work, helps the pupil to a better grasp of the basic principles of the sciences.

Some idea of the content of the general subjects taught is given below:

Ukrainian and Russian literature. Pupils study the principles of the history of literature (mainly the nineteenth and twentieth centuries), together with the rudiments of the literary history of the peoples of the U.S.S.R. and the history of foreign literature.

A foreign language. The subject is taught with a practical end in view, namely to develop the ability to converse in the foreign language, on the basis of the knowledge acquired in the 8-year school, and to teach the pupils to read correctly, understand, and, with the help of dictionaries and grammar books, translate into their own language fiction, social and political texts, and popular science works and technical literature.

History. Pupils pursue a systematic course of study in the history of the U.S.S.R., and in the modern and contemporary history of foreign countries.

Geography. Covers the economic geography of foreign countries and of the U.S.S.R.

Mathematics. Pupils complete their study of elementary mathematics, and acquire the knowledge, skills and practice required for vocational training and practical work in modern industrial conditions and for further study at university level.

Physics. The course covers mechanics, molecular physics,

heat and energy, electricity and magnetism, optics and atomic structure.

Astronomy. The nature, movement and development of the heavenly bodies, the place of the earth among them and the structure of the universe, and the practical application of astronomy.

Chemistry. Pupils acquire sound, systematic knowledge of the elements of general and organic chemistry.

Natural science. The course covers the basic principles of Darwinism, bringing together the pupils' knowledge of botany, zoology, anatomy and human physiology. The pupils learn about the origin and historical development of life on the Earth, the evolution of the organic world, and the principles of the control of vegetable and animal organisms, their development and formation.

Drawing. The course is designed to equip pupils with the knowledge and skills required for preparing and understanding technical drawings, and to develop their notions of spatial relations.

Physical education. Includes gymnastic exercises appropriate to the pupils' physical development, field and track athletics, swimming, instruction in skiing, and games.

In the senior secondary polytechnical schools, as also in the schools for young industrial and agricultural workers, emphasis is laid on various types of independent work performed by the pupils, observation of nature and production processes, excursions, practical and laboratory work, including elementary research, etc. The object of the whole educational process in the secondary school is to equip pupils for life and socially useful work, to give them sound general and polytechnical knowledge, and to produce educated people, active builders of communist society, with a good knowledge of the elements of science and a profound respect for work as the source of all the material and cultural values of society and the primary necessity of man's life, and inspired by the principles of internationalism and humanism.

Methods of encouraging secondary school pupils to engage in productive work, such as pupils' brigades in the collective farms and state farms and pupils' construction brigades, are widely used throughout the Republic.

In order to bring pupils up to be industrious, and to train them in habits of regular work, schoolchildren in the Ukrainian S.S.R. are encouraged to practise self-help. The pupils have a roster for keeping the school premises and farmstead in order and looking after the plants; they help to prepare visual aids and keep them in good order, repair books, and perform various other tasks.

Secondary school pupils are promoted to the senior classes on the basis of promotion examinations and their performance during the year. At the conclusion of the secondary school course, pupils sit for school-leaving examinations, and successful candidates receive a secondary education certificate, which qualifies them for admission to higher educational establishments. Those leaving the senior secondary polytechnical schools also receive a certificate of their qualifications in the particular branch of industrial work in which they have been trained.

Gold and silver medals are awarded to boys and girls who have been outstanding in their secondary school work, who have excelled in practical industrial work (carrying out their full work quota in their industrial training), and who have set an example of good behaviour and taken an active part in social work.

Secondary school staffs are recruited from among people who have received an advanced training in education (i.e., graduates of one of the pedagogical institutes or of a university). Appointments to teaching posts in secondary schools, and transfers, are made by the regional public education departments.

Specialized secondary schools

In these institutions, special subjects are studied, as well as general educational and general technical subjects. Specialized training is open to all citizens of the U.S.S.R., regardless of sex, nationality or religious belief. The languages of instruction are Ukrainian and Russian.

All specialized secondary educational establishments come directly under the Ministries, Departments and Councils of National Economy of the economic administrative districts. General supervision and methodological direction is in the hands of the Ministry of Higher and Specialized Secondary Education of the Ukrainian S.S.R., as well as of the divisional offices and boards of the educational institutions controlled by the various Ministries, Departments and Councils of National Economy.

The training courses for skilled workers in specialized secondary educational institutions follow on from the 8-year school course and last 4 or 5 years, although certain specialists have to complete the full secondary course and then undergo three or three and a half years' training.

Attention is paid to the need for bringing vocational and technical education into line with industry, and to the need for workers for the national economy and the cultural life of the Republic.

Specialized secondary education in the Ukraine began early in the nineteenth century. At first, specialists were trained chiefly to work in education and agriculture, and it was not till the end of the century that provision began to be made for technical secondary education. Whereas in 1914 there were only 88 specialized secondary educational institutions in the Ukraine, with a total enrolment of 12,500 pupils, by the beginning of the year 1958/59, there were 588 such schools, with a total enrolment of 351,128.

The Gosplan (State Planning Committee) of the Ukrainian S.S.R. draws up overall plans for the training of skilled workers. For intermediate level technicians the State lays down standard syllabuses for training for industry, building, transport and agriculture in the technicums; and for public health, education and culture in the colleges.

Young people are admitted to the day courses in technicums and colleges up to the age of 30, but there is no age-limit for admission to the evening and correspondence courses for people engaged in industrial work.

Students are enrolled annually in the technicums and colleges of the Ukrainian S.S.R., in accordance with the rules of admission and the plans approved by the Ministries, Departments and Councils of National Economy. Three months before the end of the course, students in their final year at specialized secondary educational institutions are appointed to posts in the branch of the national economy corresponding to their special qualifications.

In industrial technicums with a 4½-year course, the curriculum provides for the following allocation of instruction time: general education, 1,500 hours; general technical education, 780; specialized work, 1,430; physical training, 230; practical vocational instruction, 1,090; practical instruction in special subjects (technological and pre-diploma practice), 340; industrial work in special subjects, 1,930.

In the case of students in specialized educational institutions who are admitted to the 3-year or 3½-year course after completing the full secondary school course, the curriculum does not include general education subjects.

The courses at specialized secondary schools give students, in addition to general knowledge of secondary school standard, the necessary theoretical and practical training for the special fields of work they have chosen; in specialized technical and agricultural secondary schools students also obtain a qualification, with the award of a grade, in one of the trades covered.

Teacher training schools

The total number of specialized secondary schools includes 37 teacher training schools which are under the authority of the Ministry of Education. Most of these have departments which train teachers for grades 1–4 in the 8-year schools; in other teacher training schools there are departments which train kindergarten teachers, teachers of handwork for grades 5–8 in the 8-year school, music teachers for kindergartens, singing teachers for grades 5–10 in secondary schools, and physical education teachers for grades 5–8 in the general 8-year schools.

The courses last 2 years, except those for singing, handwork and music teachers, which last 2 years and 10 months.

For admission to any section of a teacher training school, students must have completed the general secondary school course. Admission is competitive, depending on the marks gained in the entrance examinations. Where marks are equal, preference is given to students who have done a period of industrial work.

The curricula are approved by the Ministry of Higher and Specialized Secondary Education of the Ukrainian S.S.R. and provide for not more than 36 hours' work a week in any of the sections. On the basis of these curricula, a permanent time-table is drawn up for each semester, allowing for a uniform work-load for students each day of the week. In this time-table, the first periods are devoted to the more difficult subjects, calling for intellectual effort (languages, mathematics, psychology, education, etc.), and the later periods to the easier subjects, or those which require more physical work (drawing, singing, handwork, work in the school experimental plot, elocution, etc.).

Annual winter and spring examination sessions are held, when the students take examinations covering the whole syllabus in two, three or four subjects (the number of examinations varies in the different sections). When the whole curriculum has been completed, state examinations are held in two, three or four of the special subjects.

Students who complete the course and pass the state examinations are guaranteed work in their special field of teaching.

Correspondence and evening schools

For those citizens of the Republic who are employed in industry, agriculture, administration and various forms of cultural work, there is a whole system of correspondence and evening courses which they can take while continuing their employment. This type of education is available to all citizens of the Ukrainian S.S.R. who have reached the required educational standard (the 8-year general school course or the full secondary school course).

To provide favourable conditions for the education of workers engaged in industry, the Government of the Ukrainian S.S.R. has instituted a number of privileges, such as additional leave with pay (contributed by the factory): (a) for the period when laboratory work is being carried out, or the examination period for first and second year students in specialized secondary evening schools—10 calendar days, and for correspondence course students—30 calendar days; (b) for students in the third and later years at specialized secondary evening schools—20 calendar days; and for correspondence course students—40 calendar days; (c) for the period of the state examinations for specialized evening and correspondence schools—30 calendar days; (d) for the period when students at specialized evening and correspondence schools are preparing and defending their diploma projects—2 months.

It is laid down that, for a period of 10 academic months before the beginning of the diploma project or before the state examinations, students at specialized evening and correspondence schools shall have one day a week free from their work for preparation; they are then paid 50 per cent of their normal wage.

Students at specialized secondary correspondence schools receive 50 per cent of the cost of their return journey to the school to carry out laboratory work, to sit for tests and examinations once a year, and also to prepare and defend their diploma project or to sit for the state examinations; the money is contributed by the factories or institutions where they work.

On the recommendation of the educational institutions concerned, the directors of the factories and institutions where students work may grant students in the final years of courses at specialized evening or correspondence schools a further month's leave of absence to enable them to gain direct industrial experience of work in the special field they have chosen, and to prepare suitable material for their diploma projects. During the period of leave referred to, students are paid on the usual basis.

In places where there are large numbers of students, tutorial centres are set up, and branches of specialized secondary educational institutions are opened, where tutorials are held and laboratory and practical work performed.

Instruction for shift workers is organized so that those who are on the second shift can attend 'evening school' courses in the morning. Students in the correspondence evening (shift) and day school sections may transfer at will to any other of these types of instruction, as the curricula and programmes are the same for all three types of courses. The correspondence course and the courses in evening (shift) schools are both one year longer than the day course.

Out-of-class activities

In order to develop independence and initiative, general secondary school pupils are encouraged to take part in the management of the school's corporate life. In every school, a pupils' committee is elected from among the pupils, which, together with the Young Communist League organizations, helps the school authorities and the teachers to inculcate in the pupils a conscientious attitude toward their responsibilities, to improve school discipline, to develop the pupils' social initiative and independence, to inculcate good social habits and to unite all the pupils in a comradely group with a sense of duty and a feeling for the honour of their school.

The pupils' committee assists the teachers in carrying out measures designed to improve the quality of the pupils' knowledge and progress, plays a leading part in the pupils' self-government in the classroom, co-operates with the Young Communist League in producing the schools' wall newspaper, helps in carrying out social and political work and in arranging cultural, physical culture and sports activities for the people, and encourages the pupils to undertake socially useful work.

A considerable amount of out-of-school work is regularly carried on by secondary schools in the Ukrainian S.S.R. The children's interests and desires are taken into account, and the work is designed to inculcate in the pupils a love of knowledge and work and respect for working people, to foster in them a materialist and humanist outlook, and to develop independence in all types of activity—technology, art, nature study, physical culture, sport and tourism. Special attention is paid to the development of technical inventiveness, both in the schools and in other institutions, to the invention by the pupils of new tools, patterns and technical mechanisms, and to the promotion of proficiency in agricultural work.

Every general secondary school in the Ukraine has its physical culture group, to which the majority of the pupils belong. The pupils take part in various branches of sport—field and track athletics, swimming, basketball, volleyball, skiing, etc. The pupils themselves play an active part in organizing the school's leisure-time sporting activities. Apart from the sports activities carried on in the ordinary schools, the pupils' attendance at sports schools also contributes to their physical development and their sporting prowess. There are 114 schools of this type in the Ukrainian S.S.R.

Republic-wide *Spartakiads* (sports contests) for schools are held annually in the Ukraine. Fifteen different branches of sport are represented in the programme. As a preliminary to these contests, district, city and regional competitions for schools are held in the country districts and the towns. In 1958–59 alone, over 3 million pupils attending general schools took part.

All out-of-school work with schoolchildren is conducted under the guidance of the Ministry of Education of the Ukrainian S.S.R. and various bodies under its jurisdiction, e.g., the Republican Centre for Young Naturalists, the Republic Centre for Young Technicians, the Republican Centre for Young Tourists, the Republican Centre for Art Education, numerous regional centres for young naturalists, tourists and technicians, Pioneers' Palaces and clubs, and other out-of-school institutions.

TRENDS AND PROBLEMS

The present system of public education in the Ukrainian S.S.R. is truly democratic, and meets the needs of Soviet society, which has entered on a period of large-scale building-up of Communism; it ensures that the general secondary school plays an active part in all the creative activities of the Soviet people, and that the people receive an all-round education, equipping them with a sound knowledge of the principles of science and at the same time preparing them for systematic physical work and for taking part in the production of those material goods which are needed by society.

STATISTICS[1]

Population (census 15 January 1959): 41,869,000.
Area: 222,625 square miles; 576,600 square kilometres.
Population density: 188 per square mile; 73 per square kilometre.

1. Educational statistics included with those of the U.S.S.R.

THE EDUCATIONAL SYSTEM

In 1910 the four self-governing colonies of the Cape Province, Natal, the Orange River Colony and the Transvaal, each with its own system of education (the result, in the main, of Dutch, English and Scottish ideas) came together to form the Union of South Africa, the boundaries of the old colonies becoming the boundaries of the new provinces.

Section 59 of the Act of Union states that the Union Parliament has full power to make laws for the peace, order and good government of the whole country and that, in establishing provincial councils, the legislative power of the Central Government is in no way diminished. Whilst certain definite powers and functions are allocated to the provinces, it is none the less possible for the Union Government to abolish provincial government altogether.

Under Section 85 of the Act, the control of education is divided, the Central Government taking over 'higher education' and the provincial governments 'education other than higher', that is, primary and secondary education. Developments in vocational and special education and also in the field of native education have made the dividing line between 'higher education' and 'other than higher' difficult to define. By a succession of parliamentary Acts, the Union Government has gradually assumed control of certain types of education which it considers should be handled on a national basis, both because of the nature of the education to be provided and its expense. Thus, industrial education, agricultural education, special education, vocational and technical education and Bantu education have been declared to fall under 'higher education' and therefore under the control of the Central Government.

'Higher education' was intended to be education at university level, but the anomalous position now obtains that it covers all forms of education from nursery school to post-doctoral study. A further anomaly is that the training of primary and, to a limited extent, secondary teachers at post-secondary level is carried on by the provincial governments.

Factors affecting the provision of education

South Africa is a country of many races, with separate schools for the children of European, Bantu, Asiatic and Coloured parents.

The population figures are: Union, 14.1 million: European 2.96 million, Bantu 9.46 million, Asiatic 0.4 million and Coloured 1.3 million. Ethnic groupings, expressed as percentages, are (1951): European 20.9, Bantu 67.6, Asiatic 2.9 and Coloured 8.7. The Commission for the Socio-Economic Development of the Bantu Areas within the Union of South Africa (1955) stated that the trend was towards a European population of approximately 14.7 per cent of the total, Bantu 68 per cent, Asiatic 4.4 per cent and Coloured 12.5 per cent. From an educational standpoint, therefore, increased numbers and proportions of non-European peoples must be educated. In addition, in the foreseeable future stage of their development the non-European groups will have, as they have at present, a much higher proportion of children of school-age than the Europeans, who are, so to speak, an older population.

The discovery of gold, diamonds and many other minerals has brought about very considerable development in South Africa. It is in the field of secondary industry, however, that the most significant developments are taking place. In 30 years the gross output has been multiplied by 17, and the scope for employment for both Europeans and non-Europeans has expanded greatly.

As a result of these developments, urbanization has gone on apace, as is shown in the following table.

URBAN DISTRIBUTION OF POPULATION (UNION)
(in percentages)

Year	European	Bantu	Asiatic	Coloured
1911	51.6	12.7	unknown	unknown
1936	65.2	17.3	66.3	53.9
1951	78.4	27.2	77.5	64.7

These figures show the pronounced drift to the towns on the part of all sections of the population. Approximately two-thirds of the Bantu (mainly agriculturists) live in reserves or on farms occupied by Europeans. Secondary industry, however, in the urban areas, employed over 300,000 Bantu workers in 1952, almost three-fifths of the total labour force in this sector. The majority is engaged in manual, unskilled work, but steady expansion and mechanization are providing increased opportunities for semi-skilled and even skilled work.

The composition of the labour force in South Africa is changing rapidly. The proportion of Europeans in certain industries like clothing and textiles, furniture, food, and leather has fallen considerably and the proportion of Bantu and Coloured workers has risen. This applies also to Bantu women, large numbers of whom have entered industrial employment in recent years.

The influx of large numbers of Bantu into the towns has resulted in a permanently-established urban population, but a large proportion of the workers are migrant labour. The absence of Bantu males from the reserves for long periods has had a serious effect on the stability of the rural, peasant, patriarchal and tribal social structure. In turn, the nomadic labour force of the cities is seriously affected by the environment in which it lives and by the absence of the tribal and family discipline. Problems of satisfactory

remuneration, housing, education, recreation and general control have to be solved. It is clear that here education has a major role to play.

Language. The European population comprises two main groups, English- and Afrikaans-speaking. Those whose home language is Afrikaans represent about 57.6 per cent of the total European population, English about 40.1 per cent, and others 2.3 per cent.

The Act of Union (1910) laid down that English and Dutch (later to become Afrikaans) are the official languages of the country. In all government schools the second language is compulsory, bilingualism having become one of the aims of education in South Africa.

The principle of mother-tongue instruction has been accepted, with the result that two types of school have developed: single medium schools (the second official language being taught as a subject) and parallel medium (in effect, two single medium schools under one roof and one principal). An idea of the proportion of children being taught in Afrikaans or English may be obtained from the following table.

MEDIUM OF INSTRUCTION OF EUROPEAN PUPILS (1958)

	Only English	Only Afrikaans	Both
Primary . . .	32.9%	65.3%	1.8%
Secondary . . .	34.8%	62.4%	2.8%

The manner of regulating the question of which language is to be regarded as the home-language of the child may vary from one province to another. In the Cape Province, Orange Free State and Transvaal, the home language is defined as that which is 'better known and understood by the pupil'. It is the school principal's function to decide this matter; where there is doubt (i.e. where the child is equally good in both languages) then the parent can choose the medium of instruction. In Natal, the 1942 Education Ordinance establishes that: 'The medium of instruction of every pupil in every government school for Europeans shall . . . be that official language selected by the parents.'

Responsibility for education

Responsibility for education rests with the central government, the four provincial governments and with private agencies.

The Union Government. Certain education functions are discharged by the Union Government through various State Departments, each under a Minister of State, e.g. (a) the Department of Education, Arts and Science; (b) the Department of Social Welfare, which is responsible for child welfare and a number of related institutions; (c) the Department of Agriculture, which is responsible for agricultural colleges and faculties, extension service and forestry schools; (d) the Department of Mines, which is responsible for miners' schools; (e) the Department of Defence, which is responsible for school cadets; (f) the Department of Bantu Administration and Development, which is responsible for Bantu education. Of these, (a) and (f) are the more important departments and will be described more fully.

The Department of Education, Arts and Science is under a Minister of Education and a Secretary for Education. It is responsible for the universities; although these are autonomous institutions, they derive two-thirds of their revenue from government sources. A Committee of University Principals acts in an advisory capacity to the Minister of Education. Admission to the universities is a Matriculation Exemption pass in the examination controlled and conducted by the Joint Matriculation Board, a body consisting of representatives of each university, the provincial, Union, South-West African and Southern Rhodesian Education Departments, and of teachers in public and private secondary schools.

The Union Department also has responsibility for special schools (administered under the terms of the Special Schools Act No. 17 of 1937); 'schools of industries' for children in need of care, and reformatory schools (both administered under the Children's Act No. 17 of 1937); and vocational schools, mainly at the secondary level administered under the Vocational Education Act No. 70 of 1955).

The Union Department of Bantu Administration and Development includes a Division of Bantu Education with a head who is the State Secretary in charge of Bantu Education. Under the Secretary is an Under-Secretary for administration and a Deputy-Director on the professional side. There are six regions (Northern Transvaal, Southern Transvaal, Transkei, Ciskei, Orange Free State and Natal) each under a Regional Director who has inspectors (European) and sub-inspectors (Bantu) to assist him.

Native education, as it was then called, started about 150 years ago, through the enthusiasm and vigour of the churches. Up to 1850 the missions bore the full burden of the cost. During the period 1850–1925 the State began to intervene by making grants to Bantu schools, which were then almost entirely denominational. Gradually, through supervision of curricula, inspection and the training of teachers, the provinces began to exercise greater control. Native communities, too, began to take more interest in the schools. From 1926 onwards the provinces exercised still more control over subsidized schools though the funds came from the Central Government and not from the provincial coffers. There were many difficulties of co-ordination. The number of aided mission schools, however, grew rapidly from some 2,700 in 1926 to nearly 4,400 in 1945. In the latter year there were only 230 government schools.

In 1951 a government Commission on Native Education stated that native education was not an integral part of the life of the Bantu; that it had no organic unity but was split into a bewildering number of different agencies, none of which was planned properly as part of a whole; that it was conducted without the active participation of the Bantu as a people, either locally or on a wider basis; that it was financed in such a way that it achieved a minimum of educational effect on the Bantu community and made planning virtually impossible. The commission's recommendations became the blueprint for the Bantu Education Act (No. 47 of 1953) which transformed the entire pattern

of native education. The main points of the Act were:

1. The education of the Bantu was to be removed from provincial control and transferred to the Union Government as part of a Division of Bantu Affairs, which would integrate a uniform educational policy with the development of the Bantu community as a whole. It should be noted that the education of the Bantu was to be a separate entity from that of the rest of multi-racial South Africa; control was not to be exercised by the state educational organization, the Union Education Department, but by the state department controlling native affairs. There was to be centralized control but decentralized administration in six regions.
2. Local control of schools, under the supervision of the State, was to be entrusted to Bantu organizations, which would learn to render service to their own communities. The mission school was to be replaced by the community school. Churches would have the option of retaining control of their existing schools as private institutions with a subsidy reduced to 25 per cent of the salaries and allowances payable to approved teachers for a limited period, or to relinquish control of these schools to Bantu community organizations. (As a result of this option, some 5,800 mission schools had been transferred to the State by 1958.)

   Under the new arrangements five types of Bantu schools are recognized: private unaided schools, state-aided mission schools, state-aided farm schools, state-aided community schools, and government Bantu schools. Since 31 March 1955 all Bantu schools, other than government Bantu schools, have had to be registered.

   School boards and school committees composed of Bantu, nominated partly by the officials of the Department and (outside urban areas) partly by the chief or headman, have been set up.
3. The Central State Department was to take over all teacher training institutions.
4. The commission recommended that the responsibility for financing Bantu education be shared by the State and the Bantu community, with the latter gradually assuming more of the burden.

The Government, however, pegged the amount to be set aside from general revenue for Bantu education, the rest of the funds to be provided by an allocation from the Native General Tax. Expansion, therefore, means increased taxation for the Bantu community.

Under these provisions, a word may be added on some organizational aspects of Bantu schooling. The prevailing types of institution are lower primary schools (with a 4-year course), higher primary schools (the subsequent 4-year course), combined primary schools (which are the most common type), secondary schools (with courses of 4 and 5 years), combined primary and secondary schools, and industrial schools. The distribution in classes of Bantu children is interesting. In 1955, of the 1,005,774 children attending school, 466,527 were in the first two years, and over 70 per cent of the total were in the first four years. Over 90 per cent of those attending school were in the primary classes, and only 1,000 children were in the last two years of the secondary school. The secondary school figures will improve fairly rapidly, however. The statistics indicate that there are two main problems: to secure the enrolment of more children (over 50 per cent of the school age population is enrolled at present), and to improve the holding power of the school.

The importance of mother-tongue instruction has been recognized, especially in the lower primary school. Bantu schools provide for the use of the four main Bantu language groups. The two official languages of the country are introduced in the first two grades.

Provincial governments. They control primary and academic secondary education for European, Asiatic and Coloured children. Each province has an elected Provincial Council under an Administrator and an Executive Committee. The direction and control of education is vested in the Administrator. Under him there is a Department of Education, the head of which is styled a Superintendent-General in the Cape Province and Director of Education in the other provinces. This official, who is a professional teacher, is supported by a Deputy-Director of Education, a Chief Inspector of Education, and a team of inspectors who act as field officers. The administrative staff are provincial administrative officials—not teachers.

Each province conducts education according to the terms of Education Ordinances passed by the Provincial Council and approved by the Governor-General. The Director of Education in the Transvaal is required under the Education Ordinance of 1953 'to promote education in this Province and the progressive development of institutions devoted to the purpose and through his guidance and control to carry out the provincial educational policy'.

The Cape Province, the Orange Free State and the Transvaal have a system of school boards composed of lay personnel, who are not paid, and a salaried secretary. There are 20 such boards in the Transvaal, the largest having over 150 schools with over 70,000 children and the smallest some 20 schools. Two-thirds of the members of a board are elected by the parents of school-going children in provincial schools, the other third being nominated by the Administrator. In the Cape, there are over 100 school boards composed in much the same way as the Transvaal boards but elected by the registered voters of the districts involved. In the Orange Free State boards are elected from school committees. In general, these boards exercise supervision over provincial institutions, including Coloured and Indian schools. They receive money for the maintenance of school buildings, furniture and so on, enforce compulsory school attendance, and have an important say in the appointment and promotion of teachers. They have no taxing powers, unlike such bodies in a number of other countries, and no responsibility for financing education.

In the Cape Province, Orange Free State and Transvaal, school committees are an important part of the educational system. They are statutory bodies elected by the parents of each state school, their functions being broadly as follows: (a) to exercise general supervision over a school, provided that the scope and manner of such supervision may be defined by the head of the Department of Education; (b) to advise the school board in matters affecting the welfare of the school; (c) to deal with the representations of the parents. In conjunction with the school boards these committees select teachers, subject to the approval of the Department which makes the final appointments.

In these three provinces, therefore, in spite of centralized control by the Department of Education, the rights of parents to participate in the control of education are recognized and put into practice. In Natal, however, there are no local authorities for education. All matters educational are controlled directly by the Department of Education at the provincial capital. However, where such are desired, provision is made for school advisory committees with purely advisory functions. In all four provinces parent-teacher associations, which have no statutory powers, are rapidly becoming important factors in education.

The provinces are responsible for the financing of primary and secondary education from revenue obtained from Union subsidies and provincial taxation. The Financial Relations Consolidation and Amendment Act (No. 38 of 1945) lays down the principles and procedure. Each year an amount is paid from the Consolidated Revenue Fund of the Union to each province equal to 50 per cent of the net expenditure for that year, subject however to certain limitations. In the Cape Province, primary and secondary education for Europeans and non-Europeans, except for a few schools for Europeans, is free in all classes up to and including standard 10 or until the pupil attains the age of 19 years.

In Natal, primary education is free in schools for Europeans, Coloureds and Indians and in Indian government-aided primary schools. Two government primary schools for European boys charge fees. Books and school requisites are provided free for Europeans and Coloureds in government and in certain aided schools. In primary government schools for Indians books are provided free for indigent pupils. Except in a few European schools, no fees are payable in government secondary schools for Europeans, Coloureds and Indians. In the Transvaal all provincial education, even above the upper limit of compulsory education, is free and all school equipment is provided by the Administration—much of it, however, on a pound for pound basis. In the Orange Free State all provincial education up to and including standard 10 is free but certain approved schools are allowed to charge tuition fees.

There is no Union legislation in regard to compulsory education, which is a provincial responsibility and therefore varies. In all four provinces the onus is on parents to see that their children attend a state or registered private school, unless exemption is obtained. The statutory age for starting compulsory schooling is 7, but the general practice is to accept children in the year in which they turn 6, with the result that the majority of South African children go to school when they are 5 years of age. This affects the number of years they spend at school and also the age at which they complete the secondary school course; the latter is lower than it was a decade ago. In most parts of South Africa compulsory education legislation requires school attendance up to a certain minimum age but exempts pupils who are below that age if they have passed a specified class or grade. There is, however, a trend in favour of requiring all children to stay at school until they reach the prescribed leaving age.

The Cape Province permits a pupil whose sixteenth birthday falls in the first half of the year to leave on the attainment of the birthday; if the birthday falls in the second half of the year, then the pupil must attend until the end of the year. However, a pupil who has passed standard 8 (i.e. 10 years of school for a normal child) may leave school.

The Orange Free State requires that the age of 16 must be reached irrespective of scholastic attainment. In Natal, pupils must reach the age of 15 years or pass standard 8. Since the beginning of 1957, Transvaal pupils must remain at school until the end of the year in which they turn 16.

Compulsory school attendance applies only to European children in the Transvaal and the Orange Free State. In Natal, the law applies to European and Coloured children but not to Indians; in the Cape Province, it applies to European children, but the Coloured Education Ordinance, 1945, provides that where sufficient and suitable school accommodation exists the Administrator may order compulsory attendance for Coloured children of 7–14 years of age.

Private agencies. There are two types of school which fall outside the financial system of education: (a) the private school which is financially independent, and (b) the aided school, i.e., a private school which has applied for and obtained financial assistance from the provincial administration.

South African parents support the provincial systems of education, over 94 per cent of children attending such schools. A number, however, mostly English-speaking, prefer the English tradition of the single-sex boarding school, usually denominational. The number of children attending such schools has increased over the years, as the figures in the following table show.

NUMBER OF CHILDREN ATTENDING PRIVATE OR SEMI-PRIVATE SCHOOLS

Year	Aided schools	Independent schools	Total
1946	12,134	36,022	48,156
1955	20,932 (130 schools)	43,823 (261 schools)	64,755

Of the independent schools, 111 were undenominational, 117 Roman Catholic, 15 Anglican, 2 Methodist and 2 Presbyterian; there were no Dutch Reformed Church schools. The figures for aided schools follow much the same pattern. Natal has the highest proportion of such schools, with the Cape Province close behind. In all the provinces private schools must be registered as schools approved by the Director of Education. Conditions vary, but in general there is a measure of control through inspection and approval of the curriculum.

Where aid is granted, it is usually in the form of payment of a proportion of the salaries of qualified staff. Provision is made in the Orange Free State and Natal Ordinances for the payment of a subsidy to private schools. The Transvaal subsidizes only those established before 1953, and the Cape Province does not assist denominational schools apart from a limited number of church primary schools for Europeans and mission schools for Coloured children.

In organization and curriculum private schools do not differ greatly from state schools. As a rule they take the same public examinations.

Under the Bantu Education Act (No. 47 of 1953), all private schools for Bantu must be registered and may be inspected. There has been a great decrease in the number of such schools since 1953.

Structure of the school system

This may be seen in the diagram on page 1117, which reflects a generalized pattern for the Union as a whole. The primary and secondary schools are a provincial responsibility, and administrative aspects have been treated above. Some further remarks on organization in general may usefully be given here. The provision of separate schools for Coloured and Indian children within the provincial framework will also require explanatory notes.

The provincial school pattern is 7–3–2; a 7-year primary course organized as two grades and five standards, a junior secondary stage (standards 6 to 8), and a senior secondary stage (standards 9 and 10); however some 8-year primary schools still exist. As a rule, primary and secondary classes are in separate institutions with a clear-cut division at the end of standard 5. The all-range schools, taking children from the infant grades to standard 10, are a diminishing group.

Co-education is the practice at primary school level. In general, Afrikaans-medium high schools are co-educational and a large proportion of English-medium likewise. Further classification of schools, in terms of the medium of instruction, also occurs.

Coloured education. Nearly 90 per cent of the Coloured population are to be found in the Cape Province. They have no language of their own, using the official language most common in the area where they live; thus in the Cape and the Orange Free State over 90 per cent use Afrikaans, and in Natal over 60 per cent use English.

In the northern provinces, practically all Coloured schools are state schools which are treated as ordinary government schools under provincial control. In the Cape Province, a separate branch of the Departmental Headquarters deals with Coloured education; over 1,000 mission schools, falling under the management of church bodies, are substantially aided by the province, the remaining 20 per cent of the children attending undenominational schools. The Cape policy is not to subsidize secondary schools.

Indian education. Over 80 per cent of the Union's estimated Asian population of 431,000 (1957) is concentrated in Natal where the Indian population now outnumbers the European population.

A rapidly-increasing and youthful population is changing from agricultural labouring class to town-dwellers. The demand for education is increasing every year, and enrolments have risen from 8,500 in 1925 to 80,000 in 1955. The great majority of schools are of the government-aided type, the Indian community and the Natal Provincial Administration each contributing equally towards new school buildings. However, Indian education is becoming a provincial responsibility to a far greater extent than in the past, and all Indian teachers are now employees of the provincial administration.

In spite of the fact that there is as yet no compulsory education for Indian children in the Transvaal or in Natal, the average attendance of those attending school is over 90 per cent. The Provincial Education Committee (1946) recommended that Indian children should be permitted to attend school, if accommodation were available, at the beginning of the year in which they turn 6 and that once they are admitted they should be compelled to attend until they had passed standard 4 or until their 13th birthday. This recommendation was not carried into effect because

GLOSSARY

NOTE. Except for pre-primary schools promotion is by internal examination up to the senior certificate or matriculation examination at end of secondary course. In Natal there is also a public examination at end of third year of secondary school.

agricultural college: vocational training school of agriculture with courses at upper secondary and post-secondary level.

junior secondary school: lower general secondary school providing terminal course for pupils who do not wish to continue studies beyond compulsory school age.

military college: post-secondary vocational school preparing for careers in the armed services.

military gymnasium: vocational school preparing for careers in the armed services with one-year courses at upper secondary and post-secondary level.

nursing college: specialized vocational training school at upper secondary level.

nursing college: specialized vocational training school at upper secondary level.

nursery school: private (sometimes subsidized) pre-primary school.

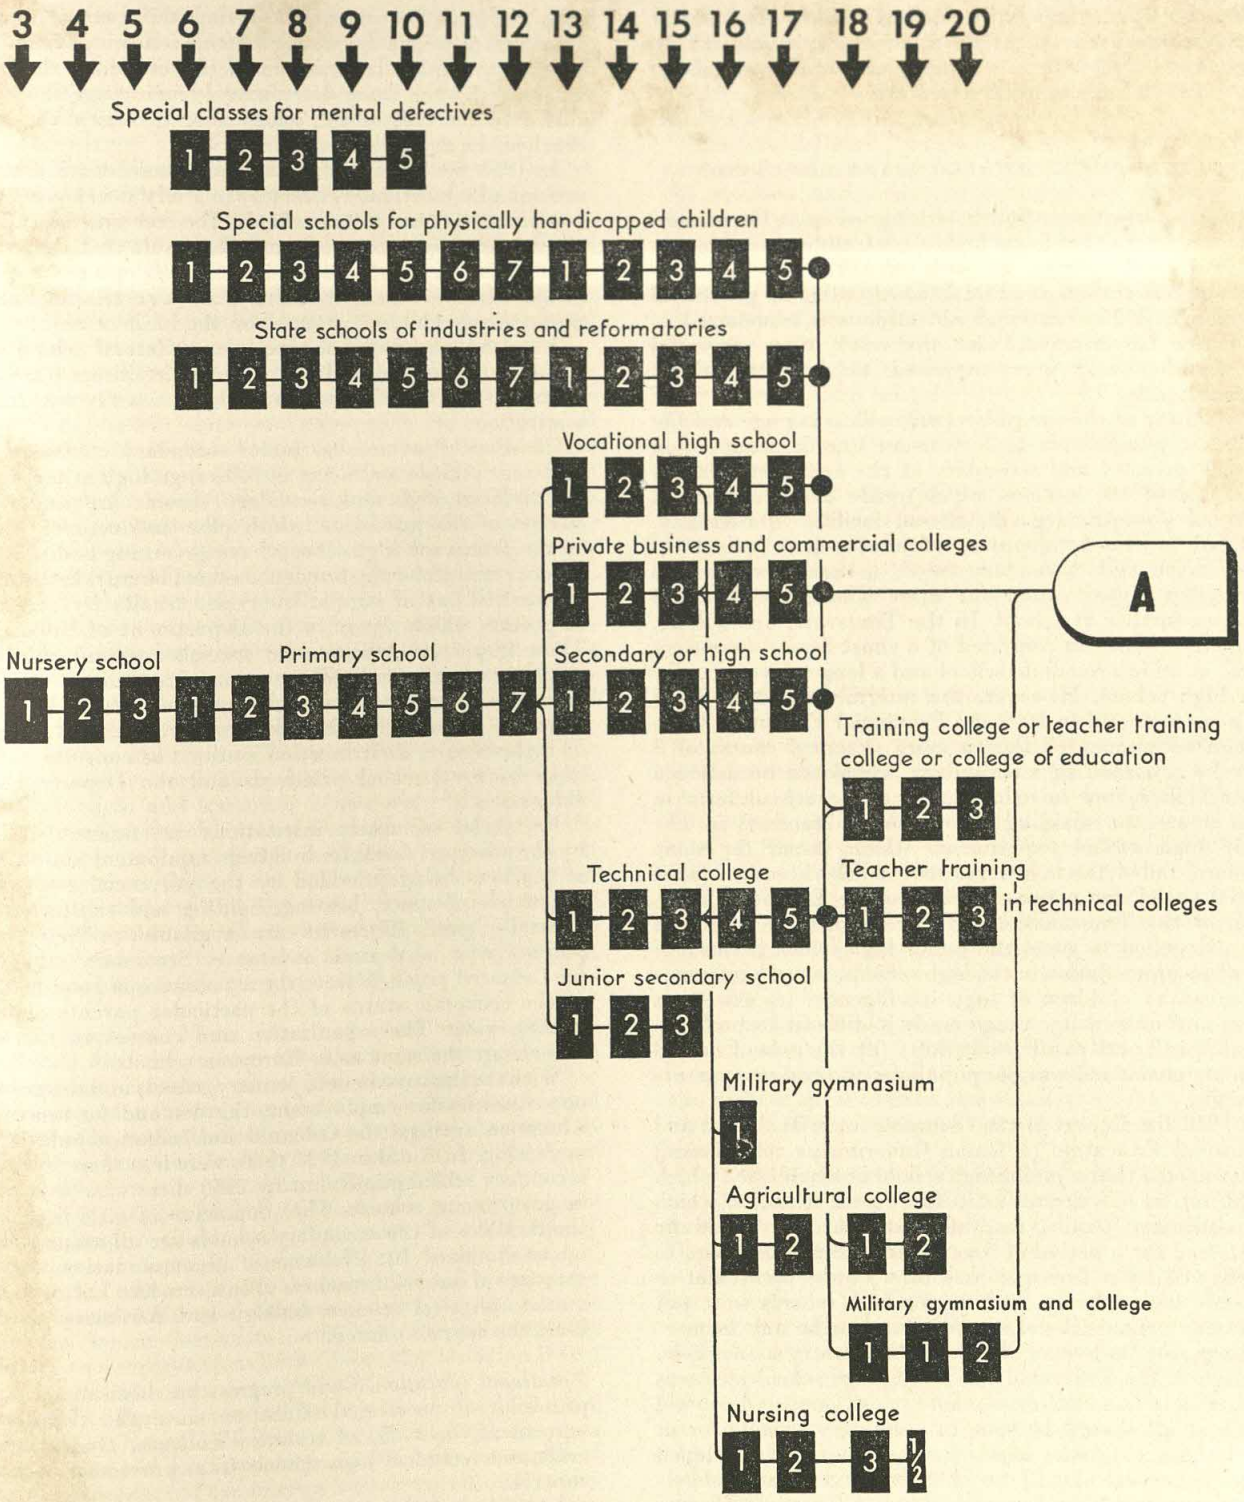
private business and commercial colleges: vocational secondary schools of commerce.

secondary or high school: general secondary school.

special schools for physically handicapped children: State residential schools providing primary and secondary education of both general and vocational nature for blind, deaf, crippled children, etc.

State schools of industries and reformatories: schools for delinquents, vagrants or destitute children.

teacher training college or training college or college of education: teacher training college with courses at two levels, post-secondary and postgraduate.



teacher training in technical colleges: teacher courses conducted at the technical colleges, and preparing teachers of vocational subjects, physical education and nursery education.

technical college: multilateral vocational secondary school with day classes and also evening courses for apprentices, sometimes going beyond the secondary level.

vocational high school: vocational secondary school with separate institutions for technical training, home economics and commercial courses.

of shortage of accommodation and of teachers, but steady improvements are seen in this direction. It should not be long before it will become possible to introduce compulsory education for Indian children in Natal.

THE DEVELOPMENT OF SECONDARY EDUCATION

Secondary education in South Africa grew up on the pattern of the traditional academic high school. Differentiation was however being sought as early as 1910 and separate technical institutions were established, all under provincial control. By 1925 vocational education was transferred to the Union Government, with the result that provincial secondary schools were supposed to provide general education only.

The raising of the compulsory school-leaving age and the gradual crystallization of a clear-cut line of demarcation between primary and secondary at the end of standard 5 were two of the reasons which made the provision of increased post-primary educational facilities a necessity. This led to the development of intermediate schools in urban areas and 'secondary tops' in rural areas, which provided a 3-year course for those who did not intend to go on further at school. In the Transvaal, up to 1937, secondary education consisted of a short 3-year secondary course at an intermediate school and a longer 5-year course at a high school. However, the intermediate school was not a success, and in 1939 the Provincial Education Commission recommended that a more practical course of 3 years be provided in a secondary school—to be called a junior high school in urban areas and a school farm in rural areas—the dividing line to be at standard 5. The junior high school experiment, which lasted for some 15 years, failed for many reasons; chiefly because: (a) it created social distinctions foreign to the European population of the Transvaal; (b) duller children in the cities were compelled to go to the junior high school because of lack of accommodation in the high schools, where preference was given to children of high intelligence; (c) the short course and narrow age range made it difficult to build up school spirit and pupil leadership; (d) the school lacked adequate goals, and was not popular with teachers, parents or pupils.

In 1948 the Report of the Commission on Technical and Vocational Education (a Union Government commission) recommended that a junior high school be established which would not be a separate institution but a school to which all ex-primary pupils, i.e., after standard 5, would be transferred for a period of 3 years of general education, to be followed by a 2-year course in separate vocational or academic high schools. Such junior high schools were not to provide organized vocational education in any form.

This report had some effect on the country as a whole, although in the Transvaal the junior high school idea was rejected as it was considered that: (a) all pupils who could benefit at all should be sent to secondary schools for at least 3 years; (b) junior high schools as they had developed in the Transvaal should be abolished, secondary schools making provision for 5-year courses; (c) more than one course should be offered wherever possible; (d) standard 5 should be the highest class in a primary school, and pupils who reached the age of 13 during the year should be transferred at the beginning of the following year to a secondary school, irrespective of the standard they had attained; (e) the compulsory school leaving age should be raised to the end of the school year in which the pupil reached the age of 16.

In 1955 the Transvaal Provincial Administration sent a mission of educationists overseas to study developments in comprehensive secondary schools. The recommendations of the mission were accepted, with the result that since 1958 the Transvaal has been engaged in developing a type of comprehensive school enrolling a cross-section of normal post-primary children grouped on the basis of ability.

Natal has developed a type of multilateral school with a number of courses leading to Junior Certificate (standard 8) and Senior Certificate (standard 10), usually within one institution.

The Cape Province has junior secondary courses, some in 3-year schools and some in full-range high schools.

Provincial high and secondary schools are under the control of the provinces, which plan and control policy. In the Transvaal, high schools have governing bodies which do not come under the provincial school boards. Inspections are carried out at regular intervals, usually by panels of inspectors which report to the Department of Education. These inspectors, who are not specialist secondary school inspectors but inspect all provincial institutions within a circuit or area, are usually graduates who have had considerable experience as teachers and principals of primary or high schools; their function is to act as consultants and links between school principals and the Department of Education.

Provincial secondary institutions are financed wholly by the province, funds for buildings, equipment and salaries of teachers being provided by the provincial exchequer. Standards of space, heating, lighting and sanitation are generally good. Bursaries are available to help those parents who need such assistance. Secondary education for Coloured pupils is free; the attendance is good because of the economic status of the particular parents and the goal in view. The organization and courses in Coloured schools are the same as in European schools.

With the improvement in primary schools and the growing opportunities for employment, the demand for secondary education amongst the Coloured and Indian populations is increasing. In Natal in 1924 there were less than 50 Indian secondary school pupils, but by 1956 there were over 3,500 in government schools. The proportion of girls is, as yet, small. Many of the secondary schools are all-range schools up to standard 10; problems of accommodation and the shortage of qualified teachers of subjects like Latin, mathematics, physical science, biology and Afrikaans tend to limit the courses offered.

Vocational education. Good progress has been made in the provision of vocational education since the transfer by agreement, in 1925, of technical colleges, trades, housecraft and technical high schools from provincial to Union control.

In 1954, the Cabinet re-affirmed that vocational education 'was and would remain a function of the Central Government'. As a result of the passing of the Vocational Edu-

cation Act in 1955 the technical colleges are in process of being taken over completely by the Union Education Department, the re-organization to be completed by 1960. This will make the technical colleges free instead of fee-paying institutions, bringing vocational education of a secondary type into line with provincial secondary education. The main courses of a secondary nature are technical, commercial and domestic science. Part-time study, however, accounts for over 85 per cent of enrolments.

Under the new organization, vocational schools will fall directly under the control of the Union Department of Education, Arts and Science in regard to buildings, salaries, equipment, etc. Inspection is carried out by departmental inspectors. Bursaries are available to help parents.

The Apprenticeship Act (1944) regulated the training and employment of apprentices, apprenticeship committees being established which are responsible for the detailed administration of the Act in local areas. Conditions of apprenticeship are as follows: (a) Minors under the age of 15 may not be employed; the educational qualification is usually a minimum of standard 6; (b) Apprenticeship may last from 3 to 5 years, dependent upon remissions for educational qualifications and pre-apprenticeship training, e.g., in a trades school. (c) Where facilities are available, all apprentices must attend technical classes during the first two years of apprenticeship on one day a week during ordinary working hours, or alternatively must follow correspondence classes. The apprentice courses are offered in technical colleges and technical high schools.

In 1946 the M.L. Sultan Technical College in Durban was declared a place for higher education; since then, progress has been rapid and a number of part-time branches have been opened in the environs of Durban. The college admits Indian, Coloured and Bantu students, over 90 per cent being part-time. Courses are offered in general education, commercial subjects and secretarial work, homecrafts and catering. In addition, the technical high school provides full-time training in motor mechanics, woodworking, cabinet-making, bricklaying and radio.

Bantu education. Much secondary work was originally combined with the primary school; the present policy is to separate the secondary school from the primary, the latter ending at and including standard 6. So far there is a limited number of high schools leading to standard 10, most schools being secondary and leading to the new Junior Certificate course, which is a 3-year course after standard 6.

The first year (or form I) of the course is a preparatory year leading to junior secondary work, which virtually commences in form II, and the Bantu Lower Teachers' Course. This course is under the control of and is examined by the Bantu Education Department. Pupils who wish to take the Senior Certificate (standard 10) must however conform to the regulations of the Joint Matriculation Board if matriculation exemption is desired.

Control of Bantu secondary schools is exercised from the Secretary of Bantu Education through regional directors to inspectors and sub-inspectors and thence to principals of schools. A number of committees have been set up in order to assist the functioning of the Department: the Secondary Examinations Committee, whose duties are to frame syllabuses for the Junior and Senior Certificate examinations, to prescribe books and to control the examinations (eight sub-committees carry out the work of framing and revising syllabuses); Bantu Languages Committees (five in number); a Central Book Committee, which advises the Department in regard to the selection and approval of books.

The School Board, in collaboration with the committees concerned and with the Department, plans and promotes the erection and maintenance of school buildings, the fencing of school premises and the provision of water. It also employs, transfers and dismisses teachers subject to the approval of the Department, collects and controls the spending of voluntary and other contributions as well as all moneys allocated by the Department. The Department prescribes the conditions of appointment and service, including the rights, duties and privileges of teachers in the government Bantu schools; prescribes the code of discipline for teachers and the courses of training or instruction in government Bantu schools and the fees, if any, payable for such courses.

As yet, vocational education amongst the Bantu is very limited. A few schools provide 4-year courses (post-standard 6) in building, plumbing, and carpentry. No effective or adequate agreement has been reached with the European trade unions in the important matter of training Bantu artisans.

TYPES OF SECONDARY EDUCATION

The main types of secondary education in South Africa may be summarized as follows: (a) General secondary education—post-standard 5 in the case of European, Indian and Coloured pupils and post-standard 6 in the case of Bantu pupils. In most cases 3-year and 5-year courses are provided with varying attempts at differentiation. (b) Vocational education—which may be technical, commercial, or domestic science in vocational schools, providing, in the main, post-primary study. Some work, particularly technical, is partly secondary and partly post-secondary.

The technical colleges and vocational schools in general provide courses on a full-time basis but also part-time courses in general education, apprentice classes, technical and technological courses and a variety of short courses for interested adults who wish to improve a skill or learn a new hobby.

For those who leave the secondary school, further study may be done through technical institutions or correspondence colleges, the examinations of the Union Education Department being written as a rule.

All the provinces and the Union Education Department have vocational guidance services under the direction of an inspector of vocational guidance who is assisted by trained teachers who are also guidance workers in the secondary and high schools. They usually have special time set aside on the time-table for this purpose. Cumulative record cards are kept and completed in respect of each child, covering the whole school career. These cards reflect abilities, achievement, interests and so on and are sent on to each school the pupil attends. When a pupil leaves school, his card is submitted to the Department of Labour where it is used for vocational guidance purposes by juvenile employ-

ment officers attached to juvenile affairs boards. There are 15 such boards for Europeans and two for Coloureds functioning at present. Under the terms of the Registration for Employment Act (1945), these boards are responsible for vocational guidance and placement services in respect of juvenile work-seekers. Co-ordination of effort between the principals of schools and the education authorities generally on the one hand and those responsible for placement of juveniles on the other hand is of the utmost importance. An Inter-Departmental Advisory Committee for Vocational Guidance has been established, representative of the Union Department of Education, the Provincial Education Department, the Department of Labour, the Department of Social Welfare and the National Bureaux of Educational and Social Research and of Personnel Research respectively.

South Africa uses a four-term year. The school year is usually 200 school days (40 school weeks) in length, starting in mid-January or a little later and ending during the second week of December. The Christmas vacation is some five to six weeks in length. The school day varies, some schools in Natal favouring the two-session day with a luncheon break of approximately an hour, whilst others, e.g. in parts of the Transvaal, have a one-session day.

General secondary schools

The aim of these schools is to provide a general education. The needs of adolescents and the demand for vocational education have resulted, however, in the provincial secondary schools providing courses in commercial subjects, domestic science and agriculture. The general secondary schools will be described under the headings of the various controlling authorities.

Cape Province. The recommendations of the Commission on Technical and Vocational Education (1948) had considerable influence on the development of secondary education in the Cape. The full course is 5 years. The new junior secondary school course (12–15 years of age) may be described in detail. Its object is the general education of the child and it is intended to be a continuation of the primary school course after standard 5. The duration of the course is 3 years and it includes the following subjects (the subjects above the horizontal dividing line constitute the compulsory course for the 3 respective years, those below the line are optional subjects).

This table was published in 1953 and has since been amended (see below). Internal examinations are conducted at the end of the course with a view to certification. The Department conducts an external examination.

As from 1957, pupils in the third year must take the two official languages and general science as the only compulsory examination subjects, with the result that the candidate has a free choice of three optional subjects.

The Cape also conducts a post-primary vocational course of 3 years for mentally-retarded children. This leads to a vocational Junior Certificate comprising both official languages (one at a more advanced level), general science and social studies. This course is for the training of boys in one of the following: hairdressing, sheet-metal work, painting, plastering, spray-painting, sign-writing, panel-beating or carpentry; and for the training of girls in domestic science or hairdressing. Pupils who do not complete such a course are given a certificate of competence which indicates the standard reached by them.

1. Any two subjects, of which either general mathematics or social studies may be one, if not taken as a compulsory subject.

Natal. The final certificate to be obtained largely determines the subjects to be selected. There is a fair measure of differentiation within specific groups of subjects.

1. For Natal Senior Certificate with Matriculation Exemption, there are a number of variations which usually include first and second official languages, arithmetic, physical science or biology, and mathematics. The additional optional subjects are: (a) history and geography, *or* (b) history and Latin or French or German or art, *or* (c) Latin and art, *or* (d) geography and Latin or art or agriculture or German or geometrical drawing or housecrafts or handicrafts, *or* (e) German and housecraft, *or* (f) housecraft and shorthand-typing and book-keeping, *or* (g) geography and shorthand-typing or bookkeeping.

   The courses offered depend upon a number of factors, including the locality in which the school is situated and the teaching staff available for certain specialist subjects.
2. For those who wish to obtain the Natal Senior Certificate (which, without exemption, does not entitle the pupil to enter a university), there are a number of courses all comprising a common core of first and second official languages, arithmetic and physical science or biology. In addition, geography or health education, shorthand and typewriting and book-keeping may be taken, *or* geography, book-keeping and housecraft or handicrafts, *or* history, geography and housecraft or art.

3. For those who wish to or can only manage to obtain a Junior Certificate, there are several courses comprising a common core of first and second official languages, arithmetic, biology and housecraft. In addition, the pupil may choose book-keeping and typing or typing and shorthand or typing and social studies.
4. At the beginning of 1959 a new secondary course suitable for non-academic pupils was introduced. It consists of the following subjects: main language, second language, general mathematics, a science, history and geography (combined subject), an 2 other subjects selected from some 33 subjects offered for the Junior Certificate examination. This course commences in standard 7, the selection being made at the end of standard 6; the promotion requirements for the practical course are a little easier.

If the parent of a pupil who fulfils the requirements for promotion to the practical course only does not wish his child to take the course, the pupil may repeat standard 6 with the hope of qualifying for promotion to an academic course. The examination at the end of standard 8 is the same standard for both practical and academic courses.

Promotion in Natal is by attainment.

Transvaal. Since 1958, high schools are organized so that pupils are grouped according to ability and follow one or other of the streams mentioned below, within the same institution:

1. *A-Stream.* Those pupils who wish to take a post-matriculation course of study at a university or other institution for higher education (the University Entrance course).
2. *B-Stream.* Those pupils who do not wish to proceed to a university but nevertheless require education to the standard 10 stage as a basis for a future career (the standard 10 course).
3. *C-Stream.* Those pupils who do not wish to proceed beyond standard 8 or who will find it difficult to continue their studies beyond standard 8 (the standard 8 course).

The three streams do much the same work for the first six months in standard 6; thereafter differentiation takes place. The curriculum comprises compulsory and optional subjects within a weekly allocation of 25 teaching hours.

In standard 6, the compulsory subjects are religious instruction, home language, second language, arithmetic, history, geography, general science, industrial arts, physical education, hygiene, school music, art, vocational guidance and Bantu studies (approximately 23 hours). Optional are third language, mathematics, club work, agriculture (approximately 2 hours).

In standard 7, compulsory subjects are the same, but hygiene and geography are deleted (approximately 19–20 hours). The optional subjects are third language, mathematics, geography, book-keeping, business knowledge, typing, shorthand, hygiene (for girls only), agriculture, club work or any other approved subject.

In standard 8, subjects are the same as for standard 7, with a slight increase in time devoted to optional subjects. General mathematics is an alternative to arithmetic in standards 6 to 8.

In standards 9 and 10, the compulsory subjects are religious instruction, home language, second language, physical education and vocational guidance (approximately 10 hours a week). The remainder of the course (approximately 15 hours a week) consists of four or five optional subjects chosen from those approved for the Transvaal Secondary School Certificate and subjects such as school music and art.

The teaching of commercial subjects is restricted to one-third of the total number of school subjects and to not more than 8 hours a week.

The grouping of the pupils into the three streams is done mainly on the basis of intelligence quotient, though other factors like achievement, school record, principal's and teacher's opinions and the parents' wishes are also taken into account.

The Orange Free State. The rural nature of the province has resulted in the growth of many combined primary and secondary schools. The increasing development of separate high schools (23 in number, mostly co-educational), however, is a feature of the provision of secondary school facilities. In 1958, there were, in addition, 46 combined schools leading to standard 10 and 9 junior high schools (up to the eighth standard and all co-educational). There are also an agricultural high school and an agricultural and housecraft school; a number of high schools provide courses in agriculture or domestic science.

From 1955, standard 6 was incorporated in the high schools and the new secondary course introduced. This is a 3-year course in the middle school, the aim being to lead the pupils into definite fields of study—academic, technical, commercial and agricultural. Differentiation is gradually introduced, the final choice being left open until standards 9 and 10. Guidance has been introduced in the new course which also includes the official languages, general science, general mathematics, social studies, art, religious instruction, physical education and educational handicraft. A third language, commercial subjects, other handwork and so on are optional.

As the courses have developed, the academic, commercial and technical fields appear to be emerging as clear areas of study. Children are transferred to the secondary school at 13 years of age but the Free State has adopted the policy of promoting both by age and by achievement. The need for adjustment classes has been realized and is being studied. The syllabus provides additional material for those pupils who can benefit. Promotions are made internally, the class-record system having proved a success. Control tests, however, are conducted by the Department in Afrikaans, English, mathematics and general science, the scaled test mark in these subjects and the class-record for the year in the rest of the subjects being used to determine whether promotion is warranted or not.

Division of Bantu education. Some idea of the general junior certificate course may be obtained from the time-table on page 1122. In the clerical and commercial course, variations occur in the subjects of the second and third year.

Vocational and technical schools

The 11 technical colleges (one non-European) are multi-purpose institutions providing a number of different

TIME-TABLE FOR JUNIOR SECONDARY SCHOOLS
(BANTU EDUCATION)
(in hours per week)

Subject	Year	
	1	2 and 3

Physical education	1	1
Music and singing	1	1
Bantu language, Grade A or Grade B	3	4
Official language, Grade B or Grade C	4	4
Official language, Grade A	4½	4½
Arithmetic or general arithmetic, or commercial arithmetic or mathematics	3½	3½
Social studies	2½	2½
General science	3	–
A natural science (general science or physical science or biology)	–	2½
All other subjects	2½	2½
Morning assemblies and registration periods	1	1
Total	27½	27½

courses. Vocational high schools concentrate upon a particular field, e.g., technical high schools, housecraft high schools and commercial high schools. They are to be found mainly in rural areas. The courses are basically the same throughout the Union.

The number of teaching hours in most secondary schools is about 25 hours. Where workshop practice and other practical work is involved, as in many vocational high schools, the total may be 30 hours or more.

Commercial courses. No boy or girl is allowed to enter a commercial department unless standard 7 has been passed. This course does not usually lead to matriculation, but for those who desire it the National Senior Certificate may be taken. The standard 8 course comprises the following subjects as a rule: first and second official languages, book-keeping, commerce, typing and shorthand. When shorthand has been completed in the first official language, it is taken in the second language. Standards 9 and 10 are similar.

Technical courses. Boys enter after primary school. In standard 6, the subjects are first and second official languages, arithmetic, the elements of technical drawing, the elements of science, history and geography. In addition, six hours a week are spent in general workshops, the aim being to assist boys in finding out what trade they prefer—mechanical, electrical or building construction. Standards 7 and 8 comprise courses in the first and second official languages, mathematics, science (mainly physics), engineering drawing, trade theory (the scientific background to trades such as fitting, turning, electro-technics, welding, general motor mechanics, etc.). During these years, up to 12 hours a week are spent in workshops at the routine work of a trade. Most students receive workshop practice in other trades allied to their own.

At the end of standard 7 the boy may leave and enter a trade, and at least 60 per cent do leave by the end of standard 8.

Standards 9 and 10 comprise the matriculation course which consists of the first and second official languages, mathematics and physical science as the basic course, the same as the average high school. In addition, machine drawing, electro-technics and mechanics are taken. Some eight hours a week are spent in specialist workshops. In all years 7 to 10, several periods a week are allocated to history and geography and one period a fortnight to religious instruction.

Housecraft. These courses follow the same line as the commercial courses, first and second official languages, hygiene, physiology, cookery, millinery and dressmaking being offered.

Agriculture. Agricultural education is provided in provincial agricultural high schools where the course is basically general education with an agricultural bias. The Union Department of Agriculture conducts courses at four agricultural colleges, consisting of 2-year diploma courses, to which pupils are admitted on completion of standard 8. The instruction embraces the broader needs of agriculture in South Africa. Much attention is devoted to practical instruction, which absorbs 50 per cent of the student's time. A wide range of courses is taken, including animal and field husbandry, the operation and maintenance of farm machinery and carpentry.

Military training and institutions. The Department of Defence has established separate gymnasia for the army, navy and air force which boys of 16 or more years may enter for a 1-year course which may lead to selection for the permanent forces and, in the case of matriculants, to science degrees with a military bias. The General Botha Nautical Training College is now a state vocational school training boys for the merchant navy.

Under the terms of Act No. 13 of 1912 and Act No. 22 of 1922, all boys between their 12th and 17th years in urban or other populous areas may be required to undergo a prescribed course of cadet training unless their parents or guardians object. There are cadet detachments in all boys' secondary schools.

Nursing. Nursing education is conducted in provincial nursing colleges where the training is partly theoretical and partly practical, based on a 'block' system and spread over three and a half years. The age of admission varies, being as high as 18 years and as low as 16 years (in the Transvaal, where a cadet system operates). At present, the minimum educational qualification is standard 8 but it is likely that this requirement will be raised to standard 10.

Examinations

External examinations have gradually disappeared from provincial schools, except for the Junior Certificate in Natal and the Senior Certificate examinations conducted by each province. These examinations are under the control of the Joint Matriculation Board. The various provincial Education Department certificates are recognized as equivalent to the Matriculation Certificate (i.e., permitting admission to the university) provided that they conform

to certain requirements. There are 31 approved subjects for matriculation, 21 in Group A and 10 in Group B. Group A is divided into four groups, the candidate being obliged to take one subject from each group to include the following, the minimum mark for a pass being 40 per cent: (a) one of the official languages at the higher grade; (b) the second official language or another second language (higher or ordinary grade); (c) a science subject or mathematics; (d) a third language or mathematics (if not already included) or history or geography. In addition the candidate must obtain at least 33⅓ per cent of the marks in a fifth subject which must be either mathematics or a third language, if not already included. A sixth or seventh subject may also be taken.

A fairly representative grouping is first and second official languages, a third language, mathematics, a science and history.

A lower standard and a less rigid grouping of subjects are accepted by the provinces for the Senior or School Leaving Certificate. As examples: (a) Candidates for the Orange Free State School Leaving Certificate take six or seven subjects selected as follows: both official languages (one at the higher grade) and any four or five subjects selected from a wide range of subjects. Candidates from the agricultural high schools take the two official languages, agricultural science, biology, practical agriculture and farm management or mathematics. (b) In the Cape, candidates for the Senior Secondary Certificate must take both official languages (one at the higher grade), mathematics or a science selected from a group, and three further subjects selected from another language (Latin or Greek or Hebrew or French or German or a Native language, i.e., Xhosa, Tswana, Southern Sotho); literature (English or Afrikaans or Netherlands); mathematics; biology; zoology; botany; physical science; physics, chemistry; physiology and hygiene; agricultural science; geography, history; art or art-crafts; one of a group of handwork subjects; music; book-keeping and commercial arithmetic; shorthand; typewriting. Not more than four languages or two commercial subjects may be chosen.

The Union Education Department conducts national examinations for some 22 certificates including general education, commercial, technical and domestic science. Credit is given for every subject passed, contrary to the practice in the provincial education departments.

The Division of Bantu Education conducts its own Junior and Senior Certificate examinations.

Teacher training schools

All European teacher training is post-secondary.

In Indian education, the training of male teachers is rapidly becoming post-secondary, a two- or three-year course following upon the completion of a five-year secondary course. In Natal, Indians are trained at Springfield Training College, a college established in 1952. An increasing number of Indian men are completing a bachelor's degree and the University Education Diploma either at the University College of Fort Hare or the University of Natal. Indian girls take 2-year courses after Junior Certificate, a smaller group completing post-secondary school courses.

As regards Coloured teachers, training schools in the Cape offer 2-year courses after standard 8, a few training colleges conducting two- and three-year post-secondary courses. The Coloured Education Commission (1956) in the Cape Province recommended that Senior Certificate, followed by two years of training, be made the minimum required of new teachers. In 1956, 952 students were taking training courses which may be regarded as being at secondary level.

Except in a few subjects, less than 50 per cent of teachers in secondary schools for Coloured children possess degrees in the subjects they teach. The Commission considered that a university degree and a professional course should be the proper qualifications of secondary teachers, but that in the interim temporary relief should be provided by introducing a third-year course in academic subjects designed to meet the requirements of the junior secondary course, and that arrangements should be made whereby those who have completed a 2-year course at a training college could go on to take a first-year degree course at a university.

As a result of the Bantu Education Act, 1953, Bantu teacher training institutions were taken over by the secular Department of Education. The policy is to separate teacher training from other forms of education, although in many instances secondary schools are attached to the training institution. In 1958 there were 40 government Bantu training schools, all with hostel facilities. A few Roman Catholic training schools continue to function but they train, in effect, for their own private schools, their certificates not being recognized by the authorities.

The courses offered are as follows:

1. Lower Primary Teachers' Course, for which the entrance qualification is standard 6. This is a 3-year course, the first year being the same as the first year of the secondary school course. This course is limited to females who can teach up to standard 2, i.e., in the lower primary school. Some 34 training schools offer this course.
2. Higher Primary Teachers' Course, for which the entrance qualification is Junior Certificate (standard 8). Both men and women are accepted, the course taking 3 years. Of the total of 20,522 Bantu teachers, 1,675 were uncertificated in 1955. The great majority are engaged in teaching up to standard 4.
3. Bantu Teachers' Diploma. This is a post-secondary 1-year course, open to men and women. The training is for all classes of the primary school and also possibly some secondary school work. The training schools at Healdtown (Eastern Cape), Amanzimtoti (Natal) and Bantoe Normaal (Pretoria) conduct these courses. The University College of Fort Hare, the universities of Natal, Witwatersrand and Cape Town train non-European graduates on 1-year post-graduate courses. In the cases of the universities this form of training is likely to cease in the future but no date has as yet been set by the Union Government.

TRENDS AND PROBLEMS

In South Africa there is now a clear line of demarcation between primary and secondary schools at the end of standard 5, instead of standard 6, as was formerly the case.

The re-organization necessary, particularly with regard to the provision of accommodation in the high schools, is not yet complete. Bantu primary schools still include standard 6.

The upward trend of the compulsory school-leaving age for Europeans has resulted in all normal children spending two to three years in a secondary school. The establishing of special classes and schools has had the effect of making the lower secondary school classes more homogeneous. Several provinces transfer 13-year-olds out of the primary school into the secondary school whatever their educational attainments at that stage. The result is a need for special treatment for certain children thus transferred and for other backward adolescents at secondary school level.

Except for a small percentage who attend vocational schools, the great majority of European children attend provincial secondary schools.

There is a trend (well advanced) towards providing general education in junior secondary courses, i.e., 3 years up to and including standard 8 in most cases. The further 2 years to standard 10, however, are a continuation of the middle school. At first there were a number of such intermediate, junior high or junior secondary schools and a smaller number of high schools, but the trend is towards every provincial secondary school becoming a full-range 5-year school.

These schools provide a general education, standard 6 being an exploratory year, and differentiation increasing in standards 7 and 8. As a rule, there is a compulsory core of subjects, varying from province to province and an optional group which increases, whilst the compulsory group decreases, in number.

Vocational subjects are introduced, but here there are many problems. Should the secondary schools specialize along vocational lines or conduct vocational courses which are a part of the child's general education? The general line of development tends towards the second of these alternatives but the general public, and many parents and pupils themselves, want qualifications for work.

The control of vocational schools by one authority and that of the provincial secondary schools by another is having unfortunate results in that the natural development of comprehensive provincial secondary schools providing for all normal children of secondary school age is being adversely affected. In addition, the junior secondary work done in vocational schools tends to be vocational in outlook and practice and wants the introduction of more general education.

Differentiation is provided in provincial and private schools in different ways, usually by means of a choice of subjects which are grouped to suit the needs of different types of pupils. The Transvaal has embarked upon ability grouping, the three ability groups taking much the same compulsory core of subjects. There is, however, differentiation of syllabuses and methods to suit the different groups. The problem of effective selection is a real one but it is possible, so it is said, for pupils to transfer from one group to another.

The question of promotion and certification is occupying the attention of the educational authorities. Should promotion be based on achievement alone, on age alone or on both achievement and age? It would appear that South Africa considers that the achievement of sound standards is essential but that age must be a factor in determining the advisability or otherwise of promotion, especially where pupils who are older than the average in their groups are concerned.

External examinations at junior secondary school level have largely been abolished. There has been growing concern, however, over the maintenance of standards. Several provinces are experimenting with standardized tests in some subjects in order to assist schools and the Department of Education in keeping standards up.

The Senior Certificate (Matriculation Exemption) serves two purposes: (a) a qualification for entrance to the university; (b) a school leaving certificate. The developments in secondary education indicate that these two functions are not in accord. It is stated that there is a large group of pupils who do not proceed to the university but whose education is affected by university requirements. There is a movement afoot to separate the two, or alternatively to revise the examination pattern.

The shortage of secondary school teachers, particularly in certain subjects like mathematics, the sciences, commercial subjects and English seriously affects the developments considered above. There are many teachers, particularly temporary personnel, who are teaching subjects for which they are not qualified.

It is essential, if secondary education is to be successfully provided for all pupils according to their needs, that the general public be educated in this matter. Old ideas are not easy to change but this is what is most needed in the interests of adolescent boys and girls.

STATISTICS

Population (mid-year 1958 estimate): 14,418,000.
Area: 472,359 square miles; 1,223,409 square kilometres.
Population density: 31 per square mile; 12 per square kilometre.

Summary of school statistics, 1953–55. Total enrolment at all levels of education was about 2.1 million pupils in 1955 representing some 15 per cent of the population. There were, in addition, some 4,000 adults attending continuation classes. Of the total school enrolment 95 per cent were pupils in primary, general secondary and special schools, 3 per cent in vocational institutions, less than 1 per cent in all teacher training courses and just over 1 per cent in university colleges. Over two thirds of the primary and general secondary enrolment was in non-European schools. Girls made up about half the enrolment in primary and general secondary schools and 63 per cent in teacher training schools (secondary level). Teachers in primary and general secondary education numbered 58,644 in 1955 of whom half were women; the average pupil-teacher ratio in this group of schools was 33 in 1955. Information on the teaching staff at other levels of education is incomplete. Compared with 1953, total school enrolment had increased by 11 per cent in 1955. (See Table 2.)

Examination results in secondary education, 1953–55. In general secondary education some 6,477 candidates passed a Senior or Class I secondary certificate and over 20,000 a Junior or Class II certificate in 1955/56. (See Table 1.)

Educational finance, 1957/58. Complete details of expenditure on education are not available. In 1957/58 (fiscal year beginning April) recurring expenditure of the Union and provincial governments was provisionally estimated at 50,732,000 South African pounds, including Union government expenditure of £9,066,000 for Bantu education. Official exchange rate: 1 pound = 2.80 U.S. dollars.

1. Including data on kindergartens and some vocational secondary education.
2. Including data on special education and teacher training at secondary and higher education levels.
3. Number of schools and teachers in institutions providing pupils with the opportunity to learn a trade or craft whilst continuing scholastic training. These schools had 4,831 pupils in 1955.
4. Including part-time pupils numbering 53,317 in 1955.
5. Including part-time students.

Education in South West Africa is controlled by the provisions of the Education Proclamation, 1926. Schooling is compulsory for all European children between the ages of 7 and 16, or up to completion of standard 8 (tenth school year). The medium of instruction may be Afrikaans or English; since 1951 German was re-introduced as a medium, and is now used as far as the end of the primary school.

All financial and technical matters are controlled by the Administration of the Territory. Local school committees with mainly advisory functions are elected to represent the parents.

European schools. These may be maintained by the Government or by private bodies. In government schools, tuition is free but pupils pay for books and stationery; in boarding establishments maintained or assisted by the Government, fees are charged. In all cases there are remissions for families unable to meet the cost.

Private schools have to be registered and have to submit returns. They may be inspected free of charge and may receive subsidies towards the salaries of teachers.

The school plan comprises seven years of primary school (two grades, standards 1 to 5) followed by five years of secondary education. The primary school syllabus of the Cape Province has been adapted for use in South West Africa. At the secondary level, curricula are determined by the conditions of examining bodies in the Union of South Africa. After three years (end of standard 8) pupils sit for the Junior Certificate of the University of South Africa. Two further years of study bring them to the matriculation and school leaving examinations of the Joint Matriculation Board, which provide access to South African universities.

Coloured and Native schools. For the most part the education of Coloured and Native pupils is under the supervision of the various missions, which supply the buildings within the Police Zone. The Administration pays the salaries of the teachers, and supplies furniture and equipment free of charge. A rebate of 50 per cent is allowed on all books and stationery supplied to the schools for sale to pupils. The Government also maintains certain schools, and provides teacher training.

Since 1945 grants have been paid towards teachers' salaries, and subsidies have been given to certain native educational institutions beyond the Police Zone, i.e., in Ovamboland and the Okavango area.

UNION OF SOUTH AFRICA. BUREAU OF CENSUS AND STATISTICS. *Official yearbook of the Union of South Africa, 1956–57.* Pretoria, Government Printer, 1958. 981 p. 'South West Africa—Education', p. 971–3.

STATISTICS

Population (mid-year 1958 estimate): 539,000.
Area: 318,099 square miles; 823,876 square kilometres.
Population density: 1.7 per square mile; 0.7 per square kilometre.

Summary of school statistics, 1951–54. Total enrolment in 1954/55 in primary and secondary schools, including teacher training, was 40,650 pupils, representing under 9 per cent of the estimated population. The proportion of girls enrolled is not known. Approximately 28 per cent of the total enrolment were pupils in schools for European pupils. Compared with 1951/52, enrolment had increased by about 11 per cent. (See Table.)

Educational finance, 1954/55. Total expenditure on education in 1954/55 (fiscal year beginning April) was 971,751 South African pounds, representing about £2 per inhabitant. Available details of this expenditure are as follows: for administration, £13,274 (1.4 per cent); for inspection, £15,784 (1.6 per cent); education for Europeans, £761,550 (78.4 per cent); education for Natives and Coloured people, £181,143 (18.6 per cent). Official exchange rate: 1 pound = 2.80 U.S. dollars.)

1. Including data on teacher training.
2. Not including Native schools outside the Police Zone, numbering 162 in 1952/53.
3. Teachers in schools for Europeans only.

UNION OF SOVIET SOCIALIST REPUBLICS

THE EDUCATIONAL SYSTEM

Before the Great October Socialist Revolution of 1917, the broad mass of the people of Russia had no opportunity of obtaining education even at the primary level. According to the census figures, 76 per cent of the population aged 9 years and over were illiterate, with a figure of 88 per cent in the case of women. Among the non-Russian peoples of the central regions of Russia, and particularly of the so-called 'borderlands' (now the Kazak, Uzbek, Tadjik, Turkmen and Kirghiz Republics) it was rare to find a person who could read and write. The Tsarist Government pursued a policy of russification, doing everything possible to prevent the establishment of schools in which children were taught in their mother tongues.

Secondary education was provided in *gymnasia* and *real* schools (general secondary schools) and in technical and commercial schools (specialized i.e. vocational secondary schools). These were intended primarily for the well-to-do, for the sections of the population able to pay substantial fees for the education of their children. There was no general access to secondary education, and the schools had a clearly marked class character. There were also many restrictions based on nationality or religion; and boys and girls were educated separately. The total number of children attending secondary schools in 1914 was about 258,000. Education, as Lenin pointed out, had been turned into a 'fence' obstructing the access of workers' children to knowledge and culture.

The triumph of the October Revolution brought in its train a radical transformation of educational policy in general. The basis of the new policy was defined in the Communist Party's educational programme, the main heads of which were provision of free general and polytechnical education for children of both sexes up to 17, full implementation of the principle of the completely secular unified labour school with the mother tongue as the language of instruction and working along co-educational lines, developing close ties with socially productive labour, and training fully developed members of communist society.

The Soviet Government adopted a series of decrees abolishing educational restrictions based on class, nationality and religion. By the Decree of 21 January 1918, the Church was disestablished and the schools were secularized. Education was freed from religious influence during the very first years of Soviet power, and has since been carried out on a strictly scientific basis.

In addition, the equality of the sexes in education was guaranteed not only *de jure* but also *de facto*. The experience of co-education in Soviet schools shows that the quantum of knowledge imparted is assimilable by and equally necessary for boys and for girls. In the schools which provide general education, girls make up half the number of pupils. In the school year 1955/56, women constituted 54.8 per cent of the students of vocational secondary schools and 52.3 per cent of those at higher educational establishments. The fullest account is taken, under the Soviet system of public education, of ethnic and linguistic factors. More than forty nationalities have acquired a written

language during the years of Soviet power. All the peoples of the Soviet Union receive education in their mother tongue and have full access to the sources of education and culture.

The equal right of all citizens to education is guaranteed by the Constitution of the U.S.S.R. and by a whole system of state measures: compulsory 8-year general education; wide development of secondary education; abolition of fees for all types of education, whether secondary or higher; system of state scholarships at secondary and higher specialized schools, and organization in factories and on state and collective farms of free, industrial, technical and agronomic instruction for the workers.

The initial system of school education was based on the regulations governing the unified labour school (1918), and took the following form: a primary school for children aged 8 to 12, with a 4-year course, a 7-year secondary school i.e., a school with a 3-year course following the primary school course; and a 9-year or 'complete' secondary school with a 2-year course following the 7-year school course or a 5-year course following the primary school course; thus both types of secondary school, the 7-year and the 9-year, included four primary classes.

Starting from 1931, the course at the complete secondary school was extended by one year, so that the 9-year school was transformed into a 10-year school, with three senior classes (8th, 9th and 10th years). The reason for this step was the need for better preparation of general secondary school graduates for higher education.

The secondary school category also included the technicums (*tehnikumy*) and other specialized secondary schools where graduates of 7-year schools received a general and specialized secondary education fitting them for work in various sectors of the national economy or fields of cultural activity. Graduates of specialized secondary schools or 10-year general secondary schools had the right to continue their education at higher educational establishments of whatever kind.

The content and methods of instruction at both primary and secondary schools have undergone a radical transformation as compared with the pre-Revolutionary period. The curricula are based on strictly scientific principles ensuring the development of a scientific-materialist approach and inculcating a spirit of humanism, and respect for human dignity and for the peoples of other countries, combined with a spirit of Soviet patriotism, love for the socialist motherland, devotion to the building of Communism in the U.S.S.R. and an understanding of the need for peaceful co-existence between all States, including those with different social and political systems. To ensure the all-round development of the personality, the study of the natural sciences is judiciously combined with that of the humanities, and time is devoted to the teaching of music, singing, drawing and physical education. Scholastic activities are supplemented by various forms of leisure-time activity both in school and in out-of-school establishments, fuller details of which will be given later. In all these activities the interests of school-children in different grades are borne in mind.

The dogmatic verbal methods of instruction typical of the pre-Revolutionary school have given place to new methods which stimulate the pupils' activity and develop their powers of observation and independent thinking such as practical work in physics, chemistry and biology laboratories, excursions, the solution of practical problems related to real life, work with reference books, literary and historical source material, etc. Ever wider use is being made of the cinema in educational work.

At various stages in the development of Soviet education use had been made of the integrated method of constructing the curriculum, the project method and the team-laboratory method, by way of tribute in one form or another to educational innovations. However, experimentation, research and wide discussion of all these problems have led to the recognition that it would be wiser and more in line with sound pedagogy and psychology to draw up syllabuses for separate subjects, thus giving the pupils a systematic knowledge, and to apply various methods in class which stimulate the pupils' activity rather than try to replace them by any single universal method.

The reorganization of school education meant the extensive development of scientific research and methodological work and an improvement in the material basis of the schools, with special attention being paid to improving the qualifications and status of teachers.

The great merit of the educational system built up in earlier years is that it has produced fully literate people ready for higher education and possessing a solid grounding in science. But at the present stage of development of Soviet society, which is entering the period of large-scale communist construction, the schools in their present form no longer fully meet the needs of a dynamic society which has set itself the task during the next few years of creating the abundance of material and intellectual values essential for building Communism.

It has become necessary to strengthen still further the ties between school and life, that is, with the practical work of communist construction; a further improvement is called for in general and polytechnical education, based on the present level of achievement in science and technique and to some extent on the prospect of their future development.

The changed nature of the work performed by industrial and agricultural workers is already becoming quite evident today. They need to be able to handle highly developed machine-tools and the highest precision measuring and control instruments and devices, and understand intricate technical calculations and blueprints. Future technical and economic development will impose heavy demands on all workers in socialist society, and an all-round education is of vital importance for them. The labour of the present-day worker is not merely a matter of the use of muscle power; it is becoming increasingly filled with intellectual content. The gulf between mental and manual work, between the activity of the manual worker and the engineer or technician is being narrowed, and a process of qualitative alignment is taking place.

However, it would be a profound mistake to assert that with the development of technique and the automation of production manual labour will disappear. The gigantic advances in technique will immeasurably lighten manual labour and many back-breaking trades are disappearing and will continue to do so. But manual work will remain.

Hence the school, if it is to serve society well, cannot

stand aloof from manual work, which must form an organic part of the curriculum of every school and not merely of particular schools which prepare pupils for manual occupations.

The division of schools into two groups, some of which prepare young people for intellectual work and others for manual work, runs counter to the principle of equal educational opportunity and of the democratic organization of public education. In Soviet schools, manual work is compulsory for all pupils regardless of their future occupation and of whether they may ultimately select some sphere of intellectual activity.

No one questions the necessity of giving all children instruction in physics, chemistry, biology, mathematics, geography, history, literature and language, regardless of whether they will be philologists, engineers, historians or agronomists in their adult life, for the view taken is that a study of these traditionally established subjects ensures the all-round development of the personality and produces a young person who is 'educated' in the currently accepted meaning of that word.

A different point of view has prevailed, and still does, when it comes to manual work. It is accepted as a school subject, but only for schools which train young people for manual occupations in industry and agriculture. All other schools and their pupils, especially at the secondary stage, fight shy of manual work. In many cases, they regard it as something degrading which is the lot of the less gifted children.

Yet properly organized manual work adapted to the children's age-group capacities is a powerful means of ensuring the harmonious development of the personality, strengthening the body and increasing vitality. Another aspect of the pedagogical importance of varied manual work is that it brings home to the pupils the practical significance of the basic knowledge acquired at school, particularly of mathematics, drawing, physics, chemistry and biology, thus freeing instruction in these subjects from the abstract approach, which makes a conscious mastery of them so difficult.

The idea of bringing school education into contact with life and preparing pupils for practical work by combining teaching with productive labour was not based solely on the dictates of the technical and economic development of society which must be taken into account in organizing public education: if the school fails to meet the needs of a dynamic society and is divorced from life, it will not satisfy society or, what is more dangerous, give young people a reliable prospect of finding their place in life but will only breed frustration. The interests of society and the individual must be harmoniously united in the organization of school education. This union is effected by combining instruction and productive labour, for young people on leaving school will have been trained for practical participation in the building of Communism and will not find themselves at the crossroads, on the threshold of adult life, grappling with the agonizing problem of how and where to apply their powers and the knowledge they have acquired at school. All this takes on a special meaning and importance against the background of the Soviet Union's proclamation of the principle of the all-round development of secondary education so as to bring it within the reach of every boy and girl.

As already stated, the idea of combining school instruction with life, with reality, is of the most profound educational significance. It is the guiding principle of Marxist-Leninist pedagogy, as followed by school teachers and public education workers in the U.S.S.R.

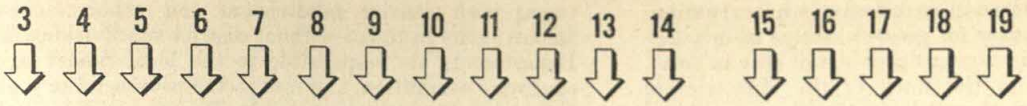
The practical ways of implementing these principles were described in the theses of the Central Committee of the Communist Party of the Soviet Union and the U.S.S.R. Council of Ministers on strengthening the ties between school and life and further developing the public education system in the U.S.S.R., which were presented in 1958 for nation-wide discussion.

The following figures give an idea of how extensive the discussion was: in the R.S.F.S.R., 199,000 meetings were held attended by over 13 million people, over 800,000 of whom put forward their views. In the Ukrainian S.S.R., there were over 90,000 meetings attended by some 10 million people, of whom over half-a-million spoke. Discussions on the same scale also took place in the other Union Republics, and there were lively debates in even the remotest parts of the country on the best way of reorganizing education.

On 24 December 1958, following this nation-wide discussion, the Supreme Soviet adopted the law on strengthening the ties between school and life and the further development of the public education system in the U.S.S.R. Under the law, the state system of education continues to be the only one in the U.S.S.R., thus making it possible to ensure that education is truly universal and fully available to all, and to apply consistently the principle of the unified nature of the school and the succession of all links in the chain of the public education system.

Radical changes are made in the structure of the school and the content of its work. General compulsory education from 7 to 14 years is replaced by an 8-year course of general compulsory education from 7 to 15–16 years, and the 7-year school is to be transformed accordingly—over a period of three years—into an 8-year school.

The structure of the school system is shown in the diagram on page 1131.



Administration

Full account is taken, in the system of direction and administration of public education, of the economic, ethnic, linguistic and cultural characteristics of the National Republics composing the U.S.S.R.

There is no All-Union Ministry of Education in the U.S.S.R. and education is entirely administered by the Councils of Ministers of the Union Republics through their respective Ministries of Education. Each Ministry is headed by a Minister of Education who is responsible to the Government of the Republic for the work of his Ministry.

The Union Republics include autonomous republics, autonomous regions and national areas. In the R.S.F.S.R., for example, there are 15 autonomous republics, 6 autonomous regions and 10 national areas, with national education being directed by Ministries of Education in the autonomous republics, and by regional and area Education Departments.

The existence of independent Ministries of Education in each Union and autonomous republic allows public

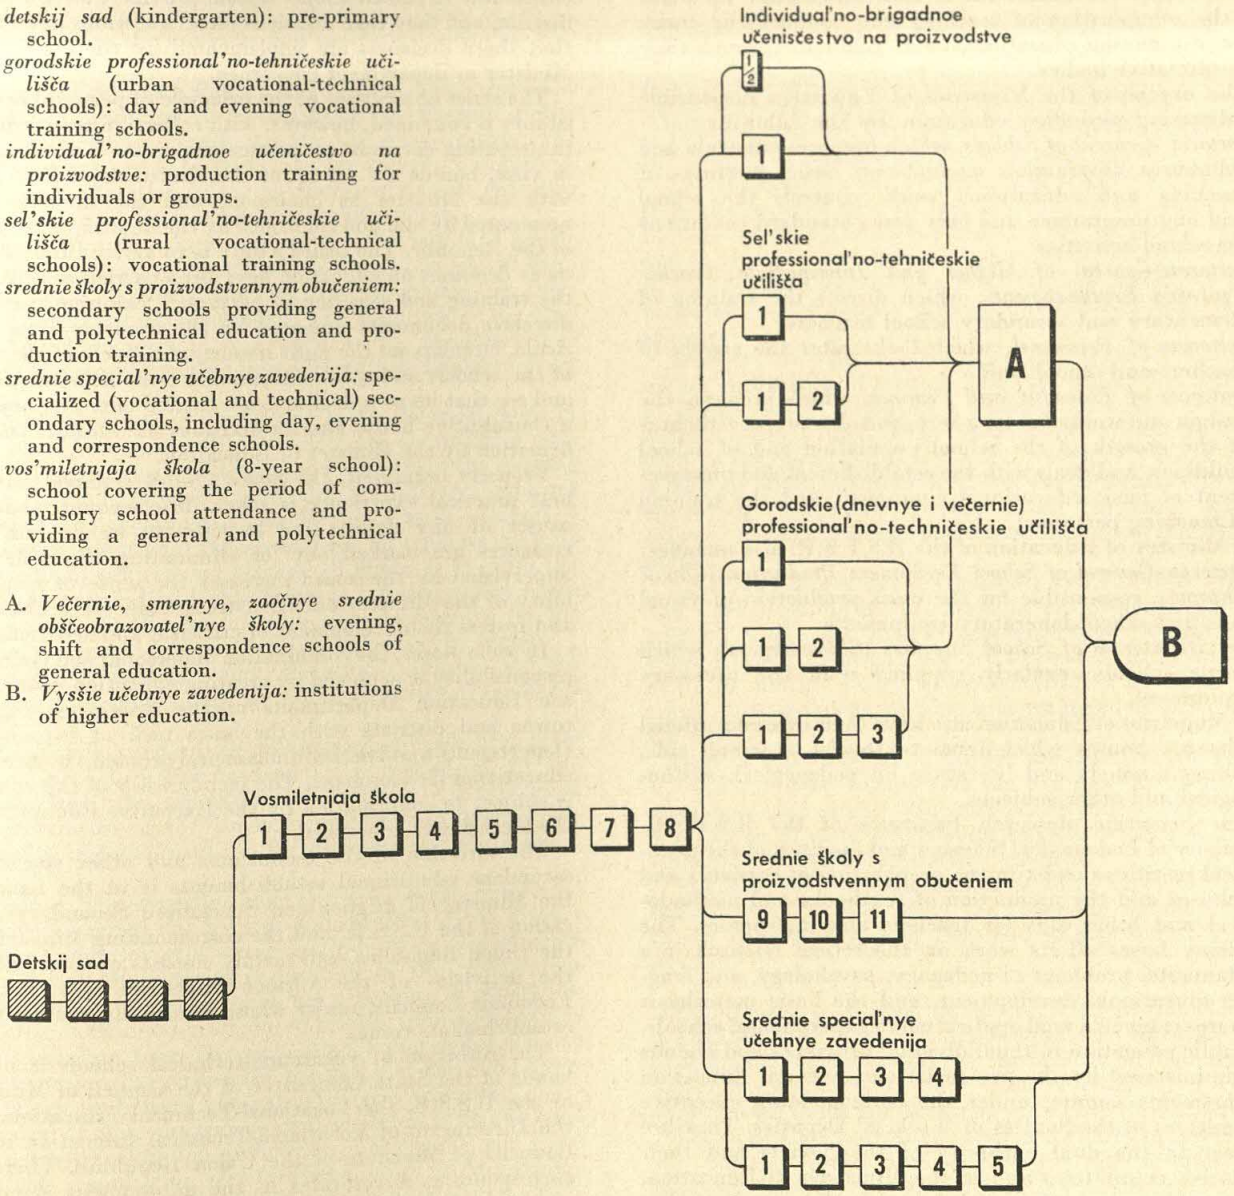
GLOSSARY

detskij sad (kindergarten): pre-primary school.

gorodskie professional'no-tehničeskie učilišča (urban vocational-technical schools): day and evening vocational training schools.

individual'no-brigadnoe učeničestvo na proizvodstve: production training for individuals or groups.

sel'skie professional'no-tehničeskie učilišča (rural vocational-technical schools): vocational training schools.



srednie školy s proizvodstvennym obučeniem: secondary schools providing general and polytechnical education and production training.

srednie special'nye učebnye zavedenija: specialized (vocational and technical) secondary schools, including day, evening and correspondence schools.

vos'miletnjaja škola (8-year school): school covering the period of compulsory school attendance and providing a general and polytechnical education.

A. *Večernie, smennye, zaočnye srednie obščeobrazovatel'nye školy:* evening, shift and correspondence schools of general education.

B. *Vyššie učebnye zavedenija:* institutions of higher education.

education to be administered in accordance with local national requirements, and makes for greater success in developing a culture socialist in content and nationalist in form.

The requisite unity in the work of the Ministries of Education is ensured by the all-Union legislation adopted by the Supreme Soviet of the U.S.S.R. and enacted by the Council of Ministers of the U.S.S.R. on the main educational questions.

The respective Ministries of Education draw up plans for the organization of teaching and conduct the entire work of directing educational establishments through their administrative bodies.

The organs of the Ministries of Education responsible for directing secondary education are the following.

Directorate-General of Schools, which prepares curricula and syllabuses, instruction manuals on basic questions of teaching and educational work, controls the school building programme and lays down standard conditions for school activities.

Directorate-General of Higher and Intermediate Teacher Training Establishments, which directs the training of elementary and secondary school teachers.

Directorate of Personnel, which looks after the supply of teachers and school staff.

Directorate of Planning and Finance, which prepares the budget and works out long-term and short-term estimates of the growth of the school population and of school buildings, and deals with the establishment and improvement of basic educational equipment and the training of teaching personnel.

The Ministry of Education of the R.S.F.S.R. also includes:

Directorate-General of School Equipment Production (*Glavuč tehprom*), responsible for the mass production of visual aids and school laboratory equipments.

Chief Directorate of School Supplies (*Glavsnabpros*), which keeps schools regularly supplied with the necessary equipment.

The Ministries of Education also have their own educational publishing houses which issue textbooks, teaching aids, teaching manuals and literature on pedagogical, methodological and other subjects.

The Scientific Research Institutes of the R.S.F.S.R. Academy of Pedagogical Sciences and faculties of the pedagogical institutes assist in the preparation of curricula and syllabuses and the production of textbooks and methodological and other aids for teachers and instructors. The academy bases all its work on theoretical research into fundamental problems of pedagogy, psychology, and long-term educational development, and the basic material it prepares is given a trial application in experimental schools.

Public education in the individual provinces and regions is administered by the provincial and regional Education Departments coming under the corresponding executive committees of the Soviets of Workers' Deputies. They are subject to the dual authority of the Soviets and their executive committees and of the Ministries of Education, thus enabling due weight to be given both to local requirements and to the need for uniformity in the solution of all basic problems.

The immediate administration of schools and other educational establishments is in the hands of district Education Departments in rural districts and in large towns with district subdivisions and urban Education Departments in towns without district subdivisions. These Departments are responsible to the local Soviet and its executive committee, and also to the provincial or regional Education Department or to the Ministry of Education of the autonomous Republic.

The Ministers of Education and heads of Education Departments are personally responsible for the educational curriculum in the Republic, region, province, area, town or district, and they take decisions on all questions and ensure that those decisions are implemented by the staff of the Ministry or department concerned.

The strict observance of the principle of personal responsibility is combined, however, with collective responsibility in preparing decisions on particular points. With that end in view, boards are set up at the Ministries of Education with the Minister as chairman, and the members are nominated by him and confirmed by the Council of Ministers of the Republic. The board's duty is to verify that government decisions on education have been carried out, discuss the training and selection of personnel, examine the basic directive documents prepared by the ministry staff (curricula, circulars on the most important aspects of the work of the schools and other educational establishments, etc.), and see that its own decisions are carried out. The board is a consultative body, and its decisions are subject to confirmation by the Minister of Education.

Properly organized, the board's work ensures that the best practical experience is taken into account, that the causes of any defects are brought to light, and that measures are worked out for eliminating those defects. Supervision by the board increases the sense of responsibility of the Ministry officials, strengthens state discipline and fosters the development of criticism and self-criticism.

In some places, the combination of personal and collective responsibility is achieved by creating education councils in the Education Departments of the provinces, regions, towns and districts with the basic task of helping the Departments to solve the fundamental problems of directing educational development. The membership of the councils is subject to confirmation by the Executive Committee of the local Soviet concerned.

The direction of the technicums and other specialized secondary educational establishments is in the hands of the Ministry of Higher and Specialized Secondary Education of the U.S.S.R. and the corresponding Ministries of the Union Republics, and mainly consists of co-ordinating the activities of the various Ministries and National Economic Councils, under whose immediate control those establishments come.

The direction of vocational-technical schools is in the hands of the State Committee of the Council of Ministers of the U.S.S.R. for Vocational-Technical Education, and the Directorate of Vocational-Technical Education of the Councils of Ministers of the Union Republics. There are corresponding directorates in the autonomous republics, regions and provinces.

The headmaster directs the educational and administrative work of the school. His main tasks, which he carries out in conjunction with the director of studies, are to organize the teaching staff, ensure that all parts of the school machine function smoothly, acquaint himself with

all aspects of the work of the teachers and pupils and keep a constant watch over it, eliminate shortcomings and to single out and publicize useful teaching experience.

He relies in his work on the support of public bodies and the parents. The latter are represented by the Parents' Committee, which assists the school in the general education and polytechnical training of the children, the organization of out-of-school activities, the dissemination of educational propaganda among the parents, the development of school amenities from the domestic and sanitary standpoint, and so on.

Every school has a Pedagogical Council which discusses educational problems. It comprises all the teachers at the school, the senior Pioneer leader, the school doctor, the chief librarian and the chairman of the Parents' Committee, with the headmaster acting as chairman, and its decisions take effect after the headmaster's confirmation.

To organize the educational work of the pupils of grades 5–11, the headmaster appoints individual class leaders from among the experienced teaching staff; in grades 1–4, their own teachers act as class leaders. The main task of the class leaders (whose work is supervised by the headmaster) is to knit the pupils together into a friendly and hard-working team.

For the purpose of conducting methodological work in the school, studying and systematizing outstanding educational experience and helping the teachers in the training and education of the pupils, the headmaster organizes seminars on teaching methods for teachers of grades 1–4 and commissions on teaching methods for separate subjects or groups of subjects for teachers of grades 5–11, with the most experienced and able teachers in charge. The headmaster and the director of studies are responsible for the conduct of methodological work in the school in general.

The senior Pioneer leader, the school librarian and the school doctor come under the direct authority of the headmaster.

The training and advanced training of heads of departments, inspectors and headmasters is carried out by the Central Institutes for In-Service Training of Educational Administrators of the Union Republics, and by the provincial or regional institutes for advanced teacher training.

Inspection. The inspection of all types of general educational schools is carried out by school inspectors of the district or urban and provincial or regional Education Departments and of the Ministries of Education of the autonomous republics. The inspector, with the assistance of experts on teaching methods from advanced teacher training institutes and specialists from factories, state farms and collective farms, personally verifies the execution of the state plans laid down for general compulsory 7-year education, polytechnical training and vocational training, tests the level of knowledge, skill and proficiency of the pupils and looks into the organization of educational work in the school. His task is not merely one of inspection, it is part of his responsibility to help the headmaster and teachers in their work.

The inspectors are appointed from among the best teachers and headmasters who are graduates of higher teacher training establishments and have a record of leadership and educational activity. Inspectors of district or urban Education Departments must have had at least five years' experience, and inspectors of provincial or regional Education Departments and Ministries of Education at least seven years' experience.

The other bodies (such as Parents' Committees) have no authority to supervise the work of the school.

The inspectors of the Ministries of Education inspect the work of the local education authorities.

Finance. The source of funds for the central and local administrative bodies is the U.S.S.R. state budget. All types of educational establishment and the bodies administering them are supported entirely by the State.

The financial support given to the schools is based on the number of pupils and classes in each school.

The construction and equipment of schools are financed from the state budget. Of late years, there has been great increase in school building financed by collective farms, and in this way two forms of property have been created in the Soviet Union—state property and collective farm property—which jointly provide the material basis of the schools.

Teachers are paid in accordance with their level of education and length of service. The rate of pay for teachers of grades 1–4 is based on a 24-hour working week or a 4-hour working day, while teachers of grades 5–11 are paid on the basis of 18 hours' work a week or 3 hours' work a day. In addition teachers receive supplementary pay for correcting the pupils' exercise books (subjects: mother tongue, Russian, foreign languages, literature and mathematics).

Teachers who act as class leaders, or direct subject-rooms and workshops, or are in charge of out-of-school physical training work, also receive supplementary pay for these types of work. Their pay rises by 10 per cent after intervals of 5, 10 and 25 years. In addition, after 25 years they receive a long-service pension amounting to 40 per cent of their pay.

Only a state system of public education exists in the U.S.S.R., and no tuition fees are charged. At specialized secondary and higher educational establishments, there is a system of state scholarships payable to all pupils and students who make satisfactory progress.

The increase in the amount devoted to education in the U.S.S.R. can be seen from the following figures: it was 22,489 million roubles in 1940 and 94,300 million roubles in 1959.

Buildings and equipment. School building in the U.S.S.R. is financed from state and public funds. To facilitate mass production, standard plans are drawn up to educational and hygienic specifications. This work is done by a special State Institute for the Planning of School Buildings.

Classrooms are built to the standard of 1.25 square metres per person. Apart from classrooms, the schools have teaching laboratories and laboratory assistants' rooms, specially equipped workshops for woodwork and metalwork, medical rooms, staff common rooms, etc.

Gymnasia are provided in all schools with over 280 pupils. In schools designed to accommodate 520 pupils or more, there are assembly halls, in some cases combined with a dining room. In schools with 920 places and over, there is

an assembly hall with a stage, and a dining room with separate kitchen facilities.

Assistance in preparing school building plans is given by the various institutes of the Academy of Building and Architecture, by the R.S.F.S.R. Academy of Pedagogical Sciences and by pedagogical scientists and working teachers.

School welfare services. Everyone in the U.S.S.R., including schoolchildren, is entitled to free medical care. In the case of secondary schoolchildren, these services are provided by special school doctors assisted by nurses and trained in pædiatrics and hygiene. They form part of the staff of the polyclinical department of children's hospitals, and are appointed by the local health authorities, under whose guidance and supervision they work. In places where there is no possibility of allocating special doctors to give medical attention in schools, the duties of school doctors devolve upon other doctors (in the country, on divisional doctors or doctors from the local hospital and in districts, on the district children's doctor).

The school doctor's main functions are: to observe the state of health and physical development of the children; to organize and provide the necessary medical and preventive care; to give advice and assistance to teachers in the organization and execution of their educational work—and especially in physical training—in accordance with the children's age and state of health; to make an early diagnosis and prevent the spread of diseases, and particularly infectious diseases in the school; to observe and check the sanitary condition of the school and ensure that the school administration takes the necessary measures of sanitation and hygiene; and to conduct health-education work and propaganda to spread a knowledge of hygiene among the children, parents and staff.

In pursuance of the above tasks, he prepares a concrete plan of work, discusses it with the school administration and submits it for approval to the appropriate health authorities.

As one of the means of ensuring that the system of universal compulsory 8-year education is carried into effect and secondary education developed, school hostels are being established and school transport facilities provided. In mountain districts, in the Far North and in districts of nomadic pastoralism, children living in boarding establishments attached to incomplete and complete secondary schools are maintained entirely by the State.

TYPES OF SECONDARY EDUCATION

The 8-year school is an incomplete secondary school designed to give pupils a firm grounding in general and polytechnical knowledge, to inculcate a love of work and a readiness to carry out socially useful activity, and to provide moral, physical and æsthetic education. As far as possible it must prepare the pupils for various types of work so as to permit them, with the help of teachers and parents, to make a deliberate choice of the course of their further education at schools providing a full secondary education and vocational training. The teaching staff of the 8-year school may advise the pupils and parents concerning the choice of further instruction, but the final decision rests with the latter. There are no special examinations in Soviet schools to determine the capabilities of the children and their level of intellectual development, and a system of 5 marks—5, 4, 3, 2 and 1—is employed by the teachers to show the standards attained in school subjects. The last two marks indicate that the pupils have fallen short of syllabus requirements.

The time-table for the four senior classes of the 8-year school, forming the first link in the chain of secondary education, is divided as follows: 43.2 per cent for the humanities [the native language, literature, history (including the Soviet Constitution), a foreign language, drawing, music and singing], 35.1 per cent for the natural sciences and mathematics (mathematics, physics, chemistry, biology, physical geography, technical drawing), 15.2 per cent for work training of all kinds and 6.5 per cent for physical training.

In grades 5–8, work training is carried out in the workshops for woodwork and metalwork, in the home economics room and on the schools' experimental farm plots. Apart from hand tools, the workshops are equipped with machine tools suited to the pupil's age. The curriculum provides for work not only in, but also out of school—poultry-keeping, nursery gardening, construction and repair of school equipment, rearing of small domestic animals, assistance to collective farms in tending young livestock, etc. Home economics is studied mainly by girls, but in some forms also by boys.

There is no question of training pupils for any particular career. Their work forms an integral part of what is termed polytechnical education, with the teachers of natural sciences and mathematics utilizing the experience acquired by the pupils and bringing them to a scientific interpretation of the various labour processes both in the workshops and on the school experimental farm plots, showing the application of scientific laws in various kinds of technical equipment, methods of plant cultivation, etc. In other words, the school work has an educational character and does not consist simply of inculcating familiarity with the use of tools and the conduct of particular operations.

The above analysis of the time spent on the various groups of subjects in the 8-year school shows that conditions are provided for the all-round development of the pupils, including their æsthetic and physical education.

Class instruction is supplemented by various types of out-of-school activities which take account of the interests and inclinations of the individual pupils. The sports lovers join sports clubs, those interested in art join amateur art groups, those interested in technical subjects choose technical groups, and so on, and adequate funds are provided in the school budgets for the conduct of these groups. There are also special out-of-school establishments where the needs and interests of the individual pupils can be still more fully met, and where their talents can develop and come to full flower. More will be said later concerning these establishments.

On graduation from the compulsory 8-year school, the pupils (and their parents) are free to choose the course of further education. Those wishing to have a full secondary education and acquire at the same time training for a particular practical occupation, enter the 'secondary labour

polytechnical school providing a general education together with production training' (hereinafter referred to as the senior secondary polytechnical school); those wishing to have general and specialized vocational secondary education enter the technicums and other specialized secondary educational establishments (for teacher training, public health, economics, commerce, etc.); those wishing to have a quicker vocational training without full secondary education can enter a vocational-technical school.

These three types of secondary educational establishments following the 8-year compulsory school are defined in the Law of 24 December 1958. The law also provides for a special type of school for young people and adults who are engaged in productive work in various organizations and establishments but who have not completed their secondary education—the so-called evening (shift) general secondary school.

Let us deal briefly with each of these types of general and specialized secondary school.

The senior secondary polytechnical school

In a 3-year course this type of school gives young people who have completed the 8-year school a full secondary education, prepares and qualifies them for entering any higher educational establishment, and provides vocational training for work in some branch of the national economy or cultural life.

Boys and girls not entering a higher educational establishment on leaving this school do not find themselves at a dead end, for they will have mastered a trade and can take up work feeling that they have a place in society.

These secondary schools are established either separately with three grades (9th, 10th and 11th school years) or in combination with the 8-year school, and are gradually replacing the 10-year school. The one-year's extension of the period of education is dictated by the changed pattern of schooling, with general education being supplemented by training in one of the mass occupations and accompanied by an intensification of work training. It would be difficult, without this extension, to find a solution to the new tasks arising, with the law envisaging the necessity for still further raising the level of general and polytechnical education and producing educated people with a good knowledge of the fundamentals of science.

In order to continue the work of all-round development and education initiated by the 8-year school, and to solve certain special problems confronting the full secondary school, the apportionment of time proposed for the various subjects is as follows: 30 per cent for the humanities (literature, history, Soviet Constitution, economic geography, foreign language); 31 per cent for the natural sciences and mathematics (mathematics, physics, chemistry, biology, astronomy, draughtsmanship); 33.3 per cent for production training (theoretical and practical) and productive labour; and 5.5 per cent for physical education. In addition, two hours a week are set aside in all three grades (9–11), for optional subjects. The pupils can devote themselves during that time to whatever particularly interests them, at their own choice—selected questions from a particular science or branches of technology, questions relating to the theory and history of art, various types of sport, and so on. The object of the optional subjects is to ensure that the pupil's individual interests are more fully met and deepened, and his abilities developed to their fullest extent. To promote æsthetic education, meanwhile, the schools have choral groups for which special funds are provided in their budgets.

The new element in the work of these reorganized secondary schools is theoretical and practical production training, to which one-third of the time of each class is devoted. In contrast to the 8-year school, where work training takes place in the school workshops and on the school's experimental farm plot, they conduct their production training directly, in factories and workshops and on construction sites and state or collective farms. Only in certain cases where the necessary production facilities are not available in the neighbourhood of the school does the training take place in the schools themselves or in inter-school educational-production workshops complete with suitable machine-tool equipment.

The term 'production training' is used in a broad sense. In the first place, it refers to the work of pupils in industrial and agricultural production, into which the majority of young people find their way owing to the particular structure of the national economy. But there is also a demand for manpower in trade, catering establishments and public and state services. A certain number of schools give special training to their pupils and arrange for their production training in these fields.

The theoretical side of production training is handled by physics, chemistry and biology teachers who have the necessary experience, or by specialists from industrial and agricultural enterprises—engineers, technicians and agronomists—while the practical instruction is given by skilled workers whose services are specially enlisted for that purpose.

In the schools based on factories or workshops, for production training, the pupils usually do productive work two days a week and study general education subjects in class for the other four. In rural schools, this arrangement is not always possible owing to the seasonal nature of agricultural work. Hence at certain periods of the school year the pupils do productive work for only a few days and then return to their general education. During the season, 54 days are devoted to productive labour in each grade (9–11). The maximum length of the working day both in urban and rural schools is six hours. The pupils receive wages calculated according to their output.

Production training and general education, particularly in the natural sciences and mathematics, are not parallel processes without point of contact. They are intimately linked and interdependent. In their practical work, the pupils use blueprints and make mathematical calculations, i.e., they exploit the knowledge they are acquiring at school. In studying machinery, machine-tools and technical equipment, they observe the practical application of the laws of physics to technology, and in chemical production they see the application of the the laws of chemistry. The study of the technology of many materials is closely bound up with chemistry and biology. An understanding of agricultural practice, for instance, rests on the theoretical basis of the knowledge acquired in studying biology. Theory and practice cross-fertilize each other and awaken an inquiring and creative spirit in the pupil's mind.

The organization of production training in these schools is a complicated matter, but the solution of the difficulties arising is made easier by the fact that in the U.S.S.R. there are only state enterprises or community enterprises (the collective farms). In some cases, these make considerable sacrifices in order to solve the problem so important to the State and nation, of improving the training of young people for life and for active participation in building a communist society.

But man's life in society is not limited to his daily work. He has his leisure, his free time. With the completion of the change-over in the U.S.S.R. to the 7-hour working day (and in some branches of heavy industry to the 6-hour day), the workers are getting more and more free time; and that time can only be well spent if people have varied cultural demands and tastes to be met, and are interested in music, literature, the theatre, the cinema and public affairs, both at home and abroad. The humanities provide a training for these qualities of the human personality and for its moral development.

To solve the complex tasks confronting the schools, the correct balance between the teaching of the natural sciences and the humanities and the correct correlation between general education and practical training have to be found, and the Soviet school curricula have been drawn up with this in mind.

Each secondary school prepares its pupils for from one to three careers. On leaving his 8-year school, the pupil chooses the secondary school he wishes to enter, depending on his interests and inclinations. The staffing of these schools to meet the pupils' interests is extremely difficult: certain vocations may be popular but not of great moment to the national economy, whereas others may not be particularly popular but are vitally necessary to the national economy. This clash of interests can be resolved without serious harm to the community or individual if definite efforts are made to mould the interests of the pupils through the agency of the school itself, the cinema, radio, television, children's literature and other means so as to meet the needs of the national economy for particular trades.

Interest is not something innate; it arises, and is moulded and strengthened, under the various influences of life itself. This process may be spontaneous, in which case it is very unsatisfactory, or it may be controlled. The school and society are equipped with adequate means of explanation, persuasion and demonstration to enable them to bring out the attractive aspects of a particular occupation and captivate young people by its inner romance. This was a difficult matter when heavy labour required the mere use of physical strength but is immeasurably easier now that muscle power is giving way to the power of the machine, when the mechanization and automation of production are developing apace and the worker's main task is machine operation.

Provided the pupils' interests are directed and moulded, the problems involved in completing secondary schooling by production training become considerably less acute not only in the towns, where a whole network of schools exists, but also in rural areas, where a sufficiently wide choice of occupations can also be assured. The state and collective farms are both highly mechanized in the Soviet Union and require the services of large numbers of tractor drivers, combine operators, electricians, radio operators and specialists in machine maintenance (turners, fitters, milling-machine operators, etc.).

The career for which the boys or girls have been trained in the secondary school is not necessarily a lifetime one. They have the opportunity of changing it if they wish, and they can learn another trade in their own enterprise by taking the appropriate courses. In addition, young people who have had a full secondary education have extensive facilities for access to higher educational establishments of all kinds. For example, a turner or milling-machine operator seeking further education does not necessarily have to enter a higher technical establishment but can become a doctor, teacher, lawyer or linguist. It all depends on his personal wishes. Nor does he necessarily have to give up his work in order to enter a higher educational establishment: young people can also follow the courses organized by the correspondence and evening departments of those establishments without giving up their jobs.

Side by side with the reorganization of the content of education, steps are being taken to perfect the organization and methods of instruction. The class lesson is the basic element but is not the sole form of educational activity. Independent work with books, manuals and reference literature is widely encouraged, and the same applies as regards measuring instruments and laboratory equipment, calculation and graph work, systematic nature study, experimental work on school farm-plots, excursions, etc.

Boarding schools form part of the 8-year and 11-year secondary school system. The State, by establishing these schools, gives assistance to families in bringing up children. Admission is subject to the parents' wishes, and holidays and 'days off' are spent at home. Boarding fees are charged based on the parents' earnings, but orphans and children from large families are maintained entirely by the State. By 1965, the number of children at boarding schools will total 2,500,000.

There are special schools for the general education of children gifted in music, dancing and the graphic arts.

For delicate children, there is a network of country sanatorium and convalescent schools situated in suitable surroundings where the classwork and out-of-school activities are carried on in the open if climatic conditions permit. The pupils are under the observation of children's doctors. The general education schools also include special schools for mentally or physically handicapped children.

Technicums and other specialized secondary schools

Technicians, as the immediate organizers of production, and other workers with specialized secondary education play a vital part in industrial and agricultural production and in the work of cultural, educational and public health institutions.

At the technicums and other specialized secondary schools, graduates of 8-year schools receive a general secondary education (entitling them to access to higher educational establishments), a working trade (at technical and agricultural schools) and a specialized secondary education. Children can be admitted to technicums immediately on leaving the 8-year school or after several years of work in production or in an institution. There is

an entrance examination. The training at the specialized secondary schools can be full-time or spare-time (at correspondence and evening departments, in the latter case, with the departments giving preference to persons working in trades related to the specialities chosen).

The technicums and other specialized secondary schools cover a wide range of branches, for they train specialists for all sectors of the national economy, culture, education and public health. The course of instruction lasts 4 years as a rule, but may vary to suit the special training of young people for particular jobs.

Some of these schools are organized on the basis of full secondary education, i.e., they take young people who have completed their secondary schooling, and their courses are somewhat shorter than in those which take young people from 8-year schools.

The training of these middle-level specialists is also conducted on the basis of close links with socially useful productive labour. The interests of modern production, based on the latest achievements of science and technology, require technicum graduates to have a high degree of theoretical training and a sound practical knowledge.

The practical training takes place in enterprises, organizations and institutions corresponding to the trainee's speciality. The industrial technicums have shops and workshops where the students turn out industrial products, and the agricultural technicums have large farms where the students themselves do all the basic work.

Vocational-technical schools

The primary task of this type of school is to provide planned and organized training for skilled workers for industry, building and agriculture, on the basis of active and systematic participation in productive labour in close conjunction with enterprises, construction sites and state and collective farms, and it caters for graduates of 8-year schools who wish to enter production. The course lasts from 1 to 3 years in urban schools and from 1 to 2 years in rural schools.

The main emphasis during the course is on enabling the pupils to master the selected trade both through work in the school workshops and through direct participation in productive work on the job. They also study various specialized and general subjects essential for a better grasp of their speciality.

The vocational-technical school does not offer a full secondary education, and pupils completing the course—provided they have had 8-years' schooling—can enter a technicum and take either a spare-time course (at the evening or correspondence department) or a full-time course if they are able to leave their employment. But the road to higher education is also open to pupils completing courses at vocational-technical schools provided they first complete a spare-time course of secondary education at a general secondary school for adults, about which more will be said later.

Vocational-technical schools are replacing the various types of vocational school which existed prior to the Law of 24 December 1958—trade, railway, mining, building, factory and agricultural mechanization schools—but although the nomenclature has been unified, they continue to specialize in particular branches of production. The reorganization process is to be completed within three to five years. Full maintenance (food and clothing) is provided by the State for orphans and children from large families, the other pupils being paid at apprentices' rates.

Evening (shift) secondary schools

These schools are intended for young and adult workers in industry and institutions who have not had a full secondary education, and they provide instruction on a spare-time basis. The length of the course for those who have had an 8-year education is 3 years. Shift-workers working on the first shift take evening courses and those working on the second shift take day courses. Hence the name. In rural areas, the study arrangements are based not on shifts but on seasonal considerations, depending on the course of agricultural work.

In accordance with the Law of 24 December 1958, these schools are replacing the secondary schools for young workers and peasants, and like the latter they provide a full secondary education and qualify graduates for entrance to higher educational establishments.

They give 20 hours of instruction a week including 15 hours for class-work, 3 hours for tutorials and 2 hours for optional subjects for improving the students' trade rating. The total teaching time is divided up among the various subject-groups as follows: humanities 32.5 per cent (literature, history, Soviet Constitution, economic geography, foreign language); natural sciences 42.5 per cent (mathematics, physics, astronomy, chemistry, biology, draftsmanship); optional subjects for improving trade rating 10 per cent; and tutorials 15 per cent. No special time is allotted for physical training, as the pupils get this during their working hours.

There are some young and adult workers who did not receive a full 7-year education before entering employment and the evening (shift) schools are therefore running classes for the third to eighth school year as a temporary measure.

About two million people are at present studying in these schools, and a further increase in the number of schools and pupils is planned in the near future, for the number of people wishing to complete their education by spare-time study is growing steadily, especially among members of communist labour brigades, who have set themselves the task not only of increasing productivity in order to fulfil the seven-year plan ahead of time but also of acquiring full secondary education.

There is nothing fortuitous about the young workers' thirst for knowledge: it is the result of the increasingly widespread introduction into industry and agriculture of complicated modern technology, and the development of the mechanization, automation and chemicalization of production, the application of electronics, the use of computers, etc.

Another stimulus to educational development and cultural uplift is the nature of social life in the Soviet Union. The workers take a large part in the activities of the trade unions and public voluntary bodies and in the political life of the country. Millions of young people are grouped together in the Young Communist League. The press, radio, cinema and television daily acquaint tens

of millions of workers with new facts about the development of culture, technology, science and art, many of which—especially in the field of science and technology—can only be understood by people who have at least had secondary education. All this encourages people to go on with their schooling.

Moreover, the evening (shift) schools not only provide general education but also help to improve the students' trade rating, and this is a further incentive to spare-time study.

The State and society are taking steps to meet the personal wishes of the individual members of the public by creating the necessary conditions for providing them with a full secondary education, both in the interests of the technical and economic development of the country and for the sake of raising of general cultural standards. Students doing well in their spare-time studies are released from their jobs for one day a week on half-pay. If they so wish, they can also be released for one or two days more without pay.

The development of secondary schools for young workers is in no way inconsistent with the development of the secondary general educational schools providing production training which pupils enter immediately on finishing their 8-year education. It is a question of equalizing the proportionate coverage by secondary education of the various categories of young people so as to make secondary education essentially universal in the interests of the development of Soviet society on the road to Communism.

The main idea behind the present reform of the public education system is to ensure that the younger generation shall be much better prepared for life, for socially useful work, and for enriching the cultural life of the nation, for Communism requires an abundance of intellectual as well as material values.

Teacher training schools

Teachers for grades 1–4 are trained at teacher training schools which have a 4-year course of study and are open to young people of both sexes who have completed the 7-year school. In view of the introduction of universal compulsory 8-year education, entrants will be required in future to have reached this level. There is also another type of training institution, with a 2-year course, which takes students who have had a full secondary education.

Side by side with general education subjects, the teacher training school curriculum includes manual work, singing, drawing and physical training. Great attention is paid to methods of teaching all subjects of the primary school curriculum, to the science and history of pedagogics and to psychology and school hygiene. A considerable number of hours are devoted to practical work in the workshops and in agriculture, and to teaching practice in grades 1–4.

Entry to teacher training schools is by competitive examination. Preference is given to candidates who have shown a bent for work with children and have experience of public work in the Pioneer organization, at summer kindergartens, in the children's rooms of house committees, etc. On completing their training, the students take the state examinations, which qualify them to teach grades 1–4, where all subjects are taught by the same teacher.

Faculties for the advanced training of teachers for grades 1–4 have now been established at pedagogical institutes, and it is intended that the number of these will be progressively increased.

Out-of-class activities

Apart from the various types of school, educational work with children is being carried on at over 10,000 extra-scholastic establishments in the U.S.S.R., while adult education establishments of various kinds are also drawn into out-of-school work among children. All these establishments supplement the schools' work of strengthening and deepening the children's knowledge by developing the creative capacities, interests and tastes of millions of Soviet schoolchildren.

To ensure the systematic direction of the work of extra-scholastic establishments, centres have been set up for young technicians, young naturalists, young tourists, etc.

There are some 2,500 Pioneer and schoolchildren's palaces and homes in the U.S.S.R. which cater for work with children in the field of science, technology, literature, art and sports. The Pioneer palaces and homes are of great help to the schools in developing various out-of-class activities, and they also organize and stage general events such as Bird Day, Forest Day, Garden Week, flower festivals and Pioneer rallies and bonfire nights.

As has already been stated, classwork in schools is supplemented by out-of-class activities which develop the creative powers and capacities of the pupils. Teachers organize this work, and draw on the initiative of the children themselves and their capacity for independent action in getting them to solve various questions of school life. The heart and soul of all out-of-class and out-of-school activities are the Pioneer, Young Communist, and teachers' organizations, which arrange gatherings, debates, competititons for various types of art activity, sports festivals and exhibitions of the pupils' work, arrange exchanges of correspondence with schoolchildren abroad, and so on.

Out-of-class and out-of-school work is being brought into even closer relation with life and with practical socialist construction. Particularly noteworthy in this connexion is the work of the Young Naturalists' centres, which encourage interest in agricultural work, publicize Michurin's teachings, familiarize schoolchildren with the achievements of biological science, encourage them to participate to the best of their ability in protecting nature and planting trees in villages and towns, and inculcate sound practices in tillage, horticulture, animal husbandry and market gardening. These centres have their own study-workshops, model farm plots for experimental and teaching purposes, hot-houses, 'nature corners', meteorological stations and laboratories of various kinds. Their work is co-ordinated by the Central Organization of Young Naturalists, which was founded in 1918.

The Young Naturalists have become a mass movement, and over 400,000 Pioneers and schoolchildren belong to Young Naturalist groups in the R.S.F.S.R. alone. Meanwhile, practically all village schools, and many urban schools, have their school gardens and fields on which they raise cereals, fodder-crops and industrial crops, plant nurseries of seedling trees, shrubs, fruiting plants and

flowers, and grow valuable new kinds of plants for their districts.

The special Young Naturalists' pavilion at the All-Union Exhibition of the Achievements of the National Economy in Moscow, gives an idea of the outstanding achievements of the Young Naturalists and displays interesting examples of their work. Annual meetings of Young Naturalists are held on both the Union and Republic level at which they can exchange experiences.

Young Technicians' Centres also occupy an important place in out-of-school activities. In 1926, the Shvernik National Young Technicians' Centre was established in Moscow and has became the hub of the organization of out-of-school technical activities. The curricula for the various technical groups are worked out at the National Centre on the basis of experimental work with children and literature is published on methods of work. Provincial, town and district Young Technicians' Centres carry out practical activities, hold seminars with the leaders of school groups, arrange courses, sum up and disseminate the results of most successful experience of work in the technical fields, arrange exhibitions, run competitions, etc.

Thousands of examples of schoolchildren's work on display at the All-Union Exhibition of Children's Technical Work testify to the great achievements of children in the design and manufacture of working models of various machines and of physical, chemical, mathematical and other equipment. Model aircraft making and radiotechnical work are particularly popular.

The regular slogans for the competitions, contests, exhibitions and other nation-wide activities staged are 'Think it out, work it out, try it out', and 'If you've learned—teach your friends', and the result is to arouse interest and attract millions of schoolchildren to technical work.

Extra-scholastic establishments are also very active in promoting the artistic education of children. Choirs and dance groups have been formed in many of the Pioneer homes and palaces, and there are thousands of groups, orchestras and studios for developing child talent in music, ballet, dramatics, the graphic arts and declamation. Lectures and talks on art and meetings with leading artists are also arranged. Every year there are schoolchildren's amateur dramatic contests, festivals and olympiads.

To develop the perceptive faculties of children and organize leisure-time cultural activities in Pioneer homes and palaces, 'games libraries' have been established which supply children free of charge with games for temporary use at home, issue schools and children's homes with a selection of games for Pioneer units and detachments, organize branch libraries on main thoroughfares and in childrens' parks, and stage nation-wide games contests by correspondence.

Every school has its physical culture groups to which the great bulk of the children belong. The number of children's sports groups organized at schools and within the sports clubs of the trades unions and voluntary sports associations is increasing year by year.

There are over a thousand special children's sports schools in the U.S.S.R.

It has become traditional to hold athletic and sports contests, football matches and cycle races for young people on a district, province, town and republic basis. Every year, there are All-Union schoolchildren's *Spartakiads* for athletics, gymnastics, swimming, basket-ball, volley-ball and other types of sport. Millions of schoolchildren take part in these contests and *Spartakiads*, and they have at their disposal their own stadiums, children's sections of adults' stadiums, and numerous sports fields, swimming pools and skiing grounds. Leading Soviet sportsmen are recruited for work with children and there are many children's sections for various types of sport, working under experienced trainers.

The State and the trade unions devote considerable sums to the support of various recreational facilities. In 1958 alone, over 6 million children and adolescents spent holidays at camp or at children's sanatoria or excursion centres.

For those who remain in town during the summer there are the recreation grounds attached to schools, and parks run by the house committees.

Children's libraries and children's departments of adult libraries organize readers' conferences, meetings with writers and literary discussions, set up book-lovers' groups and collect and analyse readers' opinions on books. The schoolchildren take an enthusiastic part in repairing books, preparing book exhibitions and producing handwritten literary magazines.

The publication of literature for children and young people progresses in quantity and quality year by year. The State Publishing House for Children's Literature (Detgiz), which was established in 1936, has so far issued a total of over 500 million books.

The services of outstanding teachers and foremost writers, artists, scientists and travellers are enlisted for producing children's books.

A total of 137 newspapers and 37 magazines for children and young people are published in the U.S.S.R.

Since 1944, a Children's Book Week has been regularly held during the spring holidays as a national event, with many meetings arranged between writers and poets and their young readers, literary evenings, lectures and book fairs.

In 1950, the Children's Book House was established by the R.S.F.S.R. Ministry of Education for scientific and practical work in connexion with children's literature and the systematic organization of children's reading. It has a unique collection of children's books, does mass work among children and studies the interests and needs of young readers in close liaison with the authors catering for them.

The Houses of Culture in the large enterprises have children's rest-rooms, reading rooms, games libraries, homework rooms and lecture rooms.

Engineers and technicians at factories run children's technical construction groups and young technicians' clubs.

The children's railways installed by the Ministry of Communications are extremely popular.

TRENDS AND PROBLEMS

The law on strengthening the ties between school and life, and further developing the public education system in the U.S.S.R., laid down a work programme covering several

years for the education authorities and all types of general educational and specialized schools.

A period of three to five years will be required for transforming existing schools into the new types specified by the law.

The basic problems are those of a purely educational nature—the improvement of curricula to meet the new tasks confronting each type of school and the special needs of the various age-groups, the preparation and publication of new types of textbook, the planning and production of new types of visual aid, machine-shop and laboratory equipment, and a review of current handbooks on teaching methods.

No less important is the strengthening of the 'infrastructure' of education—enlargement of premises, construction of many new buildings, planning of buildings in the light of the tasks to be carried out by the various types of school and of school hygiene requirements, and planning and production of better types of school furniture.

Much work lies ahead in raising the qualifications of teachers, especially of teachers of subjects connected with polytechnical education and the practical training of children for life.

Once labour becomes an organic part of the pupils' work and production training in the senior grades is conducted outside the school confines—in factories and workshops, on collective and state farms—the problems of organizing the children's life and rearing them in the spirit of Communism, Soviet patriotism and internationalism will assume a different aspect.

It will be the task of the Ministries of Education of the Union Republics to solve this set of problems during the next few years in close collaboration with teachers and industrial and agricultural specialists and with the help of pedagogical scientists, psychologists, health experts and specialists in the various fields of natural science and the humanities.

STATISTICS

Population (Census 15 January 1959): 208,826,000.
Area: 8,649,821 square miles; 22,403,000 square kilometres.
Population density: 24 per square mile; 9 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58 enrolment in educational institutions from pre-primary to university level (including evening schools and correspondence courses) was 34.8 million pupils, representing about 17 per cent of the total population. There were in addition some 1,900,000 students enrolled in adult education courses and 900,000 more taking part in various vocational post-school courses. Of total enrolment, 6 per cent were pupils in kindergartens, about 49 per cent in primary schools or in the first four grades of the 7, 10 and 11 year schools. Another 33 per cent of enrolment was in general secondary schools, 5 per cent in vocational and secondary teacher training schools and over 2 per cent in higher teacher training. Students attending university and technical colleges represented 4 per cent of total enrolment. Children in special schools for the handicapped were 0.3 per cent. No specific figures are available on the number of girls enrolled at any level of education. The teaching staff in all pre-primary, primary and secondary schools numbered 1,945,400 in 1957/58 and the average pupil-teacher ratio at all primary and secondary schools was about 17. Enrolment at the primary level (first 4 grades) increased by 40 per cent between 1953 and 1957, but at the secondary level (grades 5–11) there was a progressive diminution in enrolment amounting to a loss of 36 per cent over the same period. This is explained by the lower birth rate during the war years. However, in higher teacher training colleges and university colleges there has been a steady increase in enrolment since 1953. Secondary teacher training enrolment has declined since the beginning of the period under review, probably due to increasing emphasis on post-secondary teacher training. (See Table 2.)

Enrolment trends in secondary education, 1950–57. Table 3 shows the enrolment trends in the upper grades (8–11) of the general secondary schools, and in vocational and teacher training schools, including pupils in evening schools and correspondence courses. A decline in general secondary education after 1955 is due mainly to the population effects of the last war. The average total enrolment at the upper secondary level for the period 1955–57 represented some 36 per cent of the estimated population 15–19 years old.

Examination results in secondary education, 1954/57. Over a million students were awarded diplomas in general, vocational and teacher training schools at secondary level during 1957/58 compared with 662,600 diplomas granted by the same schools in 1954/55. Most professional schools awarded a higher number of diplomas in 1957/58, but not secondary teacher training schools, whose enrolment has steadily declined since 1950. (See Table 4.)

Educational finance, 1957. Total expenditure on education during the year 1957 was 93,700 million roubles representing approximately 468 roubles per inhabitant. The state budget contributed 86 per cent of receipts, and, apart from a small sum contributed by the social security budget, the remaining 14 per cent were derived from state enterprises and co-operatives. (See Table 1.)

UNITED ARAB REPUBLIC

The unification of the republics of Egypt and Syria to form the United Arab Republic was proclaimed in February 1958, and the Principles of Unity adopted in a general plebiscite. The Provisional Constitution provides for a President as Head of State, who shall assume the executive authority. Legislative authority is vested in the National Assembly, the seat of which is in Cairo, the capital of the Republic. The President appoints Ministers and each Minister undertakes supervision of the affairs of his Ministry and implements the general policy laid down by the President.

By October 1958, Presidential Decrees had been issued concerning the formation of a Central Government (*Hukūma Markazia*) for the Republic, and an Executive Council (*Majlis Tanfidhi*) for each Region (*Iqlim*): Egypt and Syria. Another decree was issued to regulate and co-ordinate their functions and work. The chief concern of the Central Ministry of Education is to lay down, in collaboration with the two executive (i.e. regional) Ministries of Education, the public educational policy of the Republic at national level. Each Regional Ministry of Education in concerned with the implementation of public policy in its Region.

From the educational and cultural point of view, there have always been strong ties between Syria and Egypt, and thus there were many similarities in the educational systems even before the Cultural Treaty of 1957 or unification in 1958. It was therefore easy and natural to reorganize and unify educational systems and curricula in the two regions.

THE EDUCATIONAL SYSTEM

The separate Egyptian and Syrian Constitutions in effect at the time of unification vested responsibility for education in each of the respective States.

Article 21 of the revised Syrian Constitution adopted in 1953 proclaimed the right of every citizen to education, the defined object being 'the creation of a generation strong in body and mind, believing in God, equipped with knowledge and the higher moral qualities, aware of its Arab heritage and its rights and responsibilities, working in the interests of the public and possessing a spirit of co-operation and brotherhood among all fellow-citizens'. Article 28 stated, *inter alia*, that all institutions of learning in the country were to be under the supervision of the State.

Among other educational provisions the 1956 Egyptian Constitution included the following:

Article 50. 'The State exercises control over public education regulated by law. Throughout the various stages in state schools, education is given free of charge within the limits defined by law.'

Article 51. 'Primary education is compulsory, and free in state schools.'

Legislative provisions operative when the Provisional Constitution of the United Arab Republic came into force remain valid within the territorial limits stipulated at the time of their promulgation; they may be repealed or amended in accordance with the Provisional Constitution. Thus the following laws are still in force: (a) the 1953 Egyptian Law concerning secondary (senior high school) education; (b) the 1957 Egyptian Law concerning preparatory (junior high school) education; (c) the 1956 Egyptian Law concerning primary education; (d) the 1944 Syrian Laws Nos. 121, 202.

In 1958 a Presidential Decree, No. 160, was issued authorizing the Ministries in the two Regions to exercise jurisdiction over public and private education except for those activities assigned to other Ministries.

The Republic is divided into 31 educational zones (22 in the Region of Egypt and 9 in the Region of Syria), which co-operate with the three Ministries in policy-making. The trend is towards complete decentralization into local governments, each of which will be responsible for all public services, including education, in its respective area.

There are some private agencies which run a number of schools at different levels under the supervision of public educational authorities. Adult education is, at present, the responsibility of the Ministry of Culture and National Guidance.

The structure of the school system is shown in the diagram on page 1147.

THE DEVELOPMENT OF SECONDARY EDUCATION

Secondary education was introduced in the first half of the nineteenth century, as an intermediate stage in the so-called 'modern educational system'. Its function was to provide higher schools, the students of which were to be a recruitment source for civil or military servants of the Government.

Increasing national consciousness in both Syria and Egypt, accompanied by the social and economic changes that have taken place since the beginning of the twentieth century, led to the expansion and reorganization of secondary education.

In Egypt, the period of study was five years, the course for the last two years being divided into two sections: literary and scientific. In 1935 the period of specialization was reduced to one year but the number of sections was increased to three: literary, scientific and mathematical. Thus general secondary education covered a period of four years.

In 1952 the whole educational system in Egypt was revised and became a 4-4-3 system (primary, lower secondary, and upper secondary). A further change was made in 1956 to a system of 6-3-3 years (primary, preparatory and secondary). The three secondary school years were divided into one year of general studies and two of specialization either in arts or in science.

Technical education began as a parallel system to the last stage of primary education. It was then placed after primary education, and then again parallel to the upper stage of secondary education. At present there are three stages of technical education: preparatory, secondary and higher—corresponding to the three successive stages of general education above primary level.

In Syria under French mandate, the period of secondary education was seven years, preceded by five years of primary education. In 1944, under the Arab Government, the period of secondary education was reduced to six years, the first four being the intermediate stage and the last two the preparatory stage. The intermediate (lower secondary) stage was equivalent to the first four years of general education in the Egyptian secondary school. The Syrian preparatory stage (upper secondary) was divided, like the final year in the Egyptian secondary school, into scientific and literary sections. In 1952 the preparatory stage (upper secondary) was extended to three years, thus bringing the total period of secondary education to seven years.

Before 1944 there were also two types of post-primary complementary course: a general course of four years, without a second foreign language, and vocational courses. Both types led to technical schools, most of which offered courses of three years. The law of 1944 did away with the complementary courses and the Ministry was entitled to add commercial, agricultural and technical classes to any intermediate school if the need arose.

Since the cultural treaty signed in 1957, the two countries have adopted the same educational system of 6-3-3- years—primary, preparatory, and secondary.

For technical education the Region of Syria has adopted a pattern that is practically the same as that used in Egypt.

Legal basis

Secondary Education Law No. 211, 1953 (now being revised to bring it into conformity with the provisions of the Cultural Treaty and unification).

Preparatory Education Law No. 55, 1957 (dividing secondary education into two independent stages: lower and upper, each with its own objectives).

Secondary Education Law No. 566, 1958, for the Region of Syria (repealing the provisions of previous laws).

Technical Education Law No. 22, 1956 (concerning industrial instruction in both lower and upper stages of secondary education).

Technical Education Law No. 262, 1956 (concerning agricultural instruction in both stages).

Technical Education Law No. 261, 1956 (concerning commercial instruction in both stages).

Technical Education Law No. 1010, 1958, for the Region of Syria (organizing the three types of technical education).

Private Education Decree No. 160 (authorizing the ministries in the two regions to exercise jurisdiction over public and private education).

Administration

Organs of the Central Ministry of Education concerned with secondary education are:

The Higher Board of Planning, which is presided over by the Central Minister of Education and on which both Regional Ministries of Education are represented.

The permanent committees for general secondary and for technical secondary education (agricultural, commercial and industrial: one committee for each). There are also permanent committees for each subject.

The Directorate of Secondary Education, which is composed of experts and research workers.

Separate directorates of agricultural, commercial, industrial education.

An Under-Secretary of State responsible for planning, assisted by a Secretary-General and a Documentation Centre for Education.

A technical adviser for all branches and stages of technical instruction.

Both the Regional Ministries of Education are represented on every board and committee by experts and research workers and where appropriate by administrators, inspectors, principals, teachers, businessmen and other persons with special interests in particular educational problems.

Decisions of the Central Ministry concerning educational plans, curricula, programmes, organization, administrative measures are transmitted through the Under-Secretaries of State for the three Ministries to the respective department directors in both regions and to the administrative bodies and schools in the various zones.

There is a body of general inspectors for secondary education in each Regional Ministry, and an inspectorate attached to the Central Ministry of Education which 'follows up' and sees to it that the educational system is working efficiently.

Inspectors of secondary education are chosen from among the most efficient assistant principals and senior masters of secondary schools and principals of preparatory schools. They are required to be highly qualified and to have had at least 10 years' experience.

Every zonal administration has its own body of inspectors. Technical schools have consultative councils that help the principals in technical and administrative matters. Nearly every school has its parent-teacher association.

Finance. General and technical secondary education are free in public schools. In technical schools lunch is provided free of charge.

The Central Government has its own budget and allocates the funds required to finance the Central Ministry of Education. Both Regional Ministries of Education draw upon their own separate budgets to finance education in their respective regions. They provide for school buildings and the payment of teachers' salaries.

Private schools may be subsidized by the Regional Ministry of Education to help them to offer free education (particularly at primary level). Some subsidized schools are even staffed and supplied by Regional Ministries of Education, while others appoint their own staffs.

Buildings and equipment. In both regions there are special authorities responsible for the building of such school premises as educational requirements may demand, in conformity with the approved standards of space, sanitation, heating and lighting.

The school building authority in the Region of Egypt dates back to 1953 when a scheme was introduced with the object of replacing old unserviceable schools by new ones and providing the premises called for by the approved plan, to meet the growing demand for educational facilities.

A similar authority was set up in the Region of Syria and has already begun to discharge its responsibilities effectively.

GLOSSARY

al-ḳism al-thānawi bi ma'āhed al-tarbiya al-mūsiḳiya lil-mu'allimīn wal-mu'allimāt: teacher training schools of music (secondary section).

ḥaḍāna; pre-primary school.

ḥifẓ al-Kur'ān: Koranic schools.

ibtidā'i: primary school.

ibtidā'iyat al-Azhar: primary section of schools providing the al-Azhar course.

i'dādi (preparatory): schools referred to in text as 'preparatory' are categorized here as 'lower secondary'.

i'dādi 'ām: lower general secondary school.

i'dādi 'amali (practical preparatory): lower general secondary school with terminal course.

i'dādi fanni lil-banāt: lower vocational secondary school for girls.

i'dādi kulliyāt al-sharī'a: specialized lower secondary school with training in Islamic law.

i'dādi mushtarak: multilateral lower vocational secondary school.

i'dadi ṣinā'i; lower vocational secondary school for industrial occupations.

i'dādi tijāri: lower vocational secondary school of commerce.

i'dādi zirā'i: lower vocational secondary school of agriculture.

ma'had al-mūsiḳa al-sharḳiya: Institute of Oriental Music.

madāris al-mu'allimīn wal-mu'allimāt al-'amah wal-rīfiya: general and rural teacher training schools.

madāris al-tarbiyah al-riyāḍiyah lil-mu'allimīn wal-mu'allimāt: teacher training schools for physical education.

madrasat al-mumarriḍāt wal-hakīmāt: nursing and midwifery school.

madrasat al-zā'irāt al-ṣiḥḥiyāt al-ijtimā'iyat; vocational training school for social welfare and health officials.

shu'bat al-ādāb: literature section.

shu'bat al-'ulūm; science section.

thānawi 'ām; upper general secondary school with differentiation into literature and science courses.

thānawi kulliyāt al-sharī'a: specialized upper secondary school with training in Islamic law.

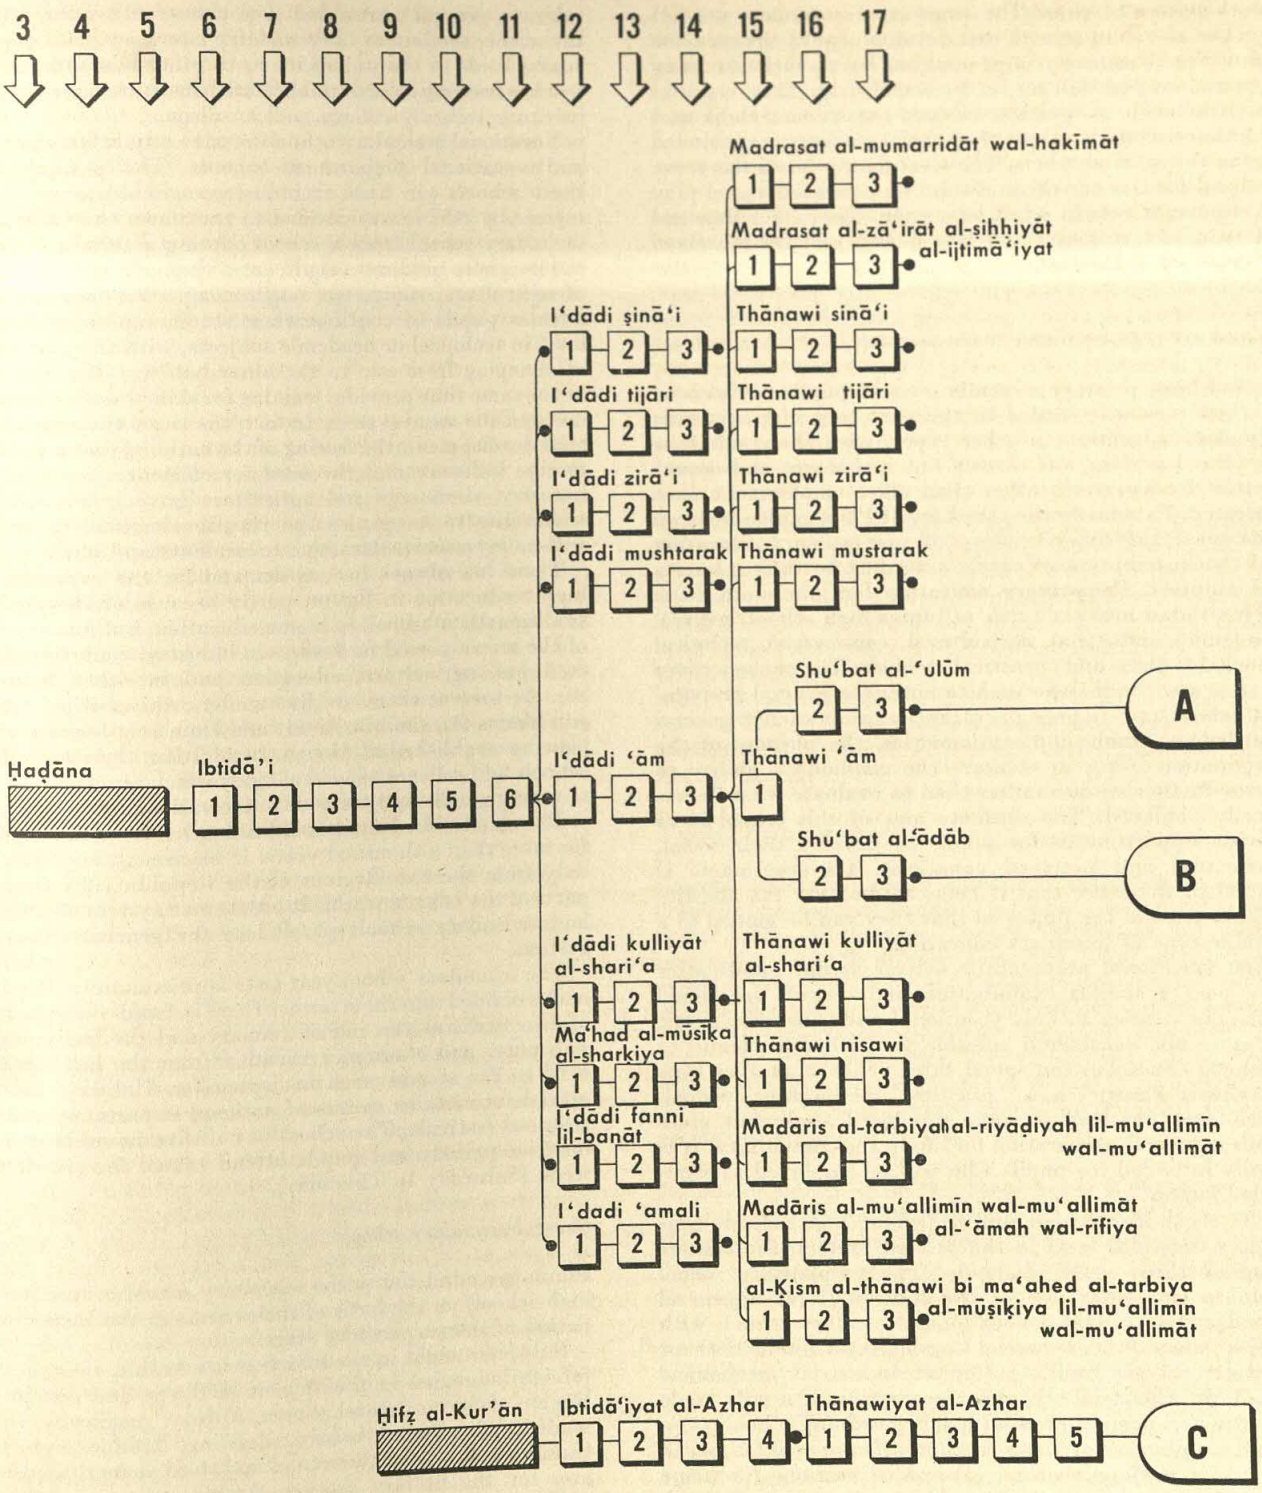
thānawi mushtarak: secondary polytechnical school.

thānawi nisawi: upper vocational secondary school for girls.

thānawi ṣinā'i: upper vocational secondary school for industrial occupations.

thānawi tijāri; upper vocational secondary school of commerce.

thānawi zirā'i: upper vocational secondary school of agriculture.



thānawiyat al-Azhar: secondary section of schools providing the al-Azhar course.

HIGHER EDUCATION

A. Higher institutes and faculties requiring entrants to have graduated from science section of upper secondary school.

B. Higher institutes and faculties requiring entrants to have graduated from literature section of upper secondary school.

C. al-Azhar University.

School welfare services. The concern of secondary schools with the all-round growth and development of the students and of the community in general has led to their assuming increased responsibilities in the social field. They organize activities such as parties, camps, excursions, clubs and athletic contests, and qualified social workers are included among the staff members. The secondary schools also serve as social centres for the surrounding community and play an important role in adult education. They offer financial aid to needy students and free health services in school hospitals or in the home.

TYPES OF SECONDARY EDUCATION

On finishing primary education, most pupils—influenced by their parents—tended in the past to prefer academic secondary education to other types, with the result that the school system was thrown out of balance and opportunities for vocations other than office employment were neglected. To remedy this, the Law of 1956 emphasized two principles: the differentiation of post-primary education and the distribution of pupils according to their interests and abilities. Preparatory education has, therefore, been differentiated into six types of junior high school: general (academic), industrial, agricultural, commercial, technical schools for girls, and 'practical' schools. The courses cover three years. Pupils who wish to enter the general preparatory school have to pass an entrance examination in general knowledge, Arabic and mathematics, the purpose of the examination being to measure the candidate's ability to pursue further studies rather than to evaluate what he has already achieved. The ultimate aim of this school is to provide opportunities for pupils to develop their social, intellectual and practical capacities. Its programme is general in the sense that it helps to discover the abilities and interests of the pupils so that they can be guided to a suitable type of secondary education.

The vocational preparatory schools accept pupils after they pass a similar examination and certain vocational tests. The courses include vocational and general subjects.

Pupils not considered suitable for either academic or technical education can spend three years in another type of school, known as a 'practical' preparatory school, which does not lead to more advanced study but gives pupils a general preparation for life in the community. It is mainly intended for pupils who will be employed as semi-skilled labour.

The secondary school proper (senior high school) constitutes the third level in the present system, the courses being of three years' duration. The preparatory school graduate can enter one of the following: (a) a general secondary school; (b) a vocational secondary school, with a bias towards commercial, agricultural, industrial or domestic science training; (c) an industrial mechanical school, an industrial school for decoration, a textile trade school; (d) a general or rural teacher training school; (e) a school for physical training teachers; (f) a school for health and social welfare visitors; (g) special sections for home economics and music education; (h) a polytechnical school.

Nearly half of the graduates of preparatory schools enter general secondary schools where they spend the first year taking a general course and then choose either the arts or the science section for the remaining two years. This general course leads to the university or to other institutions, e.g. teacher training college, public health institute, accountancy institute, military college, police college.

Vocational secondary schools receive pupils from general and vocational preparatory schools. The graduates of these schools can work in industry, agriculture and commerce. In 1957 it was decided to transform the vocational secondary school from a school offering a terminal course to one whose graduates could enter the university faculties of agriculture, commerce, engineering, etc. This not only enables pupils to continue their studies up to university level in technical or academic subjects, with the possibility of changing from one to the other half-way through, but at the same time provides training for skilled workers within one and the same system. In fact, the trend towards industrial development, the freeing of the national economy from foreign influence and the need for efficient man-power in industry, commerce and agriculture have influenced the authorities to reorganize the vocational school so that it will be even more attractive to students and parents.

There has always been a demand for the expansion of higher education in Egypt, partly because of the prestige traditionally attached to higher education, but also because of the growing need for leaders in industry, commerce, law, medicine, agriculture, education and in other fields of life. At present there are five modern universities—Cairo, Ain Shams, Alexandria, Assiūt and Damascus—and a sixth is being established at Aleppo. In addition, there are higher schools and colleges of several kinds which absorb hundreds of young people and train them for various professions.

The classical University of al-Azhar has been in existence for more than a thousand years. It receives its students not only from the two Regions of the Republic, but from all parts of the Islamic world. It has its own system of primary and secondary schools parallel to the general education system.

The secondary school year lasts approximately 210 days and is divided into three terms. There is a mid-year vacation of two weeks at the end of January and the beginning of February, and a summer vacation from the last week in May to the second week in September. Holidays are observed for certains events of national importance and for religious festivals. The school day of five hours is divided into six periods and pupils attend school for six days a week (Saturday to Thursday).

General secondary schools

Pupils are admitted to the secondary school proper (senior high school) on the basis of their marks in the final examination of the preparatory stage.

Subjects taught in the first year are Arabic, religion, two foreign languages in the Region of Egypt and one in the Region of Syria, natural science, history, geography, social studies, physics, chemistry, drawing, hobbies, physical training and art. In the second and third years the subjects are, for the literary section, Arabic, religion, sociology, philosophy, history, geography, two foreign languages, physical training, hobbies; and for the scientific section, Arabic, religion, two foreign languages, mathematics,

physics, chemistry, biology, hobbies, physical training. Nearly three-quarters of all secondary students are in the scientific sections.

Tests are held at the end of each term. The average mark obtained in the first two tests counts for 25 per cent of the total marks for the year, the marks in the last term test representing 75 per cent of the total. At the end of the third year a public examination is held.

Teachers in secondary schools are university graduates (in either arts or science, with a diploma in education) or have completed a course at a higher training college. They usually begin teaching in junior high (preparatory) schools before they are promoted to senior high schools (secondary).

Vocational and technical schools

Industrial schools. Pupils completing primary education and intending to enrol at an industrial preparatory school are required to sit for an entrance examination.

The courses of study in the industrial preparatory schools are Arabic, religion, history, geography, one foreign language, civics, natural sciences, mathematics, geometry, technology, workshop practice, geometrical drawing, technical drawing.

In the industrial secondary schools the students take Arabic, civics, social studies, physics, mathematics, book-keeping, geometrical drawing, mechanical drawing, mechanics, estimations, technology, decoration, drawing

In the first year each student is trained in the following fields: fitting, metal-turning, smithing, carpentry and joinery, masonry, weaving and spinning. In the second year he specializes in one of the following sections: general mechanical work, auto mechanics, electricity, masonry, weaving and spinning.

The graduates of industrial secondary schools may work in the factories as foremen and technicians or enter the Higher Teacher Training Institute for technical school teachers.

Agricultural schools. The courses of study in the three-year preparatory school are Arabic, religion, agriculture, horticulture, animal husbandry, agricultural industries, rural sociology, bee-keeping and silkworm breeding. Students also receive practical training in dairies and on farms—every preparatory school has a farm of not less than 25 acres. In Syria the agricultural schools have now been replaced by training centres.

In the agricultural secondary schools students are trained so as to be able to run agricultural projects and farms, to initiate their own agricultural enterprises or to work as agricultural advisers, while the best students can go on to agricultural colleges and faculties. Over the period of three years the following subjects are studied: Arabic, religion, agriculture, horticulture, husbandry, biology, physics, chemistry, zoology, food industries, bee-keeping and silkworm breeding, rural surveying, rural economy, social studies, co-operative and farm administration. A farm of about 75 acres is attached to each agricultural secondary school.

Commercial schools. To be admitted to commercial preparatory schools, a student must pass an entrance examination. Courses of study can be grouped thus: (a) Arabic, religion, a foreign language, handwriting, geography, history, and physical training; (b) book-keeping, commercial arithmetic, business training, principles of buying and selling, and typewriting. About 40 per cent of the time is devoted to the second group of subjects. Graduates of this 3-year course are trained to work in small firms.

Commercial secondary schools choose their students from among the graduates of general preparatory schools (70 per cent) and the best students of the commercial preparatory schools. The subjects taught during the three years are Arabic, religion, two foreign languages, economic history, social studies, economic geography, financial and economic mathematics, book-keeping, business training, typewriting, physical education and hygiene. The graduates of these schools can run their own businesses or get office jobs in private firms or in the government service. The best students can go on to more advanced study in colleges or faculties of commerce.

Technical secondary schools for girls. Some girls graduating from the general preparatory schools enter technical secondary schools for girls. The courses of study in the first year are Arabic, religion, a foreign language, history, geography, social studies, natural sciences, hygiene and nursing, needlework, home economics (including horticulture), music and physical training.

In the second and third years each girl specializes in three of the following subjects: home economics (including horticulture), needlework, arts and crafts, music, a second foreign language.

Teacher training schools

General and rural teacher training schools. These schools train primary school teachers for urban and rural schools respectively. Both types accept graduates of general preparatory schools after an interview. They offer a 3-year syllabus of Arabic, religion, English, mathematics, natural science, geography, history, social studies, school hygiene, drawing, handicrafts, physical education, music, needlework (for girls), education and psychology. In the rural schools considerable emphasis is also placed on agriculture. The tendency now is towards extending the course in these schools to 4 years or even 5.

Secondary schools of music. These train teachers of music for primary schools. The students are selected from among the graduates of preparatory schools. Graduates may go into the teaching profession or continue their studies at the Higher Institute of Music.

Secondary schools for physical education. These schools train teachers of physical education for primary schools. Entrants must pass medical examinations, physical ability tests and interviews. The 3-year course covers military training, physical training, games, athletics, swimming, camping and scouting, practical training in teaching, Arabic, religion, principles of education and psychology, social work, hygiene and first aid, anatomy, physiology, physical education (theories and methods), art, music and songs.

Other specialized schools

These include: (a) a polytechnical secondary school with a syllabus that is a well-balanced combination of subjects taught in the three types of technical secondary school (industrial, commercial and agricultural); (b) a secondary school for the gifted with an enriched syllabus; (c) model and experimental schools supervised by the Faculty of Education and the Educational Adviser of the Ministry of Education; (d) secondary schools of nursing, usually attached to big hospitals; (e) midwifery schools.

Out-of-class activities

Social life is considered as an integral part of the educational process in schools. A class council, elected democratically, participates in administering the affairs of each class. In all schools students are grouped into 'houses', each of which also has its elected council. The house councils elect a students' council which takes part in the planning of extra-curricular activities and in the administration of school affairs. With the help of teachers, students organize cultural, technical and social clubs, to satisfy and develop their interests in different disciplines and hobbies. Through these different bodies, students develop a sense of responsibility and a spirit of co-operation which are necessary elements of the new society. Scouting and camping are considered valuable means of contributing to the growth of character and physical development of students.

TRENDS AND PROBLEMS

The development of general and vocational secondary education reflects the democratic, technical and national trends that are shaping modern Arab society, in the sense that secondary education is preparing youth both for life in society and for higher education. More emphasis is being laid upon the practical side in general secondary education, and certain vocational subjects are being introduced, as an experiment, in some of these schools. On the other hand, more emphasis is being placed on academic courses in vocational schools. More practical training is also being given. Technical schools are provided with modern equipment and machines to help students develop the skills required for new industries. Vocational schools have strengthened their relations with factories and production centres. Vocational training centres for boys who are not enrolled at universities have been re-established.

Educational planning in the field of secondary education goes hand in hand with economic planning. Thus technical and vocational education is gaining the respect and the interest of both parents and authorities. An effort is now being made to raise the standard of teaching in vocational schools, and training is provided for teachers in special higher training schools.

Closer attention is being paid to the quality of education by revising curricula, developing new methods of teaching, improving audio-visual aids, establishing higher standards and qualifications for teaching staffs and providing in-service programmes for both teachers and administrators. There is growing interest in vocational guidance and counselling as means of ensuring the all-round development of secondary school students. The examination system is being revised and simplified. New evaluation techniques such as aptitude tests, interest tests, and cumulative records are being developed.

Education for girls is being expanded and diversified. Besides the general secondary schools and the schools in which girls are taught home economics and child care, new vocational schools for girls have been established. Girls are now finding employment in factories and business firms.

In view of the increasing number of international contacts in modern society, more foreign languages are being taught at secondary level.

The relation between secondary school and community is being strengthened. The school feels more responsible for contributing to the improvement of the social, cultural and economic awareness of the community. In return, the resources of the community are used by both teachers and students to infuse vitality into the processes of education.

STATISTICS: REGION OF EGYPT

Population (mid-year 1958 estimate):[1] 24,781,000.
Area: 386,100 square miles; 1,000,000 square kilometres.
Population density: 64 per square mile; 25 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, total enrolment (not including al-Azhar University and some 90,000 persons attending adult education courses) reached nearly 2.7 million, being 11 per cent of the total population in the Region of Egypt. Of these pupils, 78 per cent were in primary education, 15 per cent in general secondary education, 2 per cent in vocational education, 1 per cent in teacher training, and 3 per cent in universities and higher institutes (other than al-Azhar). The proportion of girls was 36 per cent in primary schools and sections, 23 per cent in general preparatory (i.e. lower secondary) and secondary schools and sections, 21 per cent in vocational education, and 45 per cent in teacher training schools and sections. In the higher teacher training institutes 38 per cent of the students were girls, and in the other institutions of higher education, 13 per cent. Women teachers represented 33 per cent of the teaching staff in primary schools and sections, and 18 per cent in the preparatory and secondary schools and sections. Average number of pupils per teacher was 38 in primary schools and 16 in all the preparatory and secondary schools and sections combined.

Between 1953 and 1957, enrolment increased by 50 per cent in primary education. At the secondary level, only vocational schools and sections had increased enrolment (nearly threefold), but this sector accounted in 1957 for only 13 per cent of the total secondary enrolment. However, the proportion of girls in general secondary education had increased from 19 per cent in 1953 to nearly 23 per cent in 1957. Higher education enrolment increased by 46 per cent. (See Table 1.)

Enrolment trends in secondary education, 1930–57. From 1930 to 1952 there was a nine-fold increase in general secondary enrolments (the proportion of girls rising from 6 to 16 per cent), and a three-fold increase in vocational education and teacher training. The sudden expansion in general secondary school enrolment between 1952 and 1953 was due to a reorganization of the school system, as a result of which secondary education comprised a 4-year lower secondary and a 3-year upper secondary course. Another change in 1956 reduced the lower secondary stage to a 3-year preparatory course, while increasing the duration of primary schooling from 4 to 6 years. Vocational education has seen a rapid expansion within the last five years. Average total enrolment at the secondary level now takes in about 21 per cent of the estimated population 15–19 years old. (See Table 2.)

Examination results in secondary education, 1953–57. The number of general secondary education certificates more than doubled between 1953 and 1957, while the total number of vocational diplomas awarded increased by 29 per cent. Certificates of teacher training schools showed the highest rate of increase, the total number granted in 1957 being 4.5 times as large as in 1953. The proportion of girls receiving elementary teachers' certificates decreased from 61 per cent in 1953 to 41 per cent in 1957. For the first time in 1957, girls also received certificates as rural school teachers, while boys began to receive advanced primary teachers' certificates. (See Table 3.)

Educational finance, 1958/59. In the fiscal year beginning in July 1958, total expenditure by the Ministry of Education was budgeted at 39,326,000 Egyptian pounds, representing an average expenditure of £1.6 per inhabitant. Of this sum, £23,585,000 was for salaries to teachers and other professional staff, £11,741,000 for other recurring expenditure, and £4,000,000 for 'new projects'. These figures do not include expenditure for education by other Ministries, by provincial and municipal authorities (for primary education) nor expenditure from the university budgets, nor for adult education. Official exchange rate: 1 Egyptian pound = 2.87 U.S. dollars.

STATISTICS: REGION OF SYRIA

Population (mid-year 1958 estimate):[1] 4,280,000.
Area: 71,228 square miles; 184,479 square kilometres.
Population density: 60 per square mile; 23 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, total enrolment (excluding vocational schools not under the Ministry of Education and students in part-time schools of adult education) was over 456,000, representing 11 per cent of the total population. Of these pupils, 6 per cent were in kindergarten classes, about 79 per cent in primary schools, 13 per cent in secondary education, and nearly 2 per cent in higher education. The proportion of girls was 29 per cent in primary schools, 23 per cent in secondary schools, 26 per cent in vocational and commercial schools, 36 per cent in teacher training schools, and 17 per cent at the University of Syria. Women were 38 per cent of all teachers in primary schools (including kindergarten classes), where the pupil-teacher ratio was 33. In secondary schools, the average number of pupils per teacher was 19.

Between 1953 and 1957 enrolment increased by 21 per cent in primary schools, by 36 per cent in vocational and commercial schools, and more than doubled at the university. However, in the general secondary schools, there was a sudden drop in enrolment between 1956 and 1957, resulting in a figure for 1957 which was barely 1.5 per cent above that for 1953. A similar trend is noted with regard to vocational and commercial schools, where total enrolment increased progressively between 1953 and 1956 but showed a decrease in 1957 over 1956. (See Table 2.)

Enrolment trends in secondary education, 1930–57. Between 1930 and 1943, enrolment in public general secondary schools more than tripled, with the proportion of girls increasing from 10 to 26 per cent. In the next 14 years, between 1944 and 1957, secondary school enrolment in public and private schools together went up almost five times, but the proportion of girls had diminished rather than increased. In spite of an apparent setback in the 1945–49 period, vocational school enrolment (in which private schools play a minor part) had also shown steady increase, particularly on the part of boys. Enrolment in teacher training schools showed a definite trend towards increase between the years 1944 and 1954. From Table 3 it may be seen that the average total enrolment at the secondary level, for the period 1955–57, reached about 17 per cent of the estimated population 15–19 years old.

Examination results in secondary education, 1953–57. The number of general secondary education certificates (*brevets*) granted in 1957 was half as many again as in 1953, while the number of *baccalauréats* nearly tripled over the same period; the proportion of girls among the successful candidates in 1957 was only 21 per cent for the *brevet* and 17 per cent for the *baccalauréat*. Similarly, girls received 31 per cent of the *brevets* in industrial education, but only 21 per cent of the *baccalaureats*. In commercial education, the *brevet*, apparently received only by boys, seems to have disappeared in favour of an increasing number of *baccalauréats* in the same field. In 1957, girls received 37 per cent of teacher training diplomas, whose number had increased by 26 per cent since 1953. (See Table 4.)

Educational finance, 1958/59. For the fiscal year beginning in July 1958, total recurring expenditure for education was budgeted at 65.5 million Syrian pounds, being an average of £15 per inhabitant. (See Table 1.)

1. In the previous edition, enrolment in pre-primary education—except at foreign schools—was counted with enrolment in primary education.
2. Teachers in primary schools also teach in the kindergarten classes attached to these schools.
3. Not including rural public schools.
4. Including teachers of teacher training schools.
5. Only schools under the Ministry of Education.
6. Included in general secondary education.
7. Including teacher training at the university.

THE EDUCATIONAL SYSTEM

Various influences, some governmental, some non-governmental, combine to produce the pattern of education in England and Wales. The main feature of the pattern is the public system of primary and secondary education. This system is mainly concerned with the children of compulsory school age, that is between 5 and 15 years, but it projects upwards to a considerable extent to include children up to the age of 18 or beyond who are preparing for the various forms of higher education and downwards to include nursery schools for children aged 2 to 5. The universities, which are independent of government control though they receive very substantial financial assistance from the State in various ways, the publicly-maintained technical colleges and colleges for training teachers, and the educational facilities of the armed services also form part of the general pattern. To complete the picture, mention must be made of the private or independent schools and colleges which supplement the state provision. In England and Wales, there are close on 7 million children in some 30,000 schools maintained or assisted out of public funds—a large proportion of these are in schools built since the end of the second world war. Another half million children are in some 4,400 independent schools i.e. unaided private schools, varying from the large and well-known so-called 'public' schools to small local institutions catering for a very small number of children.

The statutory basis of the system is the Education Act of 1944 which gave legal recognition to the principle that it is the responsibility of the State to provide every child with the opportunity to develop his capabilities and aptitudes to the full, spiritually, morally, mentally and physically, regardless of his parents' means or station in life. The system allows no discrimination on grounds of sex, race, colour or creed but it acknowledges the rights of parents regarding denominational religious instruction and the interest of the churches in education, the differing needs of boys and girls and the particular ethnic and linguistic problems of the Principality of Wales.

The Education Act of 1944 provides for the education of the child in three progressive stages—primary education from the age of 5 to 11+, secondary education from the age of 11+ to 15 (minimum school leaving age) or up to 18 or 19 where appropriate, and further education after full-time schooling is done with.

The structure of the school system is shown in the diagram on page 1159.

Central government. With the exception of university education, education in England and Wales is under the control of the Minister of Education. The Minister's duty is 'to promote the education of the people of England and Wales and the progressive development of institutions devoted to that purpose, and to secure the effective execution by local authorities, under his control and direction, of the national policy for providing a varied and comprehensive educational service in every area'. (Section 1(1), Education Act, 1944.)

The Ministry does not conduct any schools itself. Its functions include the following: (a) the determination of major policies; (b) control of the rate, distribution and nature of education building; (c) control of teacher training and supply and determination of the principles governing recognition of teachers as duly qualified for their profession; (d) the settlement of disputes, for example, between a parent and a local education authority, or between a local education authority and the managers or governors of a school; (e) the payment of certain educational grants from central government funds, for example, scholarships, educational research. Two Central Advisory Councils, one for England and the other for Wales, advise the Minister upon any questions referred to them by him.

Local government. Local administration is in the hands of the elected councils of counties and the larger cities (known as county boroughs). These local authorities have many public duties delegated to them by Acts of Parliament. Among these duties is the responsibility for education. The local authorities, in the context of education, are known as local education authorities. As regards primary and secondary education the duty of the local education authorities is laid down in Section 8(1) of the Education Act for 1944 as follows: 'It shall be the duty of every local education authority to secure that there shall be available for their area sufficient schools (a) for providing primary education, that is to say, full-time education suitable to the requirements of junior pupils; and (b) for providing secondary education, that is to say full-time education suitable to the requirements of senior pupils, other than such full-time education as may be provided for senior pupils in pursuance of a scheme made under the provisions of this Act relating to further education; and the schools available for an area shall not be deemed to be sufficient unless they are sufficient in number, character, and equipment to afford for all pupils opportunities for education offering such variety of instruction and training as may be desirable in view of their different ages, abilities, and aptitudes, and of the different periods for which they may be expected to remain at school, including practical instruction and training appropriate to their respective needs.'

Accordingly the local education authorities build schools and colleges, pay teachers, provide materials, equipment, etc.

Private agencies. The churches—the established Church of England, the Roman Catholic Church and the nonconformist Protestant denominations—play a significant part within the publicly-financed educational system in the provision of denominational schools. Popular education in

England and Wales owes its origin to the early initiative of the religious bodies and their interest is perpetuated today in what is known as the 'dual system' whereby, although all schools within the public system are maintained out of public funds, in some cases, the actual building is provided by the local education authority and in others by the church concerned; the former are known as 'county schools' and the latter as 'voluntary schools'.

In addition to the county and voluntary schools, there are a number of schools which are either partly assisted by public funds (see glossary under 'direct grant schools') or wholly independent financially. All are subject to a measure of control by the Minister as described later.

THE DEVELOPMENT OF SECONDARY EDUCATION

Some of the oldest secondary schools trace their history back over several centuries but the nineteenth century saw a widening of secondary education both qualitatively and quantitatively. This movement was at first limited to the independent schools, State interest in popular education being confined at that time to elementary education. The Education Act of 1902 introduced striking reforms in the public education system. At that time, the term 'secondary education' meant education of an academic character as distinct from the simpler and more practical elementary education. Under that Act, remodelled local education

GLOSSARY

NOTE. Apart from the highest classes (sixth form) in the grammar schools, the chart does not indicate the designation or numbering of classes as practice in this respect is not uniform.

bilateral school: a secondary school providing clearly defined and separate courses for two of the following kinds of secondary education—grammar, modern, technical. (See *secondary grammar school*, *secondary modern school*, *secondary technical school.*)

comprehensive school: a large secondary school combining grammar, modern and technical education. (See *secondary grammar school*, *secondary modern school* and *secondary technical school.*)

direct grant school: the premises are owned by an independent non-profit making body who are responsible entirely for the conduct and finance of the school, but the Ministry gives grants directly to the school, based on the number of pupils. Fees may be charged but the amount is subject to the approval of the Ministry; a number of free places must be reserved for children from maintained primary schools. They are usually grammar schools but there are some nursery and technical schools.

evening institute: evening classes are held either in evening institutes or as part of the activities of technical colleges (see below) and provide the widest possible variety of courses for persons of all ages who have left school. Tuition ranges from preparation for the General Certificate of Education and external degrees of London University through vocational, technical and commercial courses and liberal humanistic studies to recreational subjects such as dancing.

General Certificate of Education: the main external examination for secondary school pupils in England and Wales.

independent school: the premises are held, and the school conducted by a proprietor or other profit-making body or by a non-profit-making or charitable body. No grant is received from public money but such schools are open to inspection by the Ministry. The schools commonly known as 'public schools' are for the most part independent schools.

nursery class: a class for children of about 3 to 5 years attached to an infant school or department.

nursery school: a self-contained school for children between the ages of 2 and 5 years, that is, under compulsory school age.

primary school: a school providing separate primary education for children aged 5 to 11 years; may be for 'infants' only (5 up to 7), for 'juniors' only (7 to 11) or for both.

school of art: an establishment similar in character to the technical college, but providing courses in all forms of pictorial and plastic art, including industrial design and also courses leading to the Ministry's diplomas and certificates for art teachers.

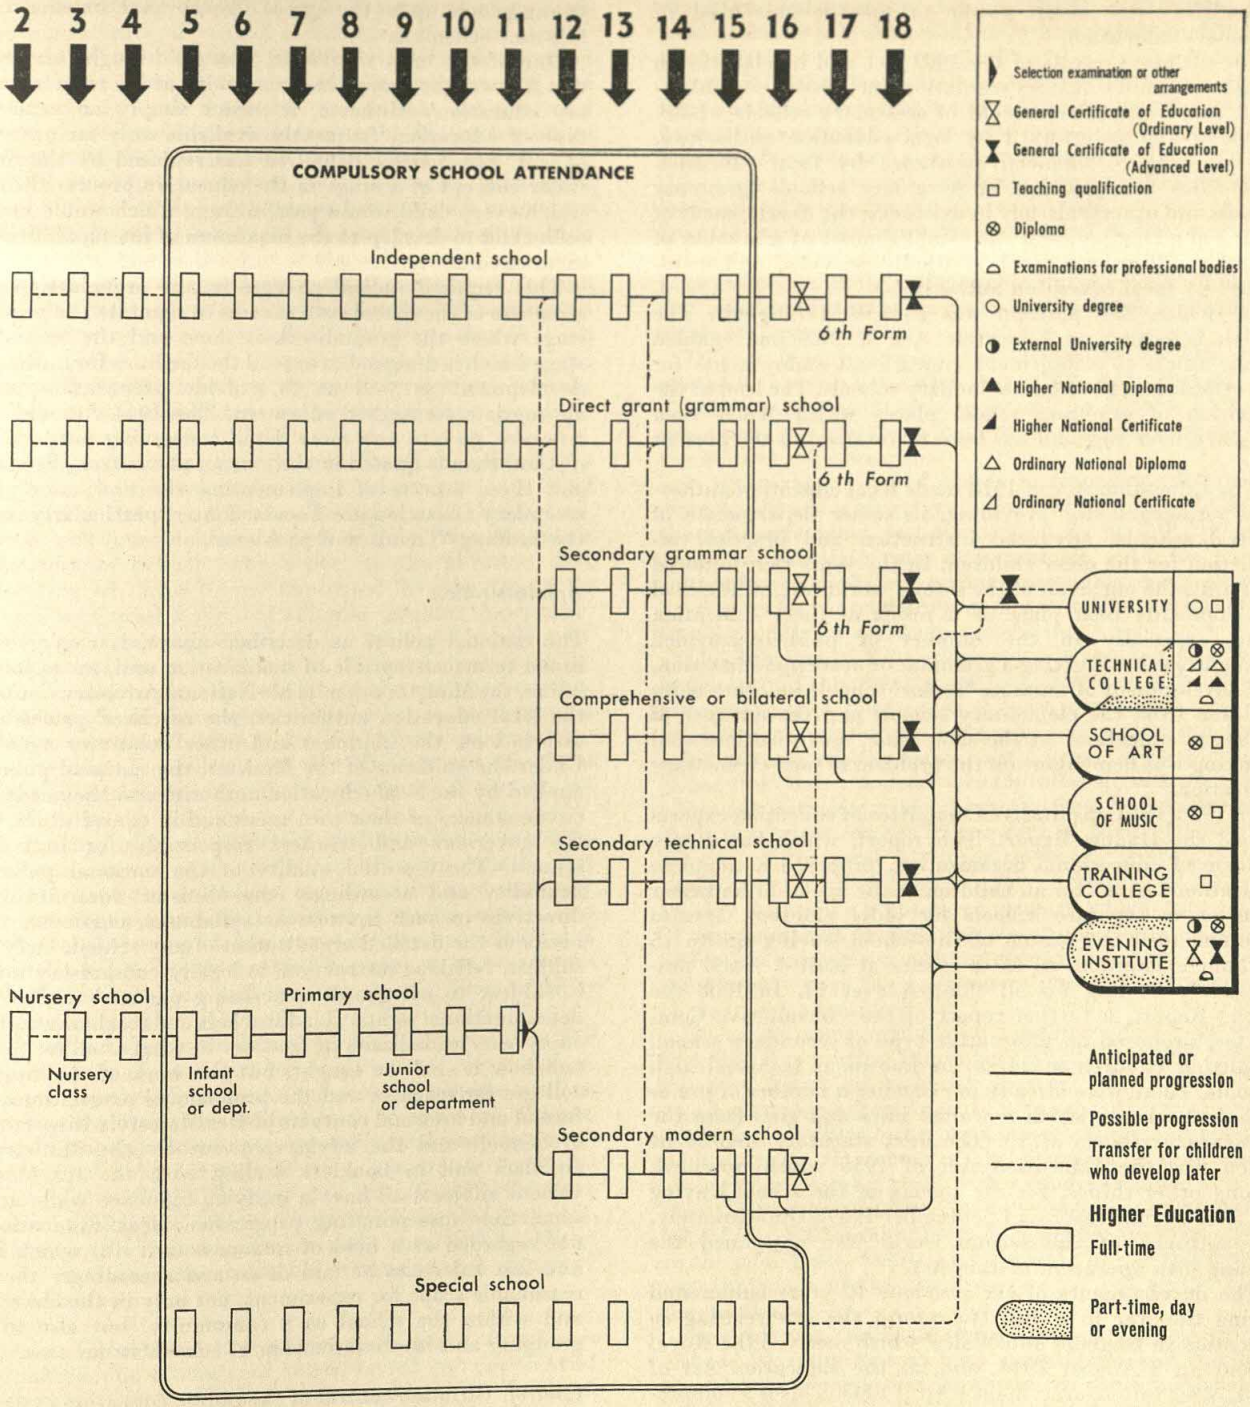
school of music: normally provides full-time courses for students who have left school and wish to train either as professional musical performers or as specialist teachers of music in schools.

secondary grammar school: provides an academic, liberal education in a course planned to lead to university education.

secondary modern school: provides general education with a practical bias influenced by local circumstances and environment.

secondary technical school: provides a course of general education with a technical bias.

selection examination commonly known as 'the 11+ examination': objective tests of reading, writing, arithmetic and intelligence, taken by all primary school children at about 11 years of age to indicate the kind of secondary education best suited to them; open also to children in private schools but not compulsory for them. A number of education authorities are experimenting with other methods of selection.



sixth form: the highest classes of the grammar-type schools, usually tending to specialize either in the arts or the sciences, and planned as direct preparation for university entrance.

special school: school for physically or mentally handicapped children with compulsory attendance to the age of 16. Courses provide, to the extent that the disability will allow, an education similar to that provided in primary and secondary schools for normal children.

technical college: an establishment providing scientific, technical and commercial education as distinct from industrial training for persons who have finished their compulsory education in a school. Courses may be full-time or part-time during the day or in the evening. At the highest level, technical colleges provide technological education parallel with universities.

training college: an establishment providing education and professional training for teachers.

universities: are in no way under the control either of the Ministry of Education or other Government Department. They are self-governing institutions but receive grants from the State through the agency of the University Grants Committee, a body of persons experienced in university administration and education.

authorities were given power to provide this kind of secondary education.

The ultimate results of the 1902 Act and its elaboration in later acts and statutory regulations included the establishment and rapid development of secondary schools wholly provided and maintained by local education authorities, the granting of financial assistance by local education authorities to a number of secondary schools (grammar schools and others) already in existence, the development of technical education, and the establishment of a number of training colleges for teachers wholly provided and maintained by local education authorities.

In Wales, the position was somewhat different. The Welsh Intermediate Education Act of 1889 had enabled public funds to supplement educational endowments for the establishment of new secondary schools. The lead in the provision of grammar school places which Wales then obtained over England has been maintained to the present day.

The Education Act of 1918 made local education authorities responsible for providing, in senior departments of central schools, advanced instruction and practical instruction for the older children. In the years that followed and until the outbreak of the second world war, widespread developments took place as a result of these Education Acts, especially in the number of publicly-provided secondary schools giving a grammar or academic education, the development of separate 'senior' schools for other older children from the elementary schools and the advance of technical education. At the same time, much fundamental thinking was being done on the problem of post-elementary education.

In 1926, the Consultative Committee of education experts issued the Hadow Report. This report, which has deeply influenced educational organization, proposed a complete educational break for all children at the age of 11 and their transfer to separate schools for older children. It also recommended the raising of the school leaving age to 15 without exemption, so as to ensure at least 4 years' progressive schooling for all children over 11. In 1938 the Spens Report, a further report of the Consultative Committee, proposed an alternative type of secondary school, admitting children at 11, to be known as technical high schools. There were already in existence a number of junior technical schools which recruited boys and girls from the elementary schools at 13. The next statutory step to be taken was the Education Act of 1936 which provided, among other things, for the raising of the school leaving age from 14 to 15 (as from 1 September 1939). Unfortunately, the outbreak of the second world war postponed the coming into operation of this Act.

The developments of the previous 40 years culminated during the war in a Bill 'to reform the law relating to education in England and Wales' which received the Royal Assent on 3 August 1944, and, as the Education Act of 1944, came into operation on 1 April 1945. This is a comprehensive Act; in addition to many changes which took place immediately or subsequently, it provides for certain reforms which have yet to come into effect, namely the raising of the minimum school leaving age to 16 and the introduction of 'county colleges', i.e. establishments for continuing the general education, on a part-time basis, of young people up to the age of 18 who have finished their full-time schooling.

One of the most significant changes brought about by this Act was the change in the meaning of the term 'secondary education'. Hitherto, it meant simply an academic type of education, frequently available only on payment of fees. This narrow definition was replaced by the much wider concept of a stage in the educative process through which every child would pass, a stage which would enable each child to develop to the maximum of his capabilities as mentioned above.

This required radical changes in the organization and structure of the school system so as to separate the primary stage where the groundwork is done and the secondary stage which is designed to extend the facilities for individual development as well as to provide preparation where appropriate for higher education. The 1944 Act did not, however, go into any more detail concerning purpose and method than is quoted in the extract above from Section 8 and these aspects of implementing the new concept of secondary education are discussed later, particularly under the heading 'Trends and problems'.

Administration

The national policy, as described above, is conceived in broad terms susceptible of modification and, in its formulation, the Minister consults his National Advisory Councils, the local education authorities, the teachers' professional associations, the Churches and other voluntary agencies. Under the guidance of the Minister, the national policy is applied by the local education authorities to the needs and circumstances of their own areas and in consultation with the governors and teachers responsible for individual schools. The essential quality of the national policy is flexibility and accordingly the Minister does not issue directives in such matters as syllabuses, curricula, textbooks or the detailed organization of any school. Only one subject, religious instruction, is legally compulsory and it is subject to safeguards concerning parents' wishes and denominational rights. Head teachers and teachers generally enjoy very wide limits of freedom in what shall be taught and how it shall be taught, but the work of the training colleges for teachers and the professional associations, the formal and informal contacts of Her Majesty's Inspectorate of Schools and the advice put out by the Ministry in circulars and in booklets dealing with the teaching of various subjects all have a unifying influence while at the same time disseminating progressive ideas. Education is not regarded as a field of human activity in which hard and fast rules can be laid down and accordingly there is reasonable scope for experiment, not only in the classroom and within the school as a community, but also in the grouping and interrelationship of schools in an area.

Control. Ultimate control of the public education system is vested in the Minister and, under the Education Act of 1944, local education authorities submit for his approval their plans for the development of primary and secondary education in their areas. Although the Minister can apply sanctions against a local education authority which, in his view, is not fulfilling its statutory duties, it is only on very

rare occasions indeed that these powers have to be invoked. Administration and control is effectively carried out by co-operation, compromise and mutual understanding between the Central Government Department and the bodies, official and otherwise, responsible for the local operation of the system. This fact is the salient feature of educational administration in England and Wales.

While the Minister and the local education authorities exercise responsibility in their own spheres, each secondary school has a body of governors, who are persons of standing interested in the well-being of the school and who have certain statutory duties. Articles of government of a school define the functions to be exercised by the local education authority, the governors and the head teacher in such matters as the appointment and dismissal of teaching and other staff, holidays and, in the case of voluntary schools, the provision and maintenance of the buildings.

Supervision and inspection. Supervision of the schools is a matter in the first place for the head teachers, the local education authorities and the school governors. Inspection, formal and informal, is carried out by Her Majesty's Inspectors of Schools who report to the Minister. HM Inspectors of Schools are appointed by the Queen in Council and must have had suitable teaching experience. Their duties are organized so as to provide adequate inspection of the schools and at the same time to make available their expert knowledge of the various branches of learning and wide experience of what is happening in different schools. Thus, they are able to give expert advice on educational problems to the Minister, to the local education authorities and to the governors of the schools as well as to the teachers.

A number of local education authorities also maintain their own inspectorates (restricted of course, unlike HM Inspectors, to the schools of one authority and normally more closely associated with matters of administration) and employ organizers and advisers, who are specialists in a particular subject with teaching experience, to be responsible for advising on and guiding the teaching of their subject in a number of schools.

All independent schools are open to inspection by the Minister and about a quarter of them are 'recognized as efficient' by the Minister. As independent schools are free to apply or not for this limited form of approval, absence of such recognition does not necessarily imply any comment on a school. All independent schools must, however, be 'registered' with the Ministry and it is illegal to conduct a school which has not been registered. In this way, the Ministry is able to ensure that seriously unsuitable buildings are not used and that unsuitable persons are not employed on the staff.

Finance. Educational expenditure in England and Wales is financed out of national taxes, levied by the Central Government, from which a grant is made to the local authorities in respect of the services for which they are statutorily responsible, and out of local rates, related to the value of land and buildings and levied by the local authorities. The greater part of educational expenditure is incurred directly by the local authorities and although the assistance from central government funds is considerable, education represents by far the largest single item in a local authority's budget and the largest charge on the local taxes.

For all 'maintained' schools, whether county or voluntary, the local education authority is responsible for all the costs of running the school—the salaries of teaching and other staff, books and stationery, heating, lighting, etc. In the case of county and voluntary controlled schools, the local education authority is responsible for the cost of erection and upkeep of the building. In the case of a voluntary aided school, the voluntary governors are responsible for the erection and external maintenance of the building but they may receive a grant from public funds of 75 per cent of the cost.

Tuition fees in maintained secondary schools were abolished by the Education Act, 1944, but they are still payable in independent schools and in certain grammar schools (about 180) receiving a *per capita* grant direct from the Ministry of Education.

If an authority takes up an independent day school place because of a shortage of places in maintained schools, the authority must pay the tuition fee in full. In other cases, an authority may assist parents with the cost of tuition fees to the extent needed to avoid hardship, but this is a matter for the authority, and parents have no guarantee that a request for assistance will be met.

The Ministry of Education controls the fees chargeable in the case of the direct grant schools and such schools are required to offer 25 per cent of their places each year, free of charge, to pupils who have previously attended grant-aided primary schools for at least 2 years. These places are called free places and are usually offered through a local education authority which pays the fees. School governors must also put a further 25 per cent of their places at the disposal of the local education authority if required, but candidates for these places (reserved places) do not need to have attended a grant-aided primary school. The parents of day pupils not holding free places can claim a remission of fees in accordance with an approved income scale and the Ministry pays the governors of the school the amount of the fees so remitted.

There are some maintained boarding schools at which boarding fees ranging from about £120 to £200 a year are payable. Where an authority provides board and lodging at a maintained school because it cannot otherwise provide education suitable to the pupil's age, ability and aptitude, it must remit the whole of the boarding fees. Where an authority provides a pupil with a boarding place in a non-maintained school because, owing to shortage of maintained school places, it cannot otherwise provide education suitable to the pupil's age, ability and aptitude, the authority must pay the whole of the boarding fees as well as the tuition fees as above.

In other cases an authority may assist parents with the cost of boarding fees at both maintained and non-maintained schools to the extent needed to avoid hardship, but here again this is a matter for the authority to decide.

Local education authorities may provide clothing for any child at a maintained or independent school if they consider the child to be so poorly clothed that he cannot benefit fully from his schooling. The authority must recover the cost from the parent if they think that this can be done

without hardship. School uniforms may also be provided in cases of need. Authorities are further empowered to award maintenance allowances for pupils over compulsory school age staying on at school for full-time education. The allowance is assessed in accordance with an income scale drawn up by the authority.

Buildings and equipment. The educational reforms envisaged in the Education Act of 1944, an abnormally high birthrate in the years immediately following the end of the war, the destruction of schools during the war, the creation of new towns and the drift of population away from old centres, all combined to present an immense problem of providing sufficient school buildings. After the war, priority was given to the allocation of the country's national building resources to housing, education and industry. Over 1,500 new secondary schools together with improvements and additions at a total cost of £250,000,000 have been built between the end of the war and 1959 and this progress continues.

The size of the educational building problem presented a challenge and an opportunity. New ideas and methods were introduced in the design and construction of schools, taking account of such varied factors as educational principles and practices, constructional techniques, speed in erection and durability of the product and the necessity of getting the maximum amount of buildings for the resources available. Great advances have now been made in developing buildings which are good both architecturally and educationally and the results of this research and development by the Ministry and the local education authorities is made generally available by means of special publications, conferences and constant consultations.

In accordance with the liberal tradition of educational administration, the Ministry's Building Regulations set minimum standards of a simple and flexible kind governing the accommodation and construction required for various types of school, while the costs of schools are controlled by a simple system of 'costs per place'; at present this is £264 for secondary schools. In accordance with the standards of the Building Regulations and for the total figure calculated on the basis of this cost per place multiplied by the number of places a school is planned to provide, good schools designed in the light of detailed educational requirements as well as architectural and constructional techniques can be built economically.

In line with the development of the buildings themselves, much thought and research has been devoted to the question of equipment of all kinds, including writing tables and desks, chairs, washbasins, and other sanitary equipment all designed in relation to the needs of the children who will use them. These studies have of course not been confined to the classrooms or practical instruction rooms but have also included the kitchens, common rooms and other such places in the schools.

Overall national planning is done by means of annual building programmes. Local education authorities submit their proposals for new schools and for extensions and additions to old schools to the Ministry, and a national plan is then drawn up after which local education authorities are notified of the Minister's approval or modification of their proposals. This is done in sufficient time to enable the forward planning by architects and others in conjunction with educational experts to take place so that the schools may eventually be provided at the time when they are needed.

School welfare services. Local education authorities must make available free medical inspection and treatment and provide a school dental service for the children attending maintained schools in their areas. While treatment can be and is provided directly by authorities through the school health service, much treatment of a specialized nature is arranged through the National Health Service. The aim of the school health service is to prevent and check disease or defects and to secure early treatment. Its principal weapon is regular medical and dental inspection. Except where the Minister has agreed to special arrangements, local education authorities must provide for the general medical inspection of all pupils in schools maintained by them on at least three occasions at appropriate intervals during the period of compulsory school age. More frequent inspection is made of children whose condition makes it necessary. Many authorities provide child guidance clinics for children with psychological difficulties. Speech therapy is an important part of school health provision; as it is closely linked with the work of the school it is usually provided by the local education authority and not by the National Health Service.

Every local education authority is required to make milk and meals available to pupils attending maintained schools. At present one third of a pint of milk is provided daily free of charge and about 85 per cent of the children take it. Milk is also available free of charge to pupils at independent schools and about 80 per cent avail themselves of this milk. Most maintained schools now have facilities for school dinners supplied either from a central kitchen or from a special kitchen on the school premises. A charge is made, at present one shilling per meal, but if a parent cannot afford this sum the pupil may receive dinner free or at a reduced rate according to the parents' ability to pay. About 50 per cent of the children in maintained schools take school dinners.

If a pupil has to travel 3 miles or more to the nearest secondary school suitable to his age, ability and aptitude, the local education authority must provide him with free transport to that school. The authority may provide, or assist with the provision of, transport to a school other than the nearest, but is under no obligation to do so. Transport may be in the authority's own vehicles or arrangements may be made for private hire vehicles to be used; where public transport exists an authority may make use of it by paying the children's fares.

TYPES OF SECONDARY EDUCATION

Secondary education in England and Wales is generally of two types (grammar and modern) and is usually provided in separate schools. A third type, secondary technical, exists in some areas. A number of local education authorities have now introduced comprehensive schools, which are generally bigger than the selective schools and provide for all forms of secondary education in a particular locality.

There are also some bilateral schools giving two forms of secondary education. Whereas the primary schools are usually co-educational, about 50 per cent of the secondary schools are single sex.

The local education authorities decide how to determine which form of secondary education will best suit the individual children and this has usually been done by means of a test in the spring of the year in which the children attain the age of 11, reports from the primary school teachers and the wishes of the parents being taken into account as far as practicable. The test has come to be known as the 11 + examination because it affects the form of secondary education the child follows when he is over 11 years of age, and the same test is taken by most of the children in the authority's area who are due for transfer. The form of the examination is usually such as to measure general aptitudes and attainment in arithmetic and in English. Many authorities are, however, experimenting with other methods of selection, often involving much greater reliance on primary school assessment of the children's potentialities together with the results of tests taken over the last year or two.

The school year. The secondary school year, as also does the primary school year, begins in September and continues until late in July. It is divided into 3 'terms' separated by vacations at Christmas and at Easter, each lasting about 3 weeks, and a summer vacation of about 6 weeks. Mid-term is usually marked by a long week-end of 4 or 5 days' duration. The teaching routine is planned in relation to a working week of about 35 lessons of 34–45 minutes in duration.

Out-of-class activities. Life in a secondary school involves a good deal more than attending classes and doing home-work and there is a wide range of extra-curricular activities which encourage membership of clubs and societies of all kinds. In many schools, the pupils are divided into 'houses' and this system encourages individual effort in work and in games, in drama and in other cultural activities, while inter-house matches stimulate an interest in sport among many who could never aspire to representing the school in inter-school events. Responsibility for school discipline is delegated as far as possible to older students who are appointed first as house 'prefects' or monitors and later as school prefects or monitors.

Vocational guidance. Guidance on careers is afforded through the Youth Employment Service, a service offered either by the local education authority or by the Ministry of Labour and National Service to all secondary schools in the area. In some schools a particular master or mistress is, in addition to teaching duties, given the responsibility of advising pupils on suitable careers.

Grammar schools

The curriculum of the average secondary grammar school is progressive from a broad base of general subjects to a comparatively narrow platform of specialized studies in the sixth form in preparation for university entrance at the age of 18. A typical first-year programme would include religious instruction, English, history, geography, French, mathematics, general science, art, music, handicraft or housecraft and physical education; Latin is commonly added in the second year. The first 3 years are regarded largely as diagnostic; in the subsequent years, the students begin to concentrate on those subjects in which they wish to specialize. Much of the work in the grammar school is geared to the General Certificate of Education (GCE). The certificate examination is conducted by 9 examining boards, nearly all of which are connected with universities, and it is a means of entry to university and is accepted as equivalent to the preliminary examinations of many professional bodies. A candidate may offer as many or as few subjects as he wishes and for each subject papers are set at two levels, 'ordinary' taken at a minimum age of 16, and 'advanced', normally taken at 18. Candidates competing for scholarships to universities may attempt certain subjects at 'scholarship' level which is more rigorous than 'advanced'. The certificate examination is open to candidates not at school and may be taken by school candidates younger than 16 years of age at the discretion of the headmaster or headmistress.

A typical grammar school would have about 500 pupils and admit 90 to 100 new pupils annually but there are smaller schools in many rural areas and larger ones in some big cities. The pupils are generally classified by general ability into three 'streams' for work in literary, scientific, cultural and practical subjects and these streams are usually also their 'forms' for general administrative purposes; promotion or demotion from stream to stream would take place in accordance with the pupil's performance. Syllabuses of work reflect the varying accomplishments expected of the several streams. For mathematics and languages the pupils are frequently 're-set' into differently graded classes to allow for the marked differences in aptitude which pupils manifest for mathematics or languages as compared with literary subjects.

For many pupils the GCE examination at ordinary level marks the end of their school career, but the tendency to continue at school in order to spend a year or two in the sixth form has grown steadily of recent years, and the proportion of pupils continuing in this way has now risen to about 40 per cent. The sixth form comprises the group of pupils who remain at school for a further 2 or 3 years, generally with a view to entering universities or training colleges for teachers. Their curriculum is narrowed to about 5 subjects of which the pupil will specialize in 2 or 3, devoting about two-thirds of the working week to them. The choice of subjects tends to divide the sixth form into two sides, the science side and the arts side; about 60 per cent of all sixth-form pupils are currently studying on the science side.

Technical schools

Secondary technical schools are numerically much fewer than grammar schools and cater for only about 5 per cent of the total age group. They represent a development of a type of vocational school which was established in certain industrial areas before the second world war. Recent developments in curriculum planning, however, have brought the work of these schools more into line with the

standards set by the grammar schools. Their individuality of character is marked by a greater emphasis upon practical subjects and commercial skills, and by a certain bias of treatment of other subjects.

About one-half of the technical schools now recruit children at the age of 11, and, with these, the curriculum of the first 2 or 3 years is markedly similar to that of a grammar school. The curriculum is modified with progress through the school to take increasing account of individual abilities and aptitudes. Courses in shorthand and typing are offered and pre-nursing courses are sometimes arranged. The work in practical subjects is stepped up, while in subjects like English, science and mathematics the work is as exacting as in a grammar school. The majority of students who attend secondary technical schools take the GCE at ordinary level, and an increasing proportion are electing to remain at school for a sixth form course, usually in mathematics and science, preparatory to taking the GCE at advanced level.

Modern schools

Secondary modern schools provide the broad general education required by the majority of pupils who leave school at 15. The range of subjects studied is similar to that offered by the selective secondary schools, except that the majority of secondary modern schools do not include a foreign language and that the teaching approach is often different. With pupils of moderate ability, emphasis is placed upon learning through discovery from books and other sources of information, and by paying local visits to farms or factories, to historical buildings and to places of geographical interest. Such subjects as history, geography, science, music, art and craft, handicraft or housecraft, and physical education are generally taught by specialist teachers. English and mathematics are frequently the responsibility of the form teacher, who thereby sees his pupils more frequently than any other member of the staff and gets to know them particularly well.

Initially, pupils who are of average or above average ability follow the same curriculum as those who form the middle group, but more is expected of them, and of recent years there has been a strong trend towards introducing extended courses for these abler pupils who wish to continue at school beyond the age of 15. Some of these extended courses reflect a bias towards technical studies, others are a preparation for the GCE. Such provision has so encouraged the trend towards continuing at school that the numbers staying have increased appreciably over recent years, and during these years the number of entries for GCE from secondary modern schools has increased to two and a half times the earlier total.

Particular attention is paid to those who find learning difficult. The work of these groups is often the responsibility of one teacher who has had special training for or is particularly interested in the problem of teaching slower learners. Reading and writing are given special emphasis, and the work in history, geography and science is often directed towards securing improvement in the use of these basic skills. In arithmetic the aim is frequently confined to imparting the skills in computation that ordinary citizens need in everyday life. Because secondary modern schools draw their pupils from a wider geographical area than primary schools, and cater for a wider range of abilities than other secondary schools, slow learners are more numerous in them than in any primary school. Special attention to their particular needs can accordingly be more readily given, and they are often found to respond so well as to enable them after one or two years to join students who are nearer to the average in ability.

Pupils in secondary modern schools who demonstrate after two or three years that they are more suited to the work of a grammar or technical school may be transferred to an appropriate school.

Other kinds of secondary school

There are some schools organized to provide secondary education of more than one type; these are known as bilateral (two types, usually grammar and modern) or comprehensive (providing courses suitable for all the children in a particular area). Schools of this kind may be established as a practical means of providing the right kind of secondary education where there are difficulties in having separate schools, e.g. where the pupils are spread over a sparsely-populated area. On the other hand, they are more frequently the result of purely educational considerations and principles as described below under 'Trends and problems'.

Independent schools

Independent schools cater for about 7 per cent of the total school population. They vary widely in type from the small kindergarten school, often conducted in a private house, to the famous 'public schools' which in many respects have set the standards and pioneered the path which the state system has subsequently followed. The usual age of entry to a public school is 13. The majority of pupils continue until the age of 18, and a large proportion go on to the universities. Most public schools use a Common Entrance Examination for the selection of new entrants and preparation for this examination is the function of the independent preparatory schools, which admit pupils at about the age of 8 and keep them until the age of 13. In these schools, subjects like Latin, French, algebra and geometry are begun at the age of 9 or 10, depending upon ability, i.e. a year or two earlier than in the state grammar schools.

Vocational education

In England and Wales, education specifically designed for the requirements of a particular profession, trade or employment as distinct from general education in subjects which are basic to a vocational education, falls within the term 'further education' as used in the Education Act of 1944 and does not form part of the statutory provision of secondary education. However, as much of the work done in the primary and secondary stages lays the foundation for successful further education, a brief explanation of the educational facilities open to those who have left school is given below.

In the United Kingdom, there is a long tradition of post-

school work in technical colleges and evening institutes but in recent years the demand for trained scientists, technologists, technicians and craftsmen has grown apace and the attention of the Government, educationalists and industry has been focused on the adequate education, both technical and liberal, of skilled workers of all grades. Through the years, the pattern of vocational education had developed haphazardly but it is now being rapidly remodelled to a national plan of local colleges at the lowest level, rising through area colleges and regional colleges to a limited number of colleges of advanced technology which offer courses and research facilities similar to those in universities but of a kind more closely linked with industrial requirements. In addition, there are a number of national colleges providing advanced courses for the work of certain specialized industries. In 1956 the Government announced a 5-year development programme to cost £85,000,000 and in 1959 a further 3-year programme of £54,000,000. Attention has recently been directed to the need for more comprehensive facilities for education in commerce and agriculture which are at present available both in specialized institutions and in departments of technical colleges.

Vocational education may be part-time or full-time. Students come from all kinds of secondary education. Many start soon after leaving a secondary modern school at the age of 15, others stay on at school till they are 16, 17 or 18 and so enter on their vocational studies better prepared and perhaps with successes in the General Certificate of Education which may exempt them from a certain amount of preliminary work in the technical college. Many full-time students follow what is called a 'sandwich' course, made up of alternating full-time periods (generally of 6 months each) in college and in industry leading to a qualification at degree level. Most part-time students are released by their employers to attend technical college for one day a week with supplementary evening study. Apprenticeship in itself does not come under the aegis of the educational system but most apprenticeship schemes make great use of the educational facilities available. A number of the largest employers and nationalized undertakings run their own education and training schemes in close alliance with the education authorities.

The facilities outlined above provide vocational education not only for all forms of industry but also for commerce and management. Facilities are also offered in technical colleges or in special colleges and in a limited number of private establishments for a wide range of other vocational studies—the merchant marine, agriculture, art and architecture, drama, domestic science, nursing, aeronautics and many others. The armed forces have their own establishments for vocational education and training.

Teachers

Teachers in maintained schools are not civil servants, that is to say, they are not employed by the Central Government. They are employees of the local education authority as a result of application for employment, and not of direction; they are free to move from the service of one authority to that of another or into direct-grant and independent schools (service in independent schools may, in certain circumstances, affect pension rights). Many teachers move voluntarily several times in the course of their careers in search of experience and promotion.

Teachers seeking a career in publicly-maintained schools must be approved as 'qualified' by the Ministry. Apart from university graduates, most teachers in primary and secondary schools qualify by studying at a training college. All the colleges in a given area are linked to the institute or school of education of a university, in an area training organization; this body approves the courses at the colleges, examines students and recommends those successful to the Ministry for approval as 'qualified teachers'. In the area training organizations, the university and its department of education and the training colleges and local education authorities in the area are represented. There are over 150 training colleges in England and Wales. Some are provided by local education authorities and others by voluntary organizations usually connected with a religious denomination. The voluntary colleges receive from the Ministry grants for the full cost of maintenance and of up to one half or, for certain projects, three quarters of their approved capital expenditure.

Some colleges are for men or women only, others are mixed. Training colleges vary widely in the courses they offer; some specialize in primary work, others in a particular subject such as physical education or art. The general courses at present last for 2 years, but this is to be increased to 3 from 1960; the course is already of 3 years' duration for women specializing in housecraft or in physical education at the highest level. Students usually enter college at 18 and must normally have obtained at least 5 passes at the ordinary level of the General Certificate of Education. They must also be in good health and be physically fit for teaching. Students who are British subjects living in England and Wales and who intend to teach in grant-aided schools may receive financial help to cover the cost of tuition, board and lodging, travelling and other personal expenses according to their own or their parents' means.

At the present time university graduates may become qualified teachers without further special training but many graduates intending to teach pursue a 1-year post-graduate course of professional training. These courses, for the most part, are held in university departments of education and are supervised by the area training organizations. British subjects living and intending to teach in England and Wales may obtain grants from the Ministry towards the cost of this training.

Salaries in maintained schools are in accordance with scales agreed to by representatives of the authorities and of the teachers and approved by the Minister. There is a basic scale related to length of service to which additions are made in respect of extra training and qualifications, and for responsibility such as headship of a school or department or for organization and general supervision of the teaching of a particular subject throughout the school. Contributory pension arrangements have been established by statute and are administered directly by the Ministry. They apply to service in many independent schools as well as in maintained and direct-grant grammar schools and are designed to permit movement in the course of a career, including periods of teaching abroad.

TRENDS AND PROBLEMS

In the secondary schools. In December 1958, the Government published a White Paper 'Secondary Education for All—a New Drive', representing an outline of its policy in this field over the next 5 or 6 years. On the one hand, it contained an account of the progress which the Government hopes to make in improving the physical conditions of secondary education. About £300,000,000 are to be spent in 5 years on new school buildings, with the aim of getting rid of the remaining 'all-age' schools (schools providing both primary and secondary education, usually in unsatisfactory buildings, and attended by about 6 per cent of the country's children) and of improving facilities of all kinds in these old secondary schools when accommodation limits the courses which can be offered. Particular attention will be given to the improvement of facilities for science teaching, especially in grammar schools.

A second part of the government's policy is directed towards increasing the supply of teachers, concurrently with the lengthening of the training course to 3 years. Sixteen thousand additional places in training colleges are to be provided, partly by extending existing colleges but also by creating new ones, particularly in or near university towns so that the students may benefit from association with others pursuing higher education. The Government also intends to continue its policy of controlling the distribution of teachers in the interests of those areas which find it difficult to recruit them. This policy, inaugurated in 1956, has already brought substantial benefits to some industrial areas which had particularly unfavourable staffing ratios. It is hoped to ensure by these means that, by the mid-1960s, no classes in primary schools will have more than 40 children, the maximum prescribed by the Ministry's regulations, and that the number of secondary school classes with more than 30 children (the corresponding prescribed figure) will have been greatly reduced.

The White Paper also set out the government's attitude towards the organization of secondary education. It emphasized that different patterns would suit different areas, and that the principal objective was the provision of an adequate choice of secondary schools offering overlapping courses so that every child should have the chance to go to the limit of his abilities. In new housing areas lacking established secondary schools, or in sparsely populated areas where the alternative was a profusion of rather small and possibly unsatisfactory schools, the comprehensive school may be a practicable solution; but the Government has made it plain that it will use the powers vested in it by the Education Acts to prevent the closure or amalgamation of thriving grammar or modern schools simply to enable large comprehensive schools to be built.

The provision of better buildings, the recruitment of more and better-trained teachers and the growing public interest in education, reflected in the striking increase in the number of children in modern schools staying on beyond the age of 15 and in the number of grammar school children undertaking sixth form courses leading to full-time further education, all give cause for hope that steady progress will be made in the next few years towards securing a more fully and more liberally educated society. There are plenty of problems, such as the shortage of science teachers, the dangers of over-specialization in sixth form courses as a result of university entrance requirements and the competing demands of other services for the resources of capital investment on which education leans so heavily; but education is already the major social service in terms of the national budget, and politicians and the public are beginning to recognize that expenditure for this purpose is capable of yielding a more valuable reward than any other.

In establishments of further education. In the field of vocational education within the age-range 15 to 18 years conducted, not in schools, but in the technical colleges, commercial colleges and schools of art, the main attention in the coming years is likely to be concentrated on: (a) expanding the provision of full-time and sandwich courses both for the training of technicians and as a preparation for advanced courses for scientists, technologists and managerial staff in industry; (b) increasing the facilities in colleges generally for the part-time education of employees in industry at all levels, and especially of technicians; (c) developing and improving commercial education, both full-time and part-time; (d) remodelling the system of education for agriculture.

Much still remains to be done to bring the benefits of part-time vocational education, which has been very successfully developed for the skilled workers in industry, within the reach of the semi-skilled and unskilled workers, who at present rarely maintain any contact with education after leaving school at 15. The Education Act of 1944 included a provision for the establishment of 'county colleges' which would provide compulsory part-time education (one day a week) for all young people up to the age of 18 who were not receiving full-time education. The question of whether and when this far-reaching reform should be implemented is still an open one and is being widely discussed. The chief difficulty over its introduction, apart from the problem of the supply of suitable teachers, is the fact that there is little in the existing part-time system of vocational education, orientated as it is towards skilled employment, which provides any guide in devising suitable courses for the non-skilled worker.

STATISTICS

Population (mid-year 1958 estimate): 45,244,000.
Area: 58,345 square miles; 151,113 square kilometres.
Population density: 775 per square mile; 299 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58 there were some 7,638,646 students attending full-time educational courses at all levels, representing about 17 per cent of the total population. There were in addition about 2,685,025 people attending further educational and adult evening classes. Of full-time pupils 63 per cent were enrolled in pre-primary and primary schools, 35 per cent in general secondary schools, 0.6 per cent in special educational institutions and less than 2 per cent in universities and teacher training colleges. Girls made up just under half the enrolment in primary and secondary schools, 77 per cent in teachers' colleges and 24 per cent in universities and university colleges. Full-time teachers in primary, general secondary schools and teacher training colleges numbered 298,871 in 1957/58 of whom 62 per cent were women. The average pupil-teacher ratio, excluding part-time staff, was 28 in primary and 21 in general secondary schools. Compared with 1953/54, enrolment had increased by 6 per cent in primary schools, by over 21 per cent in general secondary schools, 13 per cent in teacher training colleges and 19 per cent in universities. (See Table 1.)

Trends in secondary education, 1930–57. Over the years 1930–57 the estimated child population 15–19 years old declined from 3,405,000 to 2,771,000. Nevertheless average enrolment in general secondary schools since the war has steadily increased, the general secondary enrolment ratio rising from 65 to 88 over the period 1945 to 1957. (See Table 3.)

Examination results in secondary education, 1953–57. No diploma or certificate is awarded in the United Kingdom upon completion of secondary education; the General Certificate of Education can be taken by subject at any stage of the secondary course. Figures available on the numbers of pupils aged 17 to 18, i.e. pupils who may be considered to have completed the general secondary school course, show an increase of 30 per cent in 1957/58 compared with 1953/54. Girls made up about 45 per cent of the total in both years. It is estimated that over 50,000 pupils completed secondary schooling in 1957/58 of whom about 22,000 were girls.

Educational finance, 1957/58. Total expenditure on education in the fiscal year beginning April 1957 amounted to 618,055,000 pounds sterling, representing approximately £13.8 per inhabitant. Of total receipts, 69 per cent came from the Central Government, 29 per cent from local education authorities, less than 1 per cent from fees and the remainder from university donations and research grants. Capital expenditure amounted to £23,606,000 or 4 per cent of the total spent. Debt repayments were very high, amounting to £42,168,000 or 7 per cent of the total expenditure. Recurrent expenditure, 89 per cent of the total, is given by level and type of education in Table 2C. A separate breakdown of receipts and expenditure for universities only is given in Tables 2D and 2E.

5. Including some pupils doing advanced work. In 1957/58, there were 76,279 (F. 33,027) in publicly maintained schools and about 33,000 (F. 13,000) in the other types of school.
6. Including all-age schools, already counted under primary.
7. In addition, there were part-time teachers who numbered: 9,360 (F. 6,422) in 1957/58; 7,926 (F. 5,309) in 1956/57; 7,515 (F. 4,783) in 1955/56; 7,103 (F. 4,377) in 1954/55; 6,890 (F. 4,133) in 1953/54.
8. Not including technical teacher training colleges. In 1957/58 there were three of these colleges with 362 students (F. 88).
9. Not including advanced courses in further education. The number of students following these courses were: 69,877 (F. 6,913) in 1957/58; 62,158 (F. 6,505) in 1956/57; 53,495 (F. 6,109) in 1955/56; 47,294 (F. 5,953) in 1954/55; 45,474 (F. 5,816) in 1953/54.
10. Not including courses in non-recognized private establishments.
11. Refers to number of institutions, not number of courses.
12. Full-time staff only. Most adult education tutors teach part-time.

2. EDUCATIONAL FINANCE, 1957/58 (in thousand pounds sterling)[1]

A. RECEIPTS BY SOURCE

	Amount

1. Figures for the years 1930–37 are estimates and exclude independent schools.

SCOTLAND

As education in Scotland is controlled by the same Government and Parliament as control education in England and Wales, it is not surprising that the systems of education on the two sides of the Anglo-Scottish border have strong similarities. For this reason it will be possible to condense parts of this article by making suitable references to the article on England and Wales. Nevertheless, despite the similarities between the two countries, there are also important differences, principally in the classification of schools, in the qualifications and training of teachers, and in the fact that the percentage of children attending private schools is much smaller in Scotland than in England.

A highly democratic conception of education with universal free education leading on to the universities was set before Scotland by the Reformers as early as the sixteenth century. Nevertheless, while there were schools before the Reformation and many were established later, it was not until the Act of 1872 that universal free primary education became compulsory. Similarly, although widespread secondary education had developed earlier, it was the 1918 Act which first made it the duty of all local authorities to provide free secondary education for all who wanted it; but parents were still given the right to send their children to fee-paying schools if they so desired. The Education (Scotland) Act of 1945 brought about further improvements in primary and secondary education but also provided, particularly through a more generous bursary (scholarship) system, for a wide extension of further education (education for persons having left school), without financial hardship, for all those who desired it.

All earlier Acts were consolidated into one document, the Education (Scotland) Act, in 1946. This has been amended by the Acts of 1949 and 1956.

THE EDUCATIONAL SYSTEM

Political, legislative and financial responsibility for education in Scotland rests primarily upon the Government, with the Secretary of State for Scotland as the responsible Minister and the Scottish Education Department as his administrative agency. (The responsible Minister for England and Wales is the Minister of Education who acts for England and Wales only.) The detailed administration of education in Scotland is undertaken by the 35 education authorities (the four main cities and the 31 counties); it is these authorities which build and maintain schools and which engage and pay teachers. The schools which they administer are called public schools and the work of the education authorities in this regard is largely controlled by regulations made by the Secretary of State. The functions of central (government) control and of local (education authority) control are very similar in England and in Scotland.

There are also 45 schools of all types which are not under education authorities but are conducted by voluntary bodies which receive grants from the Secretary of State. These 'grant-aided' schools are required to satisfy the Schools Code, the regulations made by the Secretary of State to govern the conduct of schools. Private agencies may also conduct schools to cater for particular interests or to provide education of particular types. Such schools must be registered and must comply with the Secretary of State's requirements regarding minimum standards of accommodation and efficiency; they enrol about 2.5 per cent of the total school population.

Under the present Acts it is the duty of parents to provide their children between the ages of 5 and 15 with efficient education either by sending them to public schools or by other means; and it is the duty of education authorities to ensure that adequate and efficient provision is made in their areas for all forms of primary (including nursery) and secondary schools and for further education.

Primary and secondary education is free and pupils receiving free education also receive free books and stationery. Provided that the provision of free education is adequate for all who desire it, education authorities are not precluded from maintaining in addition some fee-paying primary and secondary schools.

There are some 7,400 Gaelic-speaking children in Scotland out of a total school population of 890,000. These constitute the only native linguistic problem and the education authorities concerned are required to make adequate and efficient provision for the teaching of Gaelic in the Gaelic-speaking areas, which are mainly in the north-west of the country.

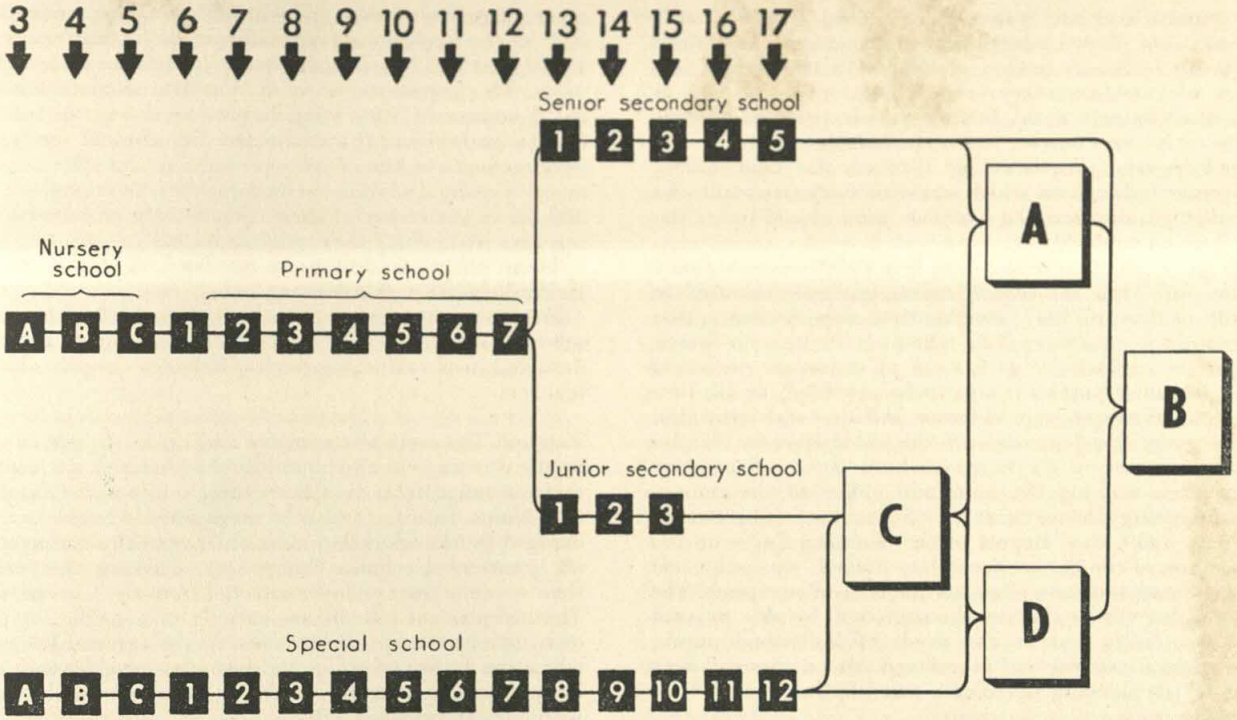
Public schools are normally conducted as Protestant schools, but wherever numbers warrant it the authorities must also provide other denominational schools. The Act requires that children should be educated in accordance with the religious beliefs of their parents and the responsible religious bodies have the right to seek the establishment, where necessary, of additional denominational schools.

The Scottish system does not at any level permit discrimination against a pupil on grounds of race, colour, religion or sex.

To help with his major educational problems the Secretary of State may seek, and from time to time does seek, the advice of the Advisory Council on Education, whose appointment is provided for in the Act. At least two-thirds of the Council are required to be drawn from such bodies as the education authorities, the universities, the teaching profession, business and industry, including both employers and workers.

Structure of the school system. This is seen in the diagram on page 1173.

Nursery schools. These are provided, where there is a demand for them, for children from 2 to 5. The children are introduced to a regime of healthy living and have their recreational needs well provided for. Although attention is paid to the development of language through speech, there is no formal education.



Primary schools. Education becomes compulsory at age 5, when children enter primary schools. The object of these schools is to establish the tools of education, reading, writing and arithmetic, but attention is also paid to physical education, history, geography, nature study, music, art and handwork. There is no common curriculum enforced by the State or by individual education authorities, but as the result of many professional conferences curricula are fairly similar all over the country.

Secondary schools. Between the ages of 11½ and 12½ pupils are normally promoted to secondary courses. They are not promoted as a result of passing an examination, but at the appropriate age are graded according to their ability. The pupils proceed to secondary courses which are adapted to their abilities and aptitudes as ascertained by the grading (promotion) procedure. Pupils who do not intend to remain at school beyond the statutory leaving age of 15—they tend to be the average and the less able pupils—take what are usually called junior secondary courses which are planned to give a rounded off education in three years; pupils who intend to stay at school for five years and have the necessary ability for harder study go to what are normally called senior secondary courses which last for 5 years or 6 years. Senior secondary courses normally include English, one, two or three foreign languages, mathematics, science, history, geography, art, music, and physical education. Junior secondary courses do not normally include a foreign language; mathematics and science are adapted to the needs and abilities of the pupils, and practical work such as woodwork, metalwork and homecraft are given considerable place.

In small towns junior and senior courses are normally run in the same school; in larger towns they may be run in the same schools or in different schools, education authorities being free to plan the organization as they see fit. Thus comprehensive schools are commonly found in the smaller towns, although not uncommonly in larger towns also.

Classes are restricted to 40 in the first three years of secondary courses and to 30 in the later years; practical classes are restricted to 20 pupils. In fact, many classes have fewer than the limits prescribed.

There are no standarized curricula, the headmasters and teachers being at liberty to plan their schemes of work as they please, but the schemes are subject to scrutiny by inspectors of schools. The fact that all senior secondary

GLOSSARY

junior secondary school: lower secondary school providing general education but with curriculum including commercial, technical, home economics and rural courses.

nursery school: pre-primary school.

senior secondary school: general secondary school leading to university entrance but including a number of non-academic courses.

special school: school providing pre-primary, primary and secondary education for handicapped children.

INSTITUTIONS AT POST-SECONDARY LEVEL

A. Universities (all faculties).
B. Teacher training colleges.
C. Establishments of further education: institutions offering part-time and full-time courses mainly vocational in nature.
D. Central institutions: colleges offering full-time and part-time courses serving national or regional needs in technology, industry, etc.

pupils face at the end of their 5- or 6-year course a common examination, the Scottish Leaving Certificate examination set by the Scottish Education Department, tends to some extent to standardize the content of the various subjects.

Further education. A wide range of full-time and part-time (often evening) courses is available for students who have left school, some being at an advanced level. Some courses are cultural, others mainly vocational.

The universities. Scotland has four long-established universities at Aberdeen, Edinburgh, Glasgow, and St. Andrews and Dundee. The universities are autonomous institutions not in any way under the control of the State, although they derive a large part of their finances from state grants.

THE DEVELOPMENT OF SECONDARY EDUCATION

Some of the high schools and academies of Scotland date back for several centuries. In the earlier days, too, the headmaster of the village school not infrequently educated one or other of his bright pupils (the 'lad o' pairts') up to university entrance. The Education (Scotland) Act 1872 recognized schools of secondary type but left them to be financed from local resources and fees. In 1885 inspection of these schools was undertaken by the Department, and in 1888 the Department instituted a national examination, the Leaving Certificate, which provided an award for the satisfactory completion of a secondary course and at the same time served as a passport to the universities and the professions. Although this examination has changed

considerably over the years, its essential functions still remain; it has played a large part in bringing all secondary schools up to a satisfactory standard. In the early years of this century secondary schools became increasingly a public function and many further schools, providing 3-year courses or 5-year courses, were established.

The Education (Scotland) Act 1918 was the main charter of secondary education, which was then made free to all who desired it. Public secondary schools were placed under the 35 education authorities.

Advances which were to be made in 1939 were postponed by the war. Thus the school leaving age was increased to 15 only on 1 April 1947. By this time also the conception of secondary education had widened: it was no longer thought of exclusively as a form of academic education suited for abler pupils; it was to be provided for all, in a variety of forms to suit different abilities and aptitudes.

Two recent developments are the publication in 1955 by the Department of its memorandum 'Junior Secondary Education', defining the aims and policy of the courses and discussing the content of the various subjects. In February 1959, the 'Report of the Working Party on the Curriculum of the Senior Secondary School' was published and its main recommendations have been accepted. The chief results will be that headmasters will be able to meet to an increasing extent the needs of individual pupils, departmental control will be relaxed, and a new ordinary grade of the Leaving Certificate examination designed for less able pupils will be instituted.

Legal basis

Secondary education in Scotland is founded upon the Education (Scotland) Act 1946, and upon the Schools (Scotland) Code 1956, which prescribes the general requirements regarding size of classes, qualifications of teachers and arrangements for schemes of work. Other important regulations, e.g., on teachers' salaries, will be mentioned at appropriate points later.

Children must remain at school until they are 15 years of age.

To bridge the gap between age 15 and age 16 at which apprenticeships begin, pre-vocational courses of further education have been set up.

Administration

The functions of the Secretary of State, the Scottish Education Department, the education authorities and the Advisory Council have already been explained.

Headmasters of public (education authority) schools and grant-aided schools control the day-to-day conduct of their schools as regards time-tables, courses, syllabuses, homework and choice of textbooks, but they are responsible to the local authorities or governing bodies as the case may be. In private schools, the governing bodies normally devolve much responsibility upon the headmaster.

Supervision and inspection. Headmasters and staffs are given a great degree of freedom. Her Majesty's Inspectorate of Schools in Scotland is a unit within the Scottish Education Department numbering about 100 men and women. Vacancies are advertised and candidates are selected after a consideration of their general and special qualifications and experience. They are normally persons of high academic attainment and have usually been teachers for at least five years. The inspectors (a) advise the Department whether the Secretary of State's regulations are being carried out by the authorities; (b) advise the Department on future developments in the education areas; (c) are the Department's principal advisers on more purely educational affairs; and (d) in the course of their rounds, help and advise the teachers with whom they come in contact.

There are no inspectors in Scotland employed by the local education authorities.

Parent-teacher associations have been formed at many schools to promote the educational well-being of the children and increased understanding between the parents and teachers.

Finance. The costs of secondary education are met in part by the Government and in part by the education authorities, under arrangements similar to those outlined for England and Wales. In a few publicly maintained schools, fees are charged by the education authorities, and the managers of all grant-aided schools charge fees, deriving the rest of their revenue from endowments and from the Government. The independent schools are entirely responsible for their own finance, except that a few receive grants from the education authority, where the authority consider that they are performing a service which the authority would otherwise have to provide itself.

The cost of building is usually incurred on a loan, the interest and repayment charges being met by the Government and by the education authority in the same way as all other annual expenditure is met.

Teachers are paid by the education authority which employs them, but their salaries are laid down by the Secretary of State in regulations made on the advice of the National Joint Council to deal with the salaries of teachers in Scotland, a body composed of equal numbers of representatives of the teachers and of education authorities. These regulations prescribe basic salaries which vary according to the qualifications and length of service of the teachers. Head teachers and all others in posts of special responsibility receive additional allowances which depend upon the size and importance of their posts. Women's salaries, which were formerly less than the men's, are now in process of assimilation to the men's.

The Education (Scotland) Act 1946 empowers authorities to grant financial aid to parents to enable pupils to take advantage, without financial hardship, of any educational facilities available to them. The decision whether or not to make an award rests with the education authority, but any awards made must be in accordance with the Education Authority Bursaries (Scotland) Regulations prescribed by the Secretary of State. The authorities may pay the fees of pupils attending fee-paying schools and, where pupils over the age of 15 attend public schools, the bursary is, in general, the amount by which the cost of maintaining the pupil exceeds the amount which the parents might reasonably be expected to contribute for themselves. Bursaries covering maintenance and fees are also provided, on the same general principles, for pupils who proceed from school to higher educational institutions.

Building and equipment. The period since the war has been extremely active in regard to school building.

When a new school is planned, account is taken of the number of pupils likely to be in attendance and of the variety of courses which will be provided. A calculation is then made of all the rooms (classrooms, laboratories, gymnasia, etc.) which will be required, and a minimum area is imposed for each of these rooms. The authorities are then allowed to add 80 per cent to the total area so calculated in order to make provision for corridors and ancillary accommodation. By careful planning it is possible for the authorities' architect to use part of this 80 per cent to enlarge particular classrooms or to provide additional rooms. The school so planned is then erected according to financial standards which permit good amenities and yet prevent extravagance.

The planning of buildings is undertaken by the education authorities but the general standards are laid down by the Department. These standards have been devised to ensure comfortable heating, adequate lighting and good sanitation. In recent years the Department have employed a team of architects who have made a special examination of school architectural problems and their advice is available to authorities.

School welfare services. These services—the medical and dental inspection of school children, the provision of meals and milk, and the provision of transport for pupils who reside far from their school—are provided in Scotland on the same lines as in England and Wales.

Education authorities are required to ascertain which children, because of a physical or mental handicap, need special educational treatment, and to provide it for them in special schools. The children concerned must remain at school until 16. The later years of the course, particularly for the physically handicapped, are similar to secondary courses provided in other schools.

TYPES OF SECONDARY EDUCATION

The promotion procedure for the transfer of pupils from primary to secondary schools, the classification of secondary schools into junior secondary and senior secondary schools, and the fact that junior and senior secondary schools are frequently united have been alluded to above.

Fully 30 per cent of the pupils in an age group go to senior secondary schools and the remainder to junior secondary schools. The high percentage of pupils who embark upon the exacting programmes of senior secondary schools means that few children of the necessary ability fail to get the opportunity of senior secondary education (unless their parents desire them to attend junior secondary schools); on the other hand, it means that a considerable number of children find they are not able successfully to complete the course. This has resulted in many pupils leaving school prematurely and is one reason why an ordinary grade of the Leaving Certificate Examination is to be introduced.

In both junior and senior secondary schools the teachers set their own examinations on which the reports for parents are based. If it is observed that a pupil is capable of undertaking a course harder than that on which he has embarked he is encouraged to change to the more ambitious course; if on the other hand he finds the course which he has chosen too hard he may switch over to an easier one.

Guidance on careers is afforded as described in the article on England and Wales.

Most secondary schools provide a range of extra-curricular activities, which include sports, recreations and societies of many kinds. In most schools the pupils are encouraged to share in the management of these activities, as they also do, especially in senior secondary schools, in the maintenance of school discipline.

The school year extends normally to at least 40 weeks and is divided into three terms by the main holiday periods, Christmas (1½ weeks), Easter (1½ weeks) and Summer (6–8 weeks). For senior secondary schools the school year commences in all cases about the beginning of September; in junior secondary schools the school year begins then, but may also begin for separate intakes of pupils at one or two other dates. The school week extends from Monday to Friday inclusive, and each day is normally broken into seven or eight periods.

Examinations. There is no national examination for junior secondary pupils, but some education authorities provide an examination covering their own area. The pupil on leaving school receives a record to enable him to seek posts in the outside world. The Scottish Leaving Certificate examination is the aim of pupils who attend the senior secondary schools. Pupils normally take their subjects in this examination, either on the higher grade or on the lower grade, in the fifth or sixth years of their course, and many take subjects in both years. Passes in this examination, of the requisite number and kind, are accepted by the universities for entrance, and they also form a passport to the professions.

Vocational and technical education

While secondary schools, whether junior or senior, provide general education and avoid vocational education in any but the broadest sense, and while there are no vocational or technical schools in Scotland, there is a wide range of vocational and technical courses provided in centres of further education, maintained by local authorities, at the national centres of further education (the central institutions), and, at the highest level, at the universities. The schools, however, do provide a certain amount of practical instruction in commercial subjects, woodwork, metalwork, homecraft, etc. These comprise a very important part of the curriculum of junior secondary schools and are pursued, even to a fairly advanced level, in senior secondary schools, some pupils electing to take these subjects at the Leaving Certificate examination.

Teachers

All teachers in Scottish schools are required to take professional training and all male teachers of general subjects must be university graduates. All the senior posts in senior secondary schools and many in junior secondary schools are filled by honours graduates. The course of professional

training for graduates normally lasts for one year, but is at present reduced to two terms for honours graduates training to teach in senior secondary schools the subjects in which they have specialized. Women who are not graduates may take 3-year courses of training at colleges of education, but are then normally employed only in primary schools.

Specialist teachers of such 'practical' subjects as art, music, commercial subjects and homecraft usually acquire diplomas in the subjects which they will teach before taking professional training. The diploma courses, usually taken in central institutions, vary in length but in general last for 3 years, and the professional training, which is taken subsequently, for two terms. Some teachers of homecraft and educational handwork—i.e. woodwork, metalwork, technical drawing and mechanics—and all teachers of physical education take their professional and subject training concurrently. Subject training in educational handwork and in physical education are given in the colleges of education. Concurrent courses normally last for 3 years.

Teacher training is concentrated in seven colleges of education. The four main colleges are situated in the cities of Glasgow, Edinburgh, Aberdeen and Dundee, and train students of both sexes. There are also two residential Roman Catholic colleges for women and a college for women teachers of physical education.

TRENDS AND PROBLEMS

The main practical problems facing secondary education at the present time arise from the large number of children born in the immediate post-war years who will crowd the secondary schools for some years to come. Already a large amount of school building has taken place to accommodate this population 'bulge'; and, with this necessary new building either completed or under way, the Government have now asked the authorities to undertake as rapidly as possible a large programme of modernizing older schools.

The most difficult problem of all relates to staffing, especially as the increased demand by industry and commerce for university graduates has influenced the number aiming at teaching, particularly in mathematics and science. Fortunately, however, the number of graduates entering the training colleges in the last two years has shown a marked upward trend.

While it remains the purpose of secondary schools to provide a general education, it is considered that there is need to pay increased attention to the varying abilities, aptitudes, interests and vocational future of the pupils. Thus, while it is recognized that for the ablest pupils there should be no relaxation of the high academic aims which have hitherto prevailed, greater efforts should be made to check educational wastage amongst the large group of pupils who fall into the next category of ability, and to enable as many as possible of them to attain the highest academic success that is within their compass. For this reason headmasters are being asked to adapt some of their courses more fully to the needs of this large group. It is also hoped that the introduction from 1962 of the new ordinary grade in the Leaving Certificate examination will encourage a larger number of pupils to complete senior secondary education at least to this level.

In order to meet the demands of a technological age, there may be some swing, at least on the part of some pupils, from linguistic studies to the sciences.

STATISTICS

Population (mid-year 1958 estimate): 5,223,000.
Area: 30,411 square miles; 78,764 square kilometres.
Population density: 172 per square mile; 66 per square kilometre.

Summary of school statistics, 1953–57. In the school year 1957/58 some 903,919 students were enrolled in full-time educational institutions at all levels, representing about 18 per cent of the total population. Of the total enrolment, 69 per cent were pupils in kindergarten and primary schools, 28 per cent in general secondary schools, 2 per cent in higher educational institutions including teacher training colleges and the remaining 1 per cent in special schools for delinquents and the handicapped. Girls made up about half the enrolment in primary and general secondary schools, over 81 per cent of enrolment in teacher training colleges and 28 per cent at university level. The teaching staff in all full-time institutions numbered 38,882 in 1957/58 of whom 63 per cent were women. The average pupil-teacher ratio was 31 in primary and 16 in general secondary schools. Compared with 1953/54 enrolment increased by 2.5 per cent in primary schools and by nearly 7 per cent in general secondary schools. Enrolment also increased in institutions for teacher training and at university level by about 17 per cent over the period under review. (See Table 1.)

Enrolment trends in secondary education, 1930–57. Average enrolment in general secondary schools increased from 172,000 in the five-year period 1930–34 to 247,000 in the three years 1955–57. Over the same period the estimated child population 15–19 years old declined from 440,000 in 1930–34 to 360,000 in 1955–57. The ratio of children enrolled in secondary schools thus increased from 39 to 69 over the years 1930–57. (See Table 3.)

Examination results in secondary education, 1953–57. No data are available which show pupils entering and passing examinations. Children completing six years of secondary schooling increased from 2,638 in 1953/54 to 3,656 in 1957/58; those completing three years of secondary schooling increased from 29,767 to 30,181 over the same period.

Educational finance, 1957/58. Total expenditure on education in the fiscal year beginning April 1957 amounted to 104,647,411 pounds sterling, representing approximately £20 per inhabitant. Total receipts from all sources amounted to £86,207,428 of which 64 per cent came from the Central Government, 28 per cent from local authorities, less than 1 per cent from tuition fees and the remaining 7 per cent principally from other receipts from parents, and teachers' superannuation payments. Capital expenditure financed by loans amounted to £20 million or nearly one fifth of the total spent. (See Table 2.)

NORTHERN IRELAND

The Education Act (N.I.) 1947 provides that the statutory system of public education shall be organized in three progressive stages to be known as primary education, secondary education and further education.

The structure of the school system is seen in the diagram on page 1181.

Secondary schools fall into two main categories; intermediate schools providing 4-year courses of study designed for pupils who intend to leave school at 15, and grammar schools providing 5- or 6-year courses of study for pupils who intend to remain at school until 17 or 18 and to take the Grammar School Certificate examinations conducted by the Ministry of Education for Northern Ireland.

As in England and Wales, the break between primary and secondary education comes when the pupil reaches the age of about 11 years. If a pupil does not wish to pursue the more academic form of education provided at the grammar school (or is deemed to be unfitted to profit from such education) he is transferred to the secondary intermediate school, if such a school has been provided in his locality; otherwise, and as a special arrangement pending completion of educational reorganization, he continues at the primary school. The first two years of the intermediate school course provides continuing general education; in the last two years the course has a practical bias. On completion of the two years' general course the pupil has the opportunity of transferring to a grammar school; alternatively he may transfer to a junior technical school. The latter is a type of intermediate school which is conducted in association with an institution of further education and which offers practical courses (for boys only) and is intended to cater for pupils who propose to take up apprenticeships or other form of employment in engineering, building and allied trades. Education at the intermediate schools is provided free of charge.

Local education authorities award grammar school scholarships to pupils who pass a qualifying test conducted each year by the Ministry of Education and a very high proportion of the pupils in grammar schools are holders of scholarships. However, an important feature of the Northern Ireland system is the arrangement which requires certain schools to reserve up to 80 per cent of their places for scholarship holders but which permits the remaining places in those schools to be allocated to fee-paying pupils. The problem of secondary education is still the subject of much thought and research.

Many of the new secondary intermediate schools which will be necessary in order to make secondary education available to all children will be under voluntary management as are the majority of the grammar schools. The importance of the voluntary element in the Northern Ireland educational system is recognized by the decision of the Government to make grants equal to 65 per cent of the expenditure incurred on the provision of new, or the improvement of existing, voluntary schools.

GLOSSARY

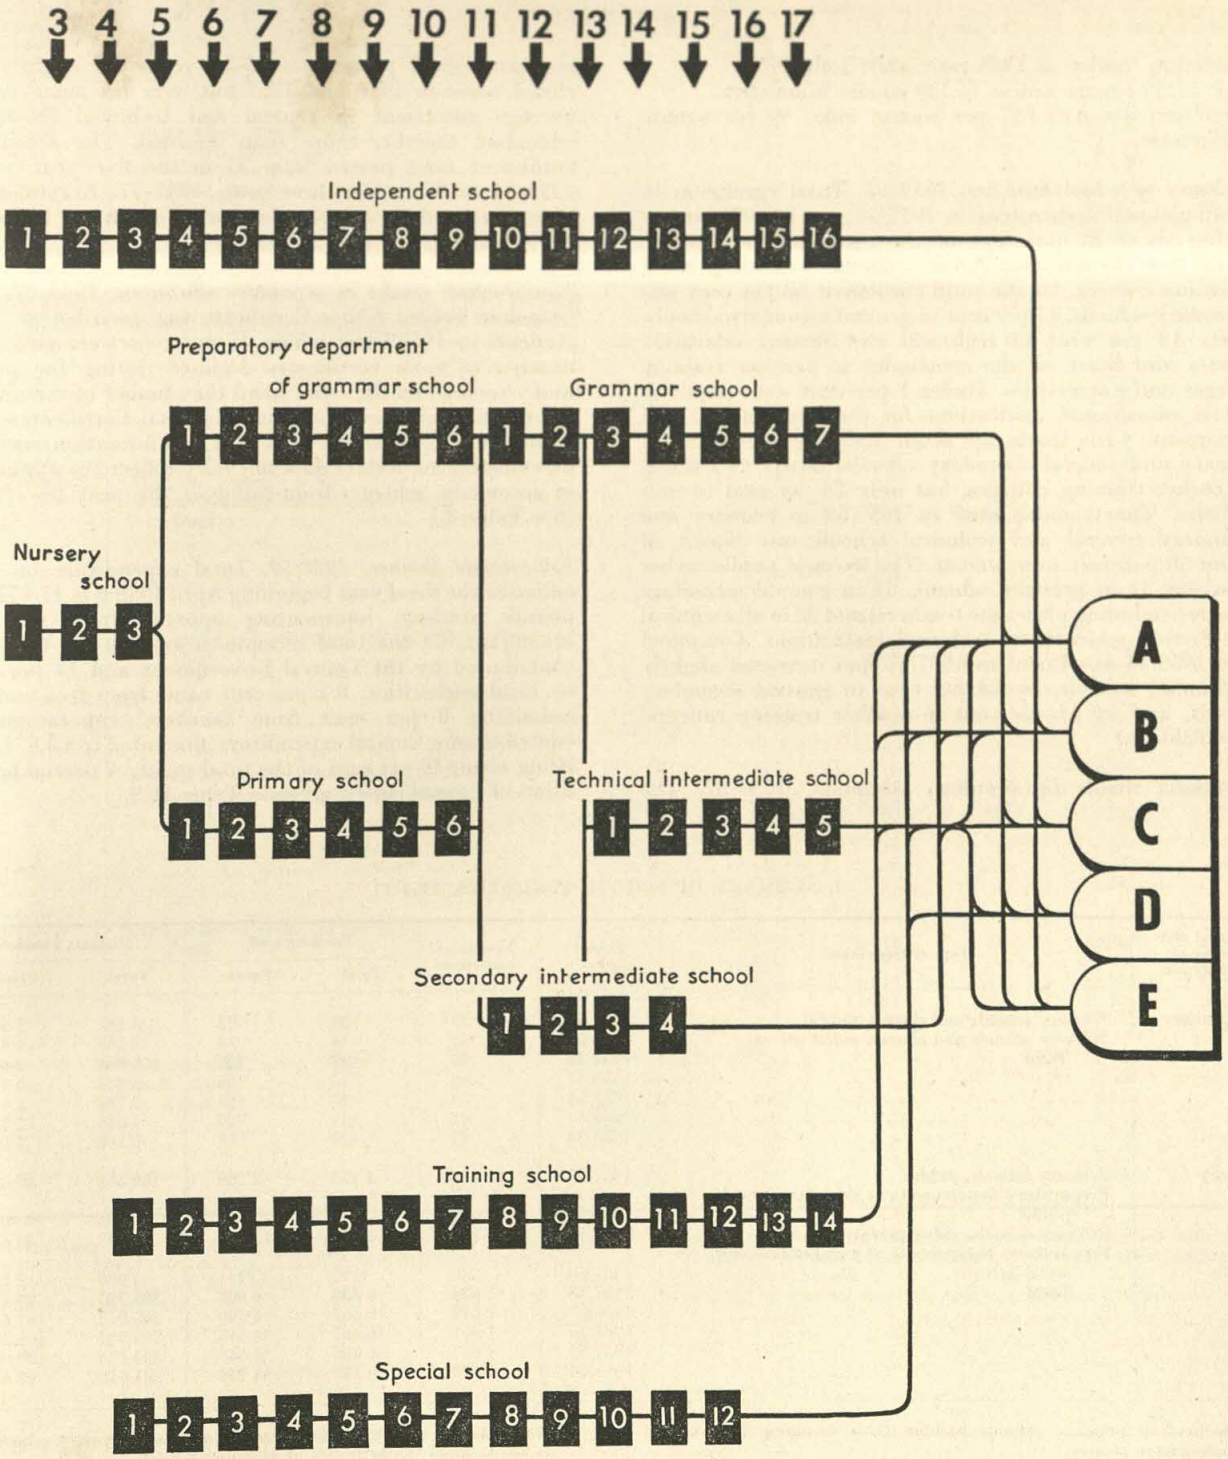
grammar school: general secondary school.

independent school: private school providing pre-primary and/or primary and/or general secondary education.

nursery school: pre-primary school.

preparatory department of grammar school: primary classes attached to a general secondary school.

secondary intermediate school: lower general secondary school with pre-vocational bias.



special school: school providing primary and secondary education for mentally or physically handicapped children.

technical intermediate school: vocational secondary school.

training school: school providing primary and secondary education for delinquent or vagrant children.

INSTITUTIONS AT POST-SECONDARY LEVEL

A. Adult education centres.
B. Establishments of further education: institutions offering full-time and part-time courses, mainly vocational in nature.
C. Agricultural colleges.
D. Universities (all faculties).
E. Teacher training colleges.

STATISTICS

Population (mid-year 1958 estimate): 1,403,000.
Area: 5,459 square miles; 14,139 square kilometres.
Population density: 257 per square mile; 99 per square kilometre.

Summary of school statistics, 1953–57. Total enrolment in all educational institutions in 1957/58 was 308,037, representing about 22 per cent of the estimated population. There were in addition 3,635 students attending adult education courses. Of the total enrolment 68 per cent was in primary schools, 17 per cent in general secondary schools, nearly 13 per cent in technical and further education courses and most of the remainder in teacher training colleges and universities. Under 1 per cent were pupils in special educational institutions for the handicapped and delinquent. Girls made up about half the enrolment in primary and general secondary schools, nearly two thirds in teacher training colleges, but only 23 per cent in universities. The teaching staff in 1957/58 in primary and secondary general and technical schools was 10,628, of whom 59 per cent were women. The average pupil-teacher ratio was 31 in primary schools, 21 in general secondary schools (excluding part-time teachers) and 23 in all technical and further educational technical institutions. Compared with 1953/54 enrolment in 1957/58 had increased slightly in primary schools, by 60 per cent in general secondary schools, and by 11 per cent in teacher training colleges. (See Table 1.)

Enrolment trends in secondary education, 1930–57. The estimated child population 15–19 years old slightly declined between 1930 and 1957 but over the same period average enrolment in general and technical secondary education together more than doubled. The secondary enrolment ratio passed from 31 in the five year period 1930–34 to 75 in the three years 1955–57. Enrolment in general secondary schools alone was four times higher in 1957 than in 1930. (See Table 2.)

Examination results in secondary education, 1953–57. The Grammar School Senior Certificate was awarded to 2,554 students in 1957/58 of whom 47 per cent were girls. The number of these certificates declined during the period under review; on the other hand the number of certificates for technical studies, including National Certificates, was higher in 1957/58 than in 1953/54. The information available on examination results does not fully reflect the expansion in secondary school enrolment over the past few years. (See Table 3.)

Educational finance, 1958/59. Total expenditure on education in the fiscal year beginning April 1958 was 17,177,753 pounds sterling, representing approximately £12 per inhabitant. Of the total receipts, nearly 80 per cent was contributed by the Central Government and 14 per cent by local authorities; 0.1 per cent came from fees and the remaining 6 per cent from teachers' superannuation contributions. Capital expenditure amounted to £3,271,988, being about 19 per cent of the total spent. A partial breakdown of expenditure is given in Table 4C.

4. Not including teacher training (secondary level) and universities.

BRITISH SOMALILAND

THE EDUCATIONAL SYSTEM

The provision of education in any but the most exiguous form may be said to have started in 1944 for boys and in 1953 for girls. Earlier attempts to introduce schools had failed for such reasons as religious prejudice or objection to the taxation which would have been entailed.

The present system consists of 3-year elementary course, a 4-year intermediate course and a 4-year secondary course, with various alternative courses following the intermediate course. Recruitment to the elementary schools is limited to pupils who have attended Koranic schools and have reached a certain standard in knowledge of the Koran. Great attention is paid to the encouragement of these Koranic schools and to attempts to improve their standard of instruction. Many do, in fact, teach Arabic and arithmetic in addition to the Koran.

As Somali is not, at present, a written language, Arabic is used as the medium of instruction in the elementary schools and a change is made to English in the first year of the intermediate course. Arabic continues as a school subject.

Until recently central government and Colonial Development and Welfare grants had been responsible for the financing of education. In the last few years, local government councils have taken over more and more responsibility for elementary education.

THE DEVELOPMENT OF SECONDARY EDUCATION

Up till 1953, a limited number of boys who had completed the intermediate course were sent to secondary schools in the Sudan. In 1953 a secondary school was started in the

Protectorate with an intake of 20 boys a year. This intake has since been increased to 25 and from 1959 will be 50. A new secondary school to house, initially, 200 pupils is at present under construction.

There is no secondary education for girls as yet, as the first girls have not yet completed the intermediate course.

Administration. There is no legislation directly affecting secondary education.

The Department of Education plans the secondary education provided with the advice of the Standing Committee on Education, which is a statutory body consisting almost entirely of Somalis. The curriculum is based on the requirements of the General Certificate of Education (United Kingdom) examination, which is taken at the Ordinary level.

The headmaster of the secondary school is directly responsible to the Director of Education. Inspection is carried out by the headquarters staff, European and Somali, of the Education Department.

Capital building costs have been met from Colonial Development and Welfare grants, and recurrent costs, including teachers' salaries, from protectorate funds. Fees of Shs. 450/- per annum are charged. Up to 20 per cent of free places are available as scholarships awarded on merit. Needy parents are assisted by the Protectorate Welfare Fund.

The school now being built will be in every way suitable as regards space, lighting and sanitation. Medical services for pupils are readily available.

TYPES OF SECONDARY EDUCATION

As stated above, there is only one secondary school which prepares students for the General Certificate of Education examination at Ordinary level. Pupils are selected by a competitive examination taken on completion of the intermediate school course. Subjects taught are English (including English literature), Arabic, arithmetic, geography, history, physics, chemistry, Koran.

The staff, with one exception, consists of graduates (European, Indian and Somali). In time, the proportion of Somalis will increase as graduates return from England and Beirut.

Vocational and technical schools. Training provided comes under the following heads:

Clerical training. Courses are run for in-service clerks and for new recruits from the intermediate schools. The subjects studied are English, arithmetic, typing, local accounting and office procedure.

Rural science training. Courses are run for junior staff of the Department of Natural Resources who have completed the intermediate school course. The subjects studied are English, arithmetic and science subjects connected with the various branches of the Department of Natural Resources.

Technical training. A limited apprenticeship scheme is in being. The future of technical education is at present under discussion, but it is likely that two 3-year courses will be instituted, for carpenters and joiners and motor vehicle mechanics, leading to the Intermediate City and Guilds (United Kingdom) examination, followed by an apprenticeship organized in conjunction with the Public Works Department.

Teacher training. A teacher training centre offers a 2-year course designed to produce teachers for the intermediate and elementary schools. As an emergency measure, shorter courses are also run to raise the proportion of teachers with some form of training. Teachers attending the short courses will later return for the full 2-year course. At the conclusion of the 2-year course, an examination is held and grade certificates are issued.

Out-of-class activities. The secondary school has committees of pupils which organize school meals, games, debates, and the school magazine. Football and hockey are played and athletic sports are held.

TRENDS AND PROBLEMS

All education at secondary level is directed towards filling the needs of the Protectorate for persons with the desired qualifications. It is hoped that as a result of the increase in secondary education, government posts which have hitherto been filled by intermediate school products will be taken by secondary school leavers; this should go far towards raising the general level of the service. Openings outside government employment are very limited.

[*Text prepared by the Department of Education, Berbera, in June 1959.*]

BIBLIOGRAPHY

SOMALILAND (Protectorate). EDUCATION DEPARTMENT. *Annual report.* [Hergeisa, Education Department.]

STATISTICS

Population (mid-year 1958 estimate): 650,000.
Area: 68,000 square miles; 176,120 square kilometres.
Population density: 10 per square mile; 4 per square kilometre.

Summary of school statistics, 1953–57. Enrolment in public primary (elementary and intermediate) schools and in secondary schools in 1957/58 was 2,253 pupils, representing a considerable increase on the 1953/54 figure of 1,444. There were in addition 120 aided Koranic schools, with 2,750 pupils and 125 unaided Koranic schools with some 2,000 pupils. The number of girls in public primary schools has increased over the period under review from 29 to 135, but there are as yet no girls in secondary education. According to official estimates, school-age population in Somaliland in 1957 was 128,000 children, distributed as

follows: 35,000 children of elementary school age of whom approximately 4.1 per cent were enrolled in school; 46,500 children of intermediate school age of whom approximately 1.4 per cent were enrolled in school; 46,500 children of secondary school age of whom approximately 0.4 per cent were enrolled in school. In all 1.8 per cent of children of school age were estimated to attend school. (See Table 2.)

Examination results in secondary education, 1957. The General Certificate of Education was held in Somaliland for the first time in 1957; 16 candidates were awarded certificates. Eleven candidates obtained the elementary teaching certificate in 1957 compared with 5 in the previous year.

Educational finance, 1958. Total expenditure on education in the fiscal year beginning January 1958 amounted to 268,115 pounds sterling; of this sum 55 per cent (£147,508) was derived from United Kingdom funds, 42 per cent (£111,545) from Territorial revenue and the remainder (£9,062) from local authorities. Capital expenditure (£134,361) made up about 50 per cent of the total spent. The distribution of recurring expenditure by level and type of education is given in Table 1.

KENYA

THE EDUCATIONAL SYSTEM

The statutory basis of the public system of education in Kenya today is the Education Ordinance of 1952 (No. 58 of 1952) which charges the Minister of Education with the promotion of education in the Colony and the progressive development of schools, and empowers him to use public funds to establish schools, make grants-in-aid or advances on loans in respect of schools and libraries, and assist in the provision of the welfare schemes which are nowadays associated with a public system of education.

The Kenya system is administered through a Department of Education with headquarters and provincial and district branches, under the over-all control of a Director of Education. The Ordinance also provides for the establishment of appropriate consultative machinery by enabling the Minister to set up a series of educational advisory councils.

The schools and colleges in the public system are either government or aided institutions, the latter being owned and run by 'managers' who must be approved by the Minister. In the case of Christian schools the duties of management are normally undertaken by various missionary agencies, while the non-Christian communities have established approved managements, usually on the basis of race, religion or sect. In smaller centres of population there is a tendency, however, for the Asians of all communities to pool their resources in a single common school.

The public system of education is supplemented by a number of private schools which receive no assistance from public funds. Such schools are required to be registered with the Department and are subject to official visits and inspection.

Education is compulsory for Europeans between the ages of 7 and 15 years and also for Asian boys in the three largest towns in the Territory. As yet there is no compulsory education for Africans.

In the technical and trades schools students are indentured as apprentices.

THE DEVELOPMENT OF SECONDARY EDUCATION

Although a common pattern for the education of all races is emerging, it will be necessary in this section to treat the various racial groups separately.

African. Until 1925 the only secondary education available for Africans was a certain amount of private tuition given by the missionaries to a few of their more promising pupils. Secondary education in the formal sense began with the establishment of the Alliance High School in 1926. This was followed by the opening of a Roman Catholic secondary school at Kabaa, later transferred to Mangu.

Education Ordinances passed in 1931 and 1934 delegated the responsibility for the financing of primary education to the local councils, the Government assuming responsibility for running a number of junior secondary schools which which previously been built and managed by the councils.

Practically all secondary schools began as primary schools to which higher classes were added, one by one, as the demand made it economically feasible to do so. Moreover, in the early period almost all schools provided teacher training side by side with the regular school curriculum. As the secondary classes became more firmly established it become possible progressively to drop the primary, and later the teacher training classes.

The academic standard of these early secondary courses was several years below the present standard and for further education up to that level only a very few selected students continued their studies at Makerere College in Uganda, where more advanced general courses, and specialized courses for teachers, agriculturists, and medical assistants were available. Indeed, it was not until 1940 that the first African school candidates (seven in number) passed the Cambridge School Certificate.

The five years immediately following World War II witnessed a marked expansion in the facilities for secondary education, and by 1950, 11 secondary schools had been established. However, as in the past, comparatively few of the pupils survived the whole of the 4-year course, and the last years of the course were given only in a few institutions. In 1950, 63 African boys passed the Cambridge School Certificate but no girls had yet reached this level of education, although two separate secondary schools for girls had by this time been established.

In 1949, the Government set up a committee known as the Beecher Committee 'to examine the scope, content and methods of the African educational system'. The findings of this committee, which were accepted by the Government in 1950, have formed the basis of subsequent development plans, although in most respects the targets set by the report have been greatly exceeded. The plan envisaged a 4-year primary course aimed at teaching vernacular literacy to the largest possible number of students, followed by a 4-year intermediate course for approximately 22½ per cent of these, and again by a 4-year secondary course leading to School Certificate for about 10 per cent of the intermediate output.

Progress up to the end of 1958 has been quite spectacular, with a primary enrolment representing over 80 per cent of the potential intake, an intermediate enrolment of 25 per cent, and a secondary enrolment of over 11 per cent, the latter schools having entered over 600 Africans for School Certificate at the end of this period.

Wastage, which was hitherto one of the major bugbears of the African system, has been greatly reduced and the Government's present aim is to provide the first eight years of education on as universal a scale as funds permit. At present therefore the only major difference between the

African system and that followed by the other racial groups is that the 8-year course is divided into two 4-year courses, known as primary and intermediate. Another difference is that the African primary/intermediate course at present takes 8 years as against 7 for the other races. It is expected, however, that the introduction of better qualified teachers and the greater attention given to the teaching of English in the earlier years will gradually eliminate this difference of duration.

Asian. The first Asian school was opened by the Uganda Railway Authorities in 1906 and was taken over by the Government in 1912. During the greater part of the period under review Asian education was organized under an eight-class system (six regular standards preceded by two sub-standards), followed by a three-class secondary system. At the end of the first year, secondary pupils sat for the Cambridge Junior Certificate, which was a requirement for further promotion. The Junior Certificate was abolished in 1945, and the present pattern of seven years primary followed by four years of secondary education was instituted shortly thereafter.

In 1950 an advanced course of 2 years leading to the Cambridge Higher School Certificate was introduced for selected pupils in one school. This course is now available in two boys' schools and one girls' school.

In 1958 a 2-year secondary modern course was introduced in most secondary schools and at the top of certain primary schools to cater for pupils whose abilities and aptitudes were considered unsuited to the formal academic type of secondary education.

European. Up to 1930, the primary schools included additional secondary classes up to the level of the Cambridge Junior Local Examination, but in 1931 all pupils who had completed the normal primary course were transferred to Nairobi to the first separately organized secondary schools, one for boys and one for girls, the latter sharing buildings with the Nairobi Primary Mixed Boarding School. There are now two boarding schools and one day school for boys, and equal provision is made for girls.

In 1932 the first class beyond the School Certificate stage was established at the Prince of Wales Boys' School. Although the European secondary schools have always provided instruction in practical subjects, in recent years facilities for woodwork, metalwork, and the various branches of home crafts have been gradually improved, so that 'modern' classes formally exist in all the schools.

Administration

The policy governing the organization, content and expansion of education is formulated by the Minister, with the professional advice of the Director of Education and the Advisory Councils, one each for African, Arab, Asian, European and Goan education, higher education, and technical education and vocational training.

The Director of Education is responsible for the execution of policy, and he is assisted in the planning and administration of education by five assistant directors. An Assistant Director is in charge of the planning and organization of secondary schools for each of the three racial groups—African, Asian (including Arab and Goan) and European. A fourth Assistant Director is responsible for the administration and planning of Technical and Trades Education, and a fifth is responsible for advising on the education of girls.

The Chief Inspector of Schools, advised by Syllabus Committees and a number of specialist staff, is in charge of curricula and examinations. However, most examinations given in secondary schools are set by public examining bodies in the United Kingdom, a situation which has a strong bearing on the curricula followed in the schools.

Control. A small number of government schools and training institutions which draw their students from more than one province are administered directly from the headquarters of the Department, and the only private European secondary school has its own Board of Governors. The heads of all other government European and Asian schools come under the control of the Provincial Education Officer, who is the local representative of the Director of Education.

Asian private schools, the majority of which are government-aided, also come under Provincial Education Officers, but have managers who are responsible for all matters of organization, the head of the school being in charge of all academic matters.

The control of African secondary schools is organized somewhat differently in that they are grouped by provinces under Regional Boards, of which the Provincial Education Officer is executive officer. Most of these schools also have their own boards of governors.

All schools and colleges conducted by voluntary agencies are owned and run by managers approved by the Minister, and all are required to be registered by the Education Department and are subject to official visits and inspections. The great majority of such schools at secondary level receive financial assistance towards teachers' salaries and are eligible to receive grants towards the cost of capital development. The fees they charge, the staff they engage, and their curricula are subject to the approval of the Department.

Supervision and inspection. The Chief Inspector of Schools is responsible for the academic standards of schools and all matters affecting their curriculum, including the selection and supply of textbooks and the production of syllabuses. He is also responsible for all examinations organized by the Department and for matters arising out of overseas examinations.

The staff of the Chief Inspector of Schools includes three specialist supervisors, for domestic science, physical education and English. The Chief Inspector of Schools is also concerned directly with the inspection of secondary schools.

The staff of the inspectorate is usually recruited from the government teaching service; professional qualifications and considerable teaching and administrative experience are required.

Parents' committees have been set up for individual schools or groups of schools of all races and, while they have no statutory powers, they provide a link between the parents and the management of the schools.

Finance. All government funds for secondary education are allocated by the Treasury of the Central Government to the Ministry from the general revenue of the Colony.

In the case of government schools of all races, funds are distributed by the Ministry directly to the schools in accordance with their approved annual estimates of expenditure. Grants-in-aid to aided Asian and European schools are paid direct to the managers of the schools against claims for salary grants which are checked and passed by the Education Department. The grants are paid at the rate of four-fifths of the approved staff salaries.

Aided African secondary schools are financed by Provincial Education Boards from an annual government subvention based on approved expenditure. The majority of grants are paid according to a budget calculated to meet the difference between approved expenditure and the estimated revenue, from fees. Such grants are conditional upon a board of governors or a school committee being in charge of the school management. Schools are free, however, to maintain their managerial autonomy, in which case they receive capitation and salary grants.

School fees are fixed by regulation in all government schools and are payable by all pupils, except in cases of indigency where, in Asian and European government schools, partial or total remission of the fee may be granted on the recommendation of the school committees. In aided schools for Europeans and Asians, school fees are fixed by the managers but are subject to the approval of the Director of Education. Parents of pupils in African secondary schools who cannot afford to pay the fees are assisted in part or in full by the African District Council.

In government schools the cost of all new buildings and equipment is met from the development funds of the Central Government. These funds are also made available to aided European and Asian schools, which receive grants amounting to 50 per cent of the cost of approved new buildings and equipment. Similarly, capital grants are made to African aided secondary schools, but in their case virtually 100 per cent of the cost is met from government funds.

Buildings and equipment. The following requirements are laid down under the Education Ordinance, 1952:

No room used as a classroom shall accommodate in single-seat desks a greater number of pupils than the number produced by the following calculation

$$\frac{\text{area of room in square feet} - 140}{11.3}$$

No room used as a classroom shall accommodate in double-seat desks a greater number of pupils than the number produced by the following calculation

$$\frac{\text{area of room in square feet} - 140}{8.5}$$

No room used as a dormitory shall accommodate a greater number of pupils than the number obtained by dividing the area of the floor in square feet by 40.

The ordinance also lays down detailed requirements for lighting, ventilation and sanitation.

TYPES OF SECONDARY EDUCATION

The following are the broad types of secondary education:

Grammar schools. These are provided for all racial groups and are available to both boys and girls; they are not usually co-educational. Courses are available for the Cambridge School Certificate (4 years) and in a limited number of schools for the Cambridge Higher School Certificate (2 years after School Certificate).

Secondary technical schools. These exist only in the African and Asian (including Goan and Arab) groups. The 4-year course leads to the General Certificate of Education (Ordinary level) of the Associated Examining Board in either technical or commercial subjects.

Secondary modern schools. These are common to all racial groups except African. They are available for both boys and girls and are designed to meet the needs of pupils who are not suited for a full grammar or technical course. The course is at present of 2 years' duration and consists of general education with a practical bias towards technical, commercial or domestic science work. A Leaving Certificate is awarded on the conclusion of these courses on the results of an examination conducted by the Education Department.

Trade schools. These exist only for African boys. They all offer a 4-year course in a wide variety of trades.

Teacher training colleges. For Africans there is a 2-year post-primary teacher training course.

Selection of pupils for admission is based on the results of the Primary Schools Leaving examination, on the reports of primary school headmasters, and on age. Provided a pupil achieves sufficiently good results, he or she is free to choose any type of secondary course available.

Types of further education open to secondary school leavers include: degree courses and professional courses overseas; degree courses and professional courses at Makerere College, Uganda, and the Royal Technical College, Nairobi; courses at the Technical Institute, Nairobi; teacher training courses; training schemes run by government departments.

The secondary school year, which starts in January, is divided into three terms, the opening and closing dates varying slightly from year to year. In 1959 they were: 1st term, 12 January to 26 March; 2nd term, 27 April to 8 August; 3rd term, 7 September to 5 December.

The normal school week is from Monday to Friday inclusive and working hours are on the average from 8.30 a.m. to 4 p.m. Periods usually last for 45 minutes and there are breaks at mid-morning and for the mid-day meal.

General secondary schools

Pupils admitted to African schools proceed without further formal selection up to the School Certificate examination after a 4-year course. In the schools for all other racial groups, however, the first year in the secondary school is treated as a diagnostic year and pupils who are initially

placed in grammar or modern streams may, during the course of or at the end of the first year, be transferred from one to the other in the light of their aptitudes.

Those pupils who pass the School Certificate sufficiently well to show that they will profit from a further two years' secondary education are admitted to the Higher School Certificate classes where some degree of specialization is permitted.

The aims of these secondary schools are to provide the basic formal education which will qualify pupils for entry to institutions of higher education or for further training or employment on completing their secondary courses.

Owing to the large number of racial groups for which secondary education must be provided and the multiplicity of vernaculars spoken amongst these racial groups, the subjects taught vary considerably in the different schools. For example, within a single secondary school Asian pupils may be taking either Gujarati, Hindi, Urdu or Punjabi in addition to English. The submission of sample time-tables would, therefore, tend to confuse rather than to clarify the situation.

The subjects taught are as follows.

Grammar schools. Schools of all races: English, history, geography, mathematics, physics, chemistry, biology, zoology, domestic science,[1] economics, art, physical education. African and Arab schools: Swahili,[1] Arabic.[1] Asian schools: Hindi,[1] Punjabi,[1] Gujarati,[1] Urdu.[1] European and Asian schools: Latin, French. European schools: Spanish, German, Greek, Afrikaans.[1] Asian schools: health science.[1]

Secondary technical schools. First year: English, chemistry, physics, mathematics, history, geography, art. Second, third and fourth years: mathematics, English, physics and chemistry (as one subject), history or geography, and *either* metalwork, woodwork, and technical drawing, *or* book-keeping, typewriting and shorthand.

The subjects taught in the second, third and fourth years are taught up to School Certificate and General Certificate of Education (Ordinary level).

Secondary modern schools. English, mathematics, geography, history and *either* woodwork, metalwork, and technical drawing, *or* book-keeping and typewriting, *or* domestic science and home nursing.

Since there are in Kenya no facilities for training European or Asian teachers for secondary schools, it is necessary to rely on overseas countries for such courses. From amongst young European and Asian men and women who have obtained the necessary basic qualifications locally, and from amongst qualified serving teachers, selections for the award of scholarships to the United Kingdom, South Africa, or Makerere College, Uganda, are made. The majority of the scholarships awarded are for university degree courses, post-graduate education courses, or special subject courses.

There are two centres in Kenya for the training of African teachers for service in secondary schools. African teachers are also trained in the Faculty of Education at Makerere College (Uganda). At the end of the 2-year course for the Intermediate examination, those who do not qualify for the degree course can take a 2-year course for the Diploma of Education. Scholarships for overseas study are also awarded to Africans.

In view of the inadequate supply of teachers, it is also necessary to recruit from overseas specialist teachers of English, science, mathematics, and domestic science.

African teachers are members of a unified African teaching service but the teachers of all other races are either civil servants (in government schools) or are employed by the managements of private schools.

The salaries paid to teachers in aided private schools are on the same scale as those paid in government schools.

In the African teaching service and in the government teaching service for the other races, all teachers have the opportunity of reaching the highest teaching and administrative posts through promotion, which depends on merit, experience, qualification and length of service. The normal age of compulsory retirement is 55 years. A considerable number of married women are employed on temporary terms of service.

Vocational and technical schools (Ministry of Education)

Industrial training. Since 1949 five government 'technical and trade' schools for African boys have been opened in the Colony and plans have been made for an expansion of the system. Boys are selected for admission on the results of the Kenya African Preliminary Examination (Standard 8). All five schools offer a 4-year course in carpentry, joinery and building, four offer 3-year courses for painters and tailors, and two give courses for general mechanics. The oldest established school (Kabete Technical and Trade School) also offers courses for farm mechanics, sheetmetal workers, plumbers and pipe fitters, electrical wiremen, fitters and turners, and shoemakers and tanners. Additional courses are being provided at other schools as capital funds become available.

All students serve a three months' probationary period at the end of which they are indentured for a three or four-year period. Each apprentice is issued with a kit of tools appropriate to his trade; the kit is on loan whilst he is under training but becomes his own property when he successfully completes his course.

On four days a week practical craft training is given in the school workshops supplemented by teaching in elementary technology and trade theory. One full day per week is allocated to general education in mathematics, English, civics, drawing and elementary science.

The basic practical training in the workshops is supplemented by extra-mural training, mainly in connexion with school building projects thus, enabling the builders, carpenters, painters, sheetmetal workers, plumbers and electrical wiremen to obtain experience under normal working conditions.

The object of the courses is to produce artisans capable of bringing the advantages of their training to the industrial enterprises where they are employed. On completing the course, each student is given a Leaving Certificate which records the trade skills he has been taught and gives an assessment of his competency. In addition, all students take the lowest of the official trade tests which are administered by the Labour Department. After suitable experience in industrial employment, the artisan may attempt the

1. Taken only up to School Certificate standard; others may be taken to Higher Certificate level.

higher trade tests. A number of tailors, shoemakers and others, on completing their training, set up small businesses in their home districts.

The heads of the schools maintain close liaison with employers and with the Labour Exchanges throughout the Colony. In some cases, arrangements are made, in consultation with employing firms, for students to be given specialized training during their final year.

An on-training scheme has also been devised for building students with the object of training them to operate as petty contractors in their home districts. Teams of eight students are given loans to purchase building equipment and are engaged as labour contractors on school building projects. The operations are supervised by the staff of the technical and trade schools and the teams are taught how to organize site works, estimate quantities and the cost of the work undertaken. The object is to provide the teams with equipment and allow them to accumulate some working capital so that they will be capable of independent operation.

Wherever possible, students are placed with firms who have established apprenticeship schemes, and in such cases they are allowed credit for their school training.

A small number of students are selected, after two years of trade training, for entry to teacher training centres for training as handicraft teachers in the intermediate schools.

Secondary technical schools. There are two maintained secondary technical schools for Asian boys and one grant-aided school. Admission to these schools is by selection on the results of the Kenya Asian Preliminary examination. All students take a common first-year course in mathematics, English, science, history, geography, drawing and some craft work. On the results of the first year's work, they are placed in one of two streams, one group taking general subjects (mathematics, English, science, history or geography) and technical subjects (metalwork, woodwork and technical drawing), and the second group taking commercial subjects (book-keeping, typewriting and shorthand) in lieu of the technical subjects. In two schools the 4-year course leads to the examination for the Cambridge Oversea School Certificate, and in the third school the aim is to prepare students for the General Certificate in Education (Ordinary) of the Associated Examining Board. On completion of the course students either proceed to higher education or take up employment with industrial and commercial firms.

A secondary technical section for African students was established at the Kabete Technical and Trade School in 1956. Students are selected by competitive examination from those who have completed one year of a trade course. The secondary course is of 4 years' duration and leads to the GCE (O) examination of the Associated Examining Board. Subjects taken in common are English, mathematics, geography and science. Engineering students take, in addition, engineering technology and practice and technical drawing; the building students take brickwork, plumbing, carpentry and drawing.

Technical institutes. One grant-aided institution offers full-time courses in the mechanical and electrical engineering trades. Students are admitted who have completed one or two years of an academic secondary course, and the 4-year course leads to the intermediate craft examinations of the City and Guilds of London Institute. This institute admits Muslims from any of the East African territories. The institute also offers part-time day release classes in the mechanical engineering trades for students of all races.

A comprehensive technical institute for students of all races will open in Nairobi in 1960. In the interim, part-time day release and evening classes have been arranged at a number of centres. The courses offer tuition facilities for post-primary school pupils in preliminary technical and commercial subjects and there is a post-School Certificate course leading to the oversea certificate examinations of the City and Guilds of London and the joint preliminary examination of the professional engineering institutions. Some evening classes in domestic science subjects have also been made available. With the opening of the Nairobi Technical Institute, a full range of part-time classes in technical, commercial and domestic science will become available to residents in the city area. Progressive courses will be organized leading to recognized examinations conducted by the overseas examining bodies, and some local certificates will also be issued. At some future date, residential accommodation will be provided and at this stage sandwich courses for students resident outside the city will be offered.

A full-time clerical training course of one year's duration is available for African students at the Kabete Technical and Trade School. The standard of entry has been raised and completion of a School Certificate course is now required. At the end of the course, students sit the Pitman's shorthand examination and certain examinations of the Royal Society of Arts.

Vocational schools (other government agencies)

Although some of the courses at higher levels are available for staff of all races, the predominant aim of these schools is to train African professional and administrative staff for the public service. The instruction is given in full-time courses, and whilst some of it is post-primary there is also an element of post-secondary training. Details of courses conducted at secondary level are given below.

Railway training school. Mechanical Department apprentices recruited at the post-primary level are required to undertake a five-year apprenticeship. During the whole of this period they spend one day each week at the Railway Training School where they receive instruction in English, arithmetic, elementary geometry, history, geography and current events, plus, in the first year only, first aid.

Trainee drivers receive five years' training, of which the first two are spent at the Railway Training School. Throughout the whole of the five years they are given general instruction similar to Mechanical Department apprentices.

There are shorter courses, almost wholly vocational, for permanent way staff and station and clerical staff.

Livestock improvement centre schools. Eight of these schools, each of which provides resident accommodation for 20 students, are being operated by the Department of Veterinary Services. The main object is to train suitable applicants for employment as Veterinary Scouts in the Department or in the veterinary sections of African District Councils.

The students entering the schools are required to have completed their primary education. The course is of 2 years' duration and covers all practical aspects of selective breeding, care and nutrition of dairy cattle. In addition, instruction is provided on the care and feeding of sheep and poultry.

Agricultural instructor training centres. The Department of Agriculture maintains four of these centres, situated at Siriba, Embu, Matuga, and Kapenguria. Only School Certificate level students are now accepted at Siriba for entry to the first year. At Embu all the students at the school are of School Certificate standard, but at the other two centres the standards are lower.

The 2-year courses at these schools include crop and animal husbandry, survey for farm planning, other agricultural subjects and a certain amount of mathematics. The curriculum includes a considerable amount of practical work which is carried out on school farms at each centre. These schools are administered by the Provincial Agricultural Officers, who also select the applicants for entry.

Farm institutes. It is the aim to have one of these institutes in each of the major districts of the Colony. They were first founded in Nyanza Province and originally the plan was that farmers wishing to undergo training would settle at the institute for one whole year, and would manage model holdings under guidance by qualified staff.

As it was not possible to have more than a limited number of holdings at each institute the output of trained farmers was necessarily small. It has now been decided to aim at training from 50 to 100 farmers at these centres in short practical courses of a few weeks' duration covering the needs of the farmers in the particular area, e.g., coffee planting in coffee areas and dairy farm husbandry in potential dairying areas.

These centres have become increasingly popular and are playing a notable part in the follow-up after land consolidation.

Medical training centre. The Medical Department gives training at secondary level to students who wish to make a career in the Department.

Health assistants (male only) are given nine weeks of lectures at the centre on hygiene, sanitation, and communicable diseases. They are then sent out to a district for 18 months to gain practical experience under the direction of a European Health Inspector. On their return to the school for a final 9-weeks' course of lectures, they take an internal examination.

Hospital assistants are recruited from male and female 'dressers' who have worked for at least six months at a hospital. They are given four years' training. After one year they take preliminary, and after three years the final examination of the Nurses and Midwives Council of Kenya, and are given the title 'assistant nurse'. After a further year's training they take the internal examination which qualifies them as 'hospital assistant'.

Dark room assistants are given a two-year training of lectures and practical work in the X-ray Department of King George VI Hospital.

Teacher training schools

There are no teacher training institutions at secondary level for Asians or Europeans, but in African education 'T3' teachers are accepted at teacher training colleges on passing the leaving examination taken at the end of the 8-year primary course. The course is of 2 years' duration and there are separate colleges for men and women, all of which provide boarding facilities. Of the total of 40 colleges at this level, six are maintained by the Government and the remainder by missions, with financial assistance from the Government.

The course aims to consolidate academic knowledge previously acquired and teach the principles of education and psychology. A strong emphasis is placed on practical teaching.

At the end of the 2-year course teachers in training are required to undergo both a written and a practical examination. The written examination is set internally by the respective colleges, but it is moderated by the inspectorate and a sample selection of scripts is also scrutinized. The examination in practical teaching is conducted by a panel consisting of an inspector, a member of the Provincial Education Officer's staff, and a member of the Delegacy, which is the co-ordinating body for standards of teacher training throughout the Colony.

The normal staff of a T3 Teacher Training College consists of two graduates, or two non-graduate specialists, for each class in training. In practice it is the aim to select as one of the two an expatriate graduate, the other being an African, not necessarily a graduate, but with specialist teacher training ability.

The tendency is to concentrate teacher training at this level in fewer but larger colleges, i.e., usually with not less than 10 classes. It is felt concentration will enable the most economic use to be made of the specialist staff available.

Out-of-class activities

Considerable importance is attached to the participation of pupils in the running of the school, and the prefect system is encouraged in all schools. To enable the best results to be obtained from the system schools are divided into 'houses'. Within these 'houses' most of the day-to-day discipline and organization of extra curricular activities are the responsibility of prefects under the general supervision of housemasters.

A wide variety of school games are played. Teachers are encouraged to coach their pupils and contests between various schools are a regular feature of the school year and arouse great enthusiasm. Regional championships are arranged and annually a triangular athletics match is held between the leading African, Asian and European schools. The most popular school games and sports are association football, cricket, volley ball, basket ball, rugby football, tennis, swimming, athletics, hockey.

In every school and more particularly in boarding schools there are numerous cultural clubs and societies which are encouraged by the staff. The range includes literary, debating, dramatic, scientific, choral and musical, natural history, art, photography and gardening clubs.

The activities of the Boy Scouts and Girl Guides movements, the Red Cross Society, the St. John Ambulance Brigade, Young Farmers Clubs, and many other groups are enthusiastically supported in schools of all races.

TRENDS AND PROBLEMS

The most formidable problem facing the Ministry is that of finance. Kenya is a relatively poor country and the revenue is strictly limited. Accordingly the rate at which expansion and improvement of the present system can be achieved is controlled first and foremost by the funds which can be allocated to the Department. The expansion of the educational system is planned in three-year development periods and particular attention is being paid during the current period to the provision of accommodation, practical teaching facilities and staff for the recently introduced secondary modern courses in Asian and European schools.

These secondary modern classes are, at present, of two years' duration and the comparative shortness of the course is due to the late age at which pupils, particularly Asians, have in the past left the primary schools. Measures have been introduced to reduce the primary school leaving age to about 12 years so that the secondary modern course may be extended to three years and may yet be completed by pupils before they reach the statutory school leaving age of 15 years.

The secondary modern course is not designed to give technical or vocational qualifications. Rather it is intended to provide a level of general education which will enable the school leaver to profit by technical or vocational courses provided by government training schemes, commercial concerns and the Technical Institute. Accordingly much importance is attached to the extension of these post-school training facilities.

It has been mentioned earlier that Higher School Certificate courses (fifth and sixth secondary years) are conducted at a limited number of secondary schools. It is the intention of the Education Department to increase the facilities for such courses as the necessary funds become available, since nearly all institutions for higher studies now insist on the Higher School Certificate as a qualification for admission.

Mention has been made of the various forms of management of secondary schools. Many schools, both government and aided, have been placed under boards of governors and it is probable that this form of management will be gradually extended. At the same time the possibility is being examined of creating for Asian and European teachers a unified teaching service such as that which already exists for African teachers. At present the terms of service enjoyed by teachers in government schools (who are Civil Servants) are more attractive than those which aided schools are able to offer to their staffs. In the interests of the educational system as a whole the terms of service should be the same for all teachers in secondary schools, whether aided or government.

STATISTICS

Population (mid-year 1958 estimate): 6,351,000.
Area: 224,960 square miles; 582,646 square kilometres.
Population density: 28 per square mile; 11 per square kilometre.

Summary of school statistics, 1953–57. In 1957 enrolment in all educational institutions, excepting adult education classes, totalled approximately 567,000 students, representing 9 per cent of the total population. The total enrolment represented an increase of 42 per cent over the 1953 figure. In 1957 almost 97 per cent of all pupils enrolled were in primary schools, about 2 per cent in general secondary schools and vocational training institutions, and under 1 per cent in teacher training schools and in special educational institutions.

The proportion of girls in primary schools in 1957 was 20 per cent compared with 26 per cent in 1953, in general secondary schools 35 per cent in 1957 against 30 per cent, while in secondary teacher training schools enrolment of girls rose from 455 in 1953 to 1,000 in 1957, so that the proportion of girls to total enrolment increased from 22 per cent to 30 per cent.

The number of teachers in primary schools in 1957 was 13,095, of whom 21 per cent were women, and the average pupil-teacher ratio in primary schools was 42 compared with 40 in 1953.

Total enrolment in general secondary schools increased by 33 per cent between 1953 and 1957 and the number of girls enrolled by 54 per cent over the same period. However, of total enrolment in general secondary schools, over 46 per cent of pupils were in Asian secondary schools and only 30 per cent were in African secondary schools, the remaining 24 per cent being in European and Arab schools. Vocational training was reported only for African boys and enrolment had risen from 1,039 in 1953 to 1,913 in 1957, an increase of 84 per cent.

Students in African and Asian teacher training centres increased from 2,038 in 1953 to 3,288 in 1957, a rise of 61 per cent. The number of students in institutions of higher education (Royal Technical College, Makerere

College and in foreign universities) was over 1,850 in 1957 compared with 860 in 1953, an increase of about 115 per cent. (See Table 2.)

Examination results in secondary education, 1953–57. The number of children of all races successfully completing their secondary education with the School Certificate examination rose by 89 per cent between 1953 and 1957. The number of Africans obtaining a secondary school certificate increased by 152 per cent over the same period. Of the total successful African candidates 6 per cent were girls in 1957 compared with only 3 per cent in 1953. In the Higher School Certificate examination there were still no African or Arab candidates in 1957. The number of Europeans and Asians obtaining certificates rose by 45 per cent compared with 1953, and the number of girls awarded Higher School Certificates by 43 per cent. Grade T2, T3 and T4 teaching certificates are awarded to African students. Data for recent years are incomplete, but in 1956 the number of T3 certificates awarded was 579 compared with only 251 in 1953. 98 T2 certificates were granted in 1956 compared with 72 in 1953. The proportion of successful women candidates in 1954 was about 20 per cent in T3 and T4 courses; more recent data are not available. The number of Asians completing teacher training was 109 in 1957 compared with 58 in 1953, an increase of 88 per cent. (See Table 3.)

Educational finance, 1956/57. Total public expenditure on education in the fiscal year beginning 1 July 1956 was 5,331,781 pounds sterling—approximately £0.85 per inhabitant. Of this sum almost 99 per cent (£5,273,601) came from the Central Government, £52,531 from the voluntary agencies and £5,649 from local authorities. Capital expenditure amounted to £459,749 or 8.6 per cent of the total. The distribution of recurring expenditure by level and type of education is shown in Table 1. Of this recurring expenditure 59 per cent was for African education, 20 per cent for Asian, 19 per cent for European and 1.4 for Arab.

MAURITIUS

THE EDUCATIONAL SYSTEM

Primary education although not compulsory is provided free in state and in aided primary schools. There are also unaided private schools which teach either the three R's or one of the principal Oriental languages spoken in the island.

At the secondary level education is not free, except for pupils who win scholarships at annual competitive examinations and for poor pupils whose parents (or guardians) pass a 'means test' held by the Assistance Department.

All schools, including those run by religious bodies, are open to pupils of all races and creeds. A few, where Chinese is the medium of instruction, are, of course, of interest only to Chinese pupils, and one school under the jurisdiction of the French Government prepares pupils for the *baccalauréat*.

The basis of the school system is a 7-year primary school, leading to secondary grammar school (5–7 years), technical college (3–5 years), central school (3 years), or 3-year continuation classes. A 3-year part-time apprenticeship course (evening classes) is run by the Central Electricity Board. Post-secondary education is provided at the College of Agriculture, the Teachers' Training College, the science extension classes, or any of the training courses (nursing, midwifery and sanitary inspection) given by the Medical Department. For other types of higher education students go abroad; six government scholarships are awarded each year (four for boys and two for girls) on the results of the Cambridge Higher School Certificate examination.

THE DEVELOPMENT OF SECONDARY EDUCATION

A *lycée* was founded in 1800 during the French occupation. In 1840 this became the Royal College, organized as an English secondary grammar school, and it remained the only government secondary school until a secondary school for boys was opened in Port Louis, the capital, in 1929.

Secondary education for girls was in the hands of the Loreto Order until 1951 when the only government secondary grammar school for girls, the Queen Elizabeth College, was opened.

A central school, mixed until 1959, and now for boys only, was opened in 1953, offering post-primary education of a more general and practical nature. A central school for girls was opened in 1959.

A technical college and trade centre giving a 3-year course, with a further two years for selected pupils, was also opened in 1959 in temporary premises.

Twenty schools provide post-primary continuation classes. After experiments made by the village councils, these classes were taken over by the Education Department. Science extension classes have been in existence for many years and give students the opportunity to do practical work in the evenings in order to prepare for their General Certificate of Education examinations both at Ordinary level and Advanced level and, if they so wish, for the university degree of Bachelor of Science.

The main event of these last few years has been the establishment in 1957 of a ministerial system which makes the Director of Education reponsible to the Minister.

Legal basis

The laws relating to education in Mauritius are set out in Education Ordinance No. 39 of 1957 amended by Ordinance No. 25 of 1958 and Government Notices Nos. 59 and 90 of 1958 and No. 39 of 1959.

Administration

Education is planned by the Director of Education, who works under the Minister. The Director of Education is assisted by a number of committees, i.e., the Education Board, the Youth Advisory Committee, the Students Advisory Committee and the Adult Education Committee, the School Furniture Board and the Cambridge Examinations Local Committee which discusses matters relating to this university's overseas examinations.

The three government secondary schools are under the direct control of the Director of Education. The aided and non-aided schools are autonomous under the general control of the Director of Education and are required to fulfil certain conditions laid down in the Education Ordinance.

Government and aided secondary schools are inspected by the Assistant Director of Education for Secondary Schools. The private schools are inspected by an Education Officer who is a university graduate with teaching experience. Laboratories are inspected, with particular reference to standard of equipment, by a science graduate. Some schools have parents' committees, but these bodies usually play only a minor part in the organization of school life.

Funds for education are obtained from capital funds and recurrent revenue.

The Government meets all expenses for the running of its three secondary schools and contributes 80 per cent towards the salaries of teachers employed in recognized secondary institutions.

New buildings and equipment are paid for from capital funds and maintenance and replacement from general revenue.

Except in the cases already mentioned, fees are charged in all schools.

An allowance of 25 rupees is paid monthly to the parties responsible for a scholarship-holder domiciled in Mauritius, and 65 rupees for those domiciled in Rodrigues.

Buildings and equipment. In new schools classrooms are 40 feet square; the window space is no less than 10 per cent of the floor area and 80 per cent of the window area can be opened. Old schools are very often below standard and private secondary schools are sometimes poorly lit and equipped. Schools which offer science for the School Certificate examination must have an approved laboratory with the requisite equipment.

School welfare services. On entering a government secondary school, pupils undergo a medical examination. They are also examined by the School Medical Officer in the course of their school career if the principal thinks fit.

TYPES OF SECONDARY EDUCATION

Secondary education is mainly of the grammar school type. Altogether over 70 schools, for the most part private, offer this type of education. The two government central schools provide a 3-year course with emphasis on homecrafts and handicrafts. The Technical College runs a 3-year course in technical or commercial subjects, and for selected pupils a further 2-year course.

At present there are 20 schools offering post-primary continuation classes, the majority in small localities. They provide a 2-year course beyond the sixth standard with a definite practical bias.

The dates of the three school terms in the government schools are decided by the Director of Education. Five floating holidays are also granted. The school week is five days and the school day usually lasts from 9 a.m. to 3.30 p.m. Aided and unaided schools organize their year as they wish, provided their arrangements are reasonable and approved by the Director.

General secondary schools

The only schools which do not prepare students directly for a career are the grammar schools. The government schools recruit their pupils on the basis of the results of an examination held each December; the aided and better non-aided schools usually hold their own entrance examinations. Many private schools appear to be run on a purely commercial basis and to accept practically all applicants.

In the government and aided schools, pupils are grouped in streams according to ability. The subjects taught include English, English literature, French, Latin, mathematics, history, geography, physics, chemistry, biology, art, physical training and music.

Teaching methods vary, but schools are encouraged to use such teaching aids as films, the radio, records, maps, to send their pupils out on excursions, to build up a well equipped library, etc.

TIME-TABLE FOR ONE OF THE ROYAL COLLEGES, 1959
(in periods of 45 minutes)

Subject	1	2	3	4	5	Lower 6th		Upper 6th

Religious instruction	1	1	1	1	1	1	1	1	1

Most government and aided schools give terminal reports and hold at least two examinations a year to test the pupils' achievements. Some schools give more frequent reports. Usually if a pupil has not reached the required standard by the end of a school year he is not promoted. On completion of their fifth year in an 'A' or 'B' secondary school (i.e., schools which fulfil certain requirements in staffing, building, etc.), pupils sit for the Cambridge School Certificate examination. Pupils of other private secondary schools sit for the General Certificate of Education examination. The government and the aided schools and a number of unaided schools also provide a Cambridge Higher School Certificate course.

Most of the staff in the government and the aided schools are graduates recruited locally or overseas. A few teachers with only the Higher School Certificate or an equivalent qualification are also employed in these schools, but usually on a temporary basis until qualified staff can be found. In unaided schools the staffing is generally of a lower standard, most of the teachers holding only the Higher School Certificate or often only the School Certificate.

Vocational and technical schools

Pupils for these schools are selected on the results of their sixth standard examination and their performance at an interview.

The weekly time-table at the central school for boys, in periods of 45 minutes, is as follows: English 5, French 4, mathematics 4, general science 3, social science 3, art 3, handicrafts 9, technical drawing 2, religious knowledge 1, and one period is devoted to film shows or talks.

At the central school for girls the time-table is on the same lines as that of the boys' school; the girls do four hours of needlework, four hours of homecrafts and two hours and forty minutes of light craft.

For the technical college pupils are selected on the results of the same examination as that by which candidates are selected for admission to the grammar schools. As already stated, the college is now providing a 3-year course, after which a selection will be made, the best pupils continuing their studies for a further two years. Subjects taken by the technical stream and the number of 40-minute periods per week are as follows: English 9, mathematics 9, history 3, geography 3, technical drawing 8, mechanics 4, physics 4. The commercial stream has English 7, mathematics 8, history 2, geography 2, book-keeping 7, shorthand 4, general science 2, typewriting 4.

Vocational training courses run by the Medical Department and the Central Electricity Board have been referred to above.

TRENDS AND PROBLEMS

The great problem of Mauritius is its over-population, and the education authorities are not in a position to offer a sufficient number of places in their secondary schools to satisfy the great desire for education which is sweeping the country. Unfortunately the greatest demand is for the grammar school type of education, which explains why so many private schools have sprung up in the last few years. The Department of Education is trying to raise the standard of these schools (their percentage of passes is often below 10) and also to limit their growth, since Mauritius can offer white-collar jobs to only very few of the pupils leaving the secondary schools.

In view of the crying need for technicians a technical college has been opened, which will be able to produce each year all the technicians the Island needs.

The lack of university graduates among the teaching staff in the private schools is also being partially remedied through the provision by the Education Department of science extension classes where students may prepare for the B.Sc. General degree of the University of London.

STATISTICS

Population (mid-year 1958 estimate): 603,000.
Area: 720 square miles; 1,865 square kilometres.
Population density: 838 per square mile; 323 per square kilometre.

Summary of school statistics, 1953–57. In 1957 enrolment in educational institutions at all levels excluding adult education courses totalled approximately 115,000 pupils, representing nearly 20 per cent of the total population. Of this total, nearly 89 per cent were pupils in primary schools and 11 per cent in secondary and teacher training schools. In addition, students at universities abroad increased from 263 in 1953 to about 400 in 1957, a rise of 52 per cent. The proportion of girls in primary schools was 44 per cent in 1957 against 42 per cent in 1953; in general secondary schools 32 per cent against 31 per cent in 1953 and in the teacher training college 45 per cent against 52 per cent in 1953. The teaching staff in primary schools numbered over 3,000 in 1957 of whom 55 per cent were women. In general secondary and teacher training schools, 34 per cent of the 647 teachers were women. Compared with 1953, enrolment in primary schools increased by 29 per cent in 1957. The average pupil-teacher ratio in primary schools was 34 in 1957.

The total number of pupils enrolled in general secondary schools increased by 60 per cent between 1953 and 1957 and the number of girls by 65 per cent. In the teacher training college, enrolment rose by 24 per cent and the number of women students by 6 per cent over the same period. The number of pupils in the central vocational school has fluctuated since its inception in 1955. In 1957 it had 67 students of whom 15 were girls. The average pupil-teacher ratio in general secondary and teacher training schools was 20 in 1957 compared with 17 in 1953. (See Table 3.)

Examination results in secondary education, 1953–57. The number of students obtaining the Cambridge School Certificate increased by 17 per cent between 1953 and 1956. Students awarded the Cambridge Oversea Higher School Certificate increased by 28 per cent over the same period. 52 students passed the final examination in teacher training in 1955. (See Table 2.)

Educational finance, 1956/57. Total public expenditure on education in the fiscal year beginning July 1956 was 19,113,520 Mauritian rupees, representing about 33 rupees per inhabitant. Of this sum, local authorities contributed only 0.1 per cent (19,927 rupees), the remainder coming from territorial revenues to the Central Government. Capital expenditure (4,461,011 rupees) was 23 per cent of the total spent. The distribution of recurring expenditure by level and type of education is given in Table 1.

SEYCHELLES

The Colony of Seychelles, with dependencies, comprises 92 islands and islets, the largest of which are Mahé and Praslin. The population is of African and European (mainly French) descent, and the languages spoken are Creole, English and French. The Governor is assisted by an Executive and a Legislative Council, the latter including elected members.

THE EDUCATIONAL SYSTEM

Although the Government is responsible for public education, the Education Department itself directly maintains only a few schools, its chief contribution to the provision of educational facilities being the generous financial assistance it gives to almost all the schools run by missions and the guidance and supervision it gives on matters pertaining to the secular curriculum. There are also a few unaided schools. The whole system is under the general control and supervision of the Director of Education, who is assisted by a supervising teacher, a visual aids officer, and a small clerical staff. An advisory council, made up of the heads of the local secondary schools, government officials, the heads of the Church of England and Roman Catholic missions and leading members of the community, functions as a consultative and deliberative body. Administration is governed by the Education Ordinances of 1944 and 1949, with amendments; detailed regulations under the ordinances are issued by the Governor-in-Council. It has not yet been found practicable to introduce compulsory education. Government expenditure on education is financed from colonial revenue supplemented by fees payable at secondary grammar schools and grants from the Colonial Development and Welfare Fund.

The basis of the school system is a six-year primary school (standards 1 to 6) which leads to secondary grammar or secondary modern school and to a limited amount of vocational and teacher training. There are no facilities for higher education. A number of scholarships are available for study abroad. All schools use English as the medium of instruction and teach French as a second language.

THE DEVELOPMENT OF SECONDARY EDUCATION

Two schools for boys, St. Louis College and King's College, were founded respectively by the Christian Brothers and by the Government in 1871 and 1891. The secondary department of the government school was closed in 1920 and St. Louis College, which had in the meantime been transferred to the Marist Order, was closed in 1946. On the withdrawal of the Marist Brothers the Government opened a school now known as Seychelles College and organized it along the lines of an English secondary grammar school. Since 1950 the college has been staffed by a French-Canadian branch of the Brothers of Christian Instruction of Ploermel.

The secondary grammar school for girls, Regina Mundi Convent, traces its history back to a school founded in 1861 by the Sisters of St. Joseph of Cluny, the Order which still manages the school. Seychelles College and Regina Mundi Convent are situated in Victoria, the capital, on the island of Mahé, but both schools have ample boarding accommodation for children from outlying parts of the colony.

Under a 10-year development plan initiated in 1945 provision was made for non-academic secondary education in modern schools. Two such schools were opened in 1949, one at Victoria and the second at Grand Anse, on the island of Praslin; the former has separate departments for boys and girls, the latter is co-educational except for practical subjects and physical training.

In 1947 the Education Department established the Government Trade Technical Centre, giving instruction in carpentry and related trades. Evening and day release classes in a few commercial subjects are also provided by the Department. A building development plan approved in 1957 provides for the rehousing of the Victoria Secondary Modern School and its reorganization and extension as a secondary modern technical school. Its facilities will be available for evening classes. Institutionalized teacher training began in 1955 with the opening of teacher training centres in Victoria which provide basic secondary education for pupil teachers and a series of 2-year sandwich professional courses for teachers holding the Cambridge Oversea School Certificate or some higher educational qualifications. The Seychelles Training College, a post-secondary institution, was opened in September 1959 with a staff of three to provide a 2-year teacher training course, with 15 students in each year.

The new secondary technical school is being planned for 1,000 students. But the first phase—the provision of workshops and the replacement of the present modern school—is not likely to be completed before 1961.

Administration. All schools and centres at post-primary level except the Regina Mundi Convent are entirely maintained by the Government. The secondary department of the convent, as an aided school, receives an annual grant sufficient to cover teachers' salaries and pensions and the maintenance of the building. The two grammar schools and the preparatory schools attached to them are fee-paying. A number of government scholarships and bursaries are awarded annually to primary school leavers, after a means test. The award of scholarships is limited to children who are under 12½ years of age; there is no restriction upon scholars as to what vocation they eventually adopt. Bursaries may be awarded to children of any age, at the discretion of the Scholarships and Bursaries Sub-Committee, but bursars are required to become teachers. The maximum award covers tuition, free books and free boarding or a maintenance allowance for a period of five years.

Tuition in all other post-primary institutions is free, and pupils in secondary modern schools receive free textbooks, stationery and materials. The Trade Technical Centre undertakes remunerative work for private firms and for the Government and is largely self-supporting.

Responsibility for secondary education policy and for general direction and supervision lies with the Director of Education.

TYPES OF SECONDARY EDUCATION

The grammar schools provide a 5-year course (forms 1 to 5) for pupils aged from 12 or 13 to 17 or 18. Entrants are selected on the results of an examination set and marked by the schools themselves and standardized for both schools. The Education Department reserves the right to scrutinize the papers and it re-marks the papers of applicants for scholarships and bursaries. The grammar schools curriculum includes English, French, mathematics, biology, physics with chemistry, history, geography, hygiene, music, religious knowledge and physical education; the girls' school also teaches domestic science, instrumental music, needlework, elocution and art. The course leads to the Cambridge Oversea School Certificate, and syllabuses in individual subjects conform to the requirements of the Cambridge Local Examinations Syndicate. For sixth form studies leading to the General Certificate of Education at Advanced Level, and higher education, Seychelles students now go to the United Kingdom, but it is expected that by 1963 a sixth form for boys will be established in Seychelles College.

Secondary modern schools provide a 3-year course (forms 1 to 3) for pupils aged from 12 or 13 to 15 or 16. There is no selection test, the normal requirement being that pupils shall have completed primary school and passed the standard 6 examination. Emphasis is on practical subjects such as woodwork, boat-building, basketry, net-making and shoemaking for boys, and housecraft, basketry and hat-making for girls. Other subjects taught include English, mathematics, French, history, geography, civics, nature study, hygiene, physical education and religious knowledge. Representatives of the missions have access to the schools for religious instruction. Leaving certificates are awarded, endorsed with the practical as well as the academic subjects in which the pupils have proved their efficiency.

Children admitted to the technical school at 12 or 13 will follow a 3-year orientation course in order to discover their aptitudes and abilities. It is estimated that probably half to two-thirds of them will show sufficient promise to enter the specialized courses at the age of 15 or 16. These courses will last 2 or 3 years, and half of each day will be spent in practical work. For boys there will be a choice of agriculture, navigation and seamanship, building trades, or electrical and mechanical engineering. For girls there will be a choice of housecraft, dressmaking, art and craft, pre-nursing and secretarial training. Throughout the school attention will continue to be given to the basic subjects.

The Trade Technical Centre offers a 4-year apprenticeship course in carpentry, cabinet-making and joinery, and has an annual intake of seven boys, the minimum entrance age being 15.

The Education Department provides general secondary education for student teachers who are below School Certificate standard. They attend on Saturday mornings and are prepared for the Cambridge Oversea School Certificate in English and arithmetic, and for a local examination of the same standard in French, history and geography. Other courses at the Teacher Training Centre are at professional (post-secondary) level. The Roman Catholic mission has a small *école normale* for girls who have completed primary schooling and wish to become pupil teachers. The school provides general education at junior secondary level.

There are evening classes in shorthand and typewriting for young people who have left school, and day release classes in English, shorthand, typewriting and book-keeping for civil service probationers.

Other forms of vocational training for young people include the Medical Department course for nurses and dispensers, and employment as juniors with the Public Works Department, the Government Printer and private firms. As yet, however, there have been no generally accepted schemes for the indenturing of apprentices and no special classes for apprentices other than those at the Education Department's Trade Technical Centre.

External examinations sat by students from any level or type of school in Seychelles are conducted by the Education Department. They include examinations for the Royal Society of Arts, the London City and Guilds Institute and the Australian Incorporated Society of Accountants, as well as the Cambridge Oversea School Certificate.

Out-of-class activities. The grammar schools and modern schools provide opportunities for the pupils to participate in team games and athletic sports. Other activities include debating clubs, correspondence clubs, dramatic societies, choirs, Boy Scouts and Girl Guides. Pupils in the grammar schools are divided into 'houses' and inter-house competitions of various kinds are held. The house system, the appointment of senior pupils as prefects or monitors, the wearing of badges and colours and similar practices encourage a sense of responsibility and co-operation.

Teachers. The principal teaching posts in the grammar schools are held by members of the religious orders running the schools and are recruited overseas. All these teachers have professional qualifications and half of them have university degrees. The secondary modern schools are staffed by lay teachers most of whom are recruited locally.

TRENDS AND PROBLEMS

In recent years there has been a steady increase in the number of pupils attending secondary modern schools. Improved communications in Praslin and Central Mahé are expected to augment the demands for places and there is already a need for schools of this type in South Mahé and on the island of La Digue. The progress made in secondary education and the increased numbers attending school have now made it possible to recruit pupil teachers entirely from the secondary schools.

As soon as it becomes practicable sixth form courses

will be offered at Seychelles College. It is hoped that with the improvement of primary schools the average age of pupils entering secondary schools will be lowered. At present the average of candidates for the School Certificate examination is 18, with the result that many of those who remain at school to complete this course are then too old for various apprenticeships, studentships and cadetships that would otherwise be available in Seychelles or overseas.

In technical and vocational education there is an acute need for the development of courses in agriculture, navigation, electrical, mechanical and building trades, and for secretarial, catering and art and craft training. The rebuilding and extension of the Victoria Secondary Modern School will be a step toward meeting these needs. The problem of providing further education for apprentices, including the provision of central classes in basic theory and techniques, is now under study.

[*Text revised by the Director of Education, Victoria, Seychelles, in August 1959.*]

BIBLIOGRAPHY

SEYCHELLES. DEPARTMENT OF EDUCATION. *Annual report.* Victoria, Mahé, Government Printer.

STATISTICS

Population (mid-year 1958 estimate): 42,000.
Area: 156 square miles; 404 square kilometres.
Population density: 269 per square mile; 104 per square kilometre.

Summary of school statistics, 1953–57. In 1957, 39 primary and general secondary schools, 1 public apprenticeship centre and 2 teacher training centres had a total enrolment of over 5,900 pupils, representing about 14 per cent of the total population. Primary schools accounted for about 91 per cent of the total enrolment, general secondary schools 8 per cent and teacher training under 1 per cent. Girls made up about half the enrolment in primary and general secondary schools, and nearly 90 per cent in the teacher training centres. Enrolment in primary schools increased by 8 per cent between 1953 and 1957, and the pupil-teacher ratio rose from 24 to 26. Women formed over 90 per cent of the teaching staff in primary schools in 1957. Total enrolment in general secondary schools increased by 40 per cent between 1953 and 1957 and the number of girls enrolled by 32 per cent over the same period. The pupil-teacher ratio in general secondary schools was 17 in 1957 and over half the teachers were women. Enrolment in the government apprenticeship centre was 17 in 1957, slightly lower than in the previous year. Enrolment in the teacher training courses rose from 25 to 35 between 1953 and 1957. (See Table 2.)

Examination results in secondary education, 1953–57. Successes in the Cambridge Oversea School Certificate increased regularly over the five years under review from under 10 in 1953/54 to 21 in 1957/58,; the number of girls awarded a certificate was 12 in 1957/58 compared with 4 in 1955/56. Results of the final teacher training examination are incomplete but six full certificates were awarded in 1956/57 of which four to women.

Educational finance, 1957. Total expenditure on education in the fiscal year beginning January 1957 was 923,026 Seychelles rupees, representing about 22.5 rupees per inhabitant. Of total receipts, 71 per cent came from territorial resources, 9 per cent from United Kingdom revenue, 15 per cent from voluntary missions and the remaining 5 per cent from the World Health Organization and the Cable and Wireless Company Ltd. Capital expenditure amounted to 117,032 rupees and represented 13 per cent of the total spent in 1957. (See Table 1.)

1. Including teachers of vocational training centre.
2. Including teachers of vocational and teacher training centres.
3. Vocational training also took place in the Medical and Police Departments; there were in addition part-time courses in shorthand and typewriting and classes in book-keeping for Civil Service probationers.
4. Teacher training was temporarily discontinued in 1954.

TANGANYIKA

Trust Territory

THE EDUCATIONAL SYSTEM

The plural society of Tanganyika, composed mainly of Africans but including a large number of Arabs, Asians and Europeans makes it advisable that the educational system should be organized on an ethnic basis. The system is affected also to some degree by the fact that the majority of schools of all types have been and are still being built by missionary organizations (although nowadays in most cases the building and maintenance of the schools are grant-aided by the Government), and are managed by these voluntary agencies under the guidance of the Government. The provision of education is no longer affected by any social factor. When the British Civil Administration took over control of the country in 1916, central schools were planned not only for selected boys of proved ability from the elementary schools of the district but also expressly for the sons of chiefs and sultans to fit them to fulfil efficiently their duty to the State and to their own people as leaders and educators. Selection in all post-primary institutions now depends upon performance only.

The 1957 census in Tanganyika showed a population of 8,788,466, including 8,665,336 Africans, 65,461 Indians, 20,958 Europeans, 19,100 Arabs, 6,299 Pakistanis and 4,776 Goans. The educational system is sub-divided into (a) African education, and (b) non-African education, which caters for the educational requirements of the European, Indian and other non-native children in the Territory.

In 1925, the Governor of Tanganyika publicly accepted the principles laid down in the London Advisory Committee's recommendations 'Educational Policy in British Tropical Africa', and the Government then undertook the responsibility of guiding the secular educational activities of the missions and of bringing them, as circumstances permitted, into conformity with a general educational scheme and approved standards of efficiency. From that date to the present time all educational institutions in Tanganyika, whether managed by the Government itself or by a voluntary agency, conform to a general policy under the direction of the Department of Education.

The role of public authorities and of private agencies. The Department of Education under the Minister for Education and Labour is responsible to the Tanganyika Government for the provision of education in the Territory.

District Commissioners are responsible (subject to the approval of the Provincial Commissioner of the Province) for the constitution and guidance of the Native Authority Education Committees which are composed of government, mission and local African representatives. These committees give advice concerning the desirability of opening or closing particular schools in the district, attendance of pupils, payment of fees and other points of local importance. It is intended that a steadily increasing degree of local responsibility and control in educational matters will be delegated to these committees in the future.

Recognized organizations, mainly missions, appoint, with the approval of the Director of Education, an Education Secretary to supervise the organization's schools and to act in liaison with the Director of Education, through their Education Secretary-General. The Education Secretary-General of the Christian Council of Tanganyika represents all Christian missions other than Roman Catholic, and the Education Secretary-General of the Tanganyika Catholic Welfare Organization acts on behalf of the Roman Catholic missions in the Territory.

European and Indian education is the concern of the European and Indian Education Authorities respectively. These are executive, not advisory, bodies of which the Director of Education is chairman, the members being nominated by the Governor or by the Minister for Education and Labour. Education for the other non-native (including Goan) section of the community is administered by the Director of Education with the assistance of an advisory committee, the members of which are appointed by the Minister for Education and Labour to represent the more important groups concerned.

The provisions of the Non-Native Education Ordinance govern the establishment and operation of schools for the education of children of the non-indigenous communities. In addition to prescribing the constitution and functions of the education authorities, this legislation provides for the appointment of managers of non-government schools, for the registration of schools and teachers, and for the inspection of schools.

THE DEVELOPMENT OF SECONDARY EDUCATION

General secondary education. No provision for general secondary education existed in Tanganyika until 1933. Accommodation for the small number of children able to proceed to such education was available in neighbouring territories. Thus, in 1932 five pupils were found places in junior secondary schools in Uganda with a view to their proceeding later to Makerere College.

In 1933 a junior secondary school course of two standards, 9 and 10, was established at Tabora Central School to take pupils as far as the level of the entrance examination into Makerere College. In this year also, junior secondary school classes had started at two mission schools, and five years later three government and two more mission schools extended their courses to include standards 9 and 10.

The outbreak of war in 1939 gave rise to a marked demand for a higher standard of education for candidates for the less remunerative posts in both government and native administration. African elders throughout the territory sent in appeals for higher standards of education particularly in English. In recognition of this need the status of the govern-

ment central school at Tabora was raised to that of a full secondary school.

During the war years the standard of entry to Makerere College was raised from standard 10 to standard 12, that is, to School Certificate level. By 1950, secondary education had advanced appreciably owing largely to the number of Education Officers recruited in the post-war years and the increased number of European staff available for the voluntary agency schools. The total enrolment in 1950 secondary classes was 2,248 divided almost equally between government and voluntary agency schools. In this year 43 candidates from the three senior secondary schools took the Cambridge Oversea School Certificate examination and 34 obtained certificates. In 1950, for the first time, Tanganyikan girls took the same standard 10 passing-out examination as was taken by the boys' secondary schools and in the following year the first Tanganyikan woman was admitted to Makerere College, after having taken her final two years of secondary school work in Uganda.

In 1959 there were 28 secondary schools, 12 of these being government institutions. Of these schools, 13 have standards 9 and 10 only, 6 have standard 11 and 6 have standards 9 to 12. The remaining 4 have standards 9 to 12 and, in addition, form 5, which is the first year of the Higher School Certificate course. The enrolment in the 56 streams of these secondary schools is 4,220 pupils, 421 of whom are girls.

By 1961 it is hoped that there will be 25 streams of standard 11 and 12 (as compared with 16 in 1959), and that the number of candidates for the Cambridge Oversea Certificate in that year will be over 500 as compared with 174 in 1958.

It is also hoped that after 1961 the number of candidates with Higher School Certificates will be sufficiently high to warrant that entry to Makerere College for government-sponsored candidates should be confined to those boys and girls possessing this qualification.

Secondary education in Indian schools was started during the period 1933–39 and a period of more rapid development followed the end of the war. Education up to School Certificate is provided at seven government schools and at seven assisted schools. The two largest government secondary schools offer higher School Certificate courses.

Secondary education for other non-native (including Goan) communities is available at four assisted schools and up to School Certificate standard at one school.

Secondary education in the Territory for European children is a comparatively recent development and followed the termination, in 1954, of the arrangement with the Kenya Government whereby Tanganyika children were admitted to Kenya Government secondary schools. St. Michael's and St. Georges' School, opened in January 1959, now provides full secondary education for European children.

Vocational education. Prior to 1914 a fairly extensive system of native education had been organized by the German administration and some six artisan schools had been established, in which a variety of trades were taught. At the beginning of the British occupation in 1916, it was found that educational organization had practically disappeared. A number of elementary and middle schools were established under native teachers; the middle schools were known as central schools and in these were organized all post-elementary school activities. These schools, in addition, to providing a further four years of primary teaching, also admitted boys who had completed the primary school course and indentured them as industrial apprentices for a period of three, and later of four, years. Improver's courses, combined with the work of junior instructors, were in operation in the schools with the object of continually improving the teaching personnel. All teaching was in the hands of native craftsmen and one Asian teacher.

By 1923, courses were being held in carpentry, tailoring, weaving, printing, welding and bootmaking. The tendency during the 1930s was to centralize vocational training, limiting it to urban schools only. In 1945 industrial training for Africans, mainly in carpentry, was being given in five government and five non-government schools, having a total enrolment of 316 boys.

The policy of trade training and technical education was changed in 1951 when the Government formulated schemes for this specialized branch of education. Trade training was to be carried out in specially built and equipped trade schools for African boys who had completed standard 8. The courses held in government and in voluntary agency schools, none of which had been of secondary standard, were gradually to work to a close.

Teacher training. Under the German administration in Tanganyika, boys who showed promise were drafted from their village schools to the nearest school conducted by a European headmaster. There they completed a course of 3 or 4 years' duration which included instruction in the local language and, this done, proceeded to Tanga to be trained as teachers and to undertake more advanced studies.

After 1916, the first normal class for the training of teachers was attached to the Government Central School in Dar-es-Salaam. Missions also trained their teachers, some by annual courses of about 3 months' duration, others by a full year's course. Two classes of teachers were trained, vernacular or grade 2 teachers, and English-language teachers, who were designated grade 1. The work was for the most part organized as a branch of central school activities although a few institutions actually were teacher training centres only and were unconnected with central schools.

In 1934 the standard of entry to both teacher training courses was raised by two years, grade 1 students being required to have a standard 10 qualification and grade 2 the Standard 6 Certificate, before being accepted for the course. Owing to the early age of marriage and the shortage of suitably qualified young women, it was not found possible, for some time, to insist on a similar standard of entrance for women students as for men, and, until the year 1953, on completion of their course the women took an examination of a lower standard than that taken by the men.

The standard required for entry to the grade 2 course has since again been raised and intending grade 2 teachers must now have a minimum qualification of Standard 8 School Leaving Certificate before being admitted. An increasing number of applicants for the grade 1 course now have the qualification of Cambridge Oversea School Certificate, although most grade 1 students are still selected on their results in the standard 10 examination.

The 1959 enrolment of grade 1 students in teacher training centres was 392, and 1,090 students were taking the grade 2 course.

An Asian teacher training centre was started in 1959 with an initial enrolment of 28 students.

The training of African domestic science specialist teachers was inaugurated in one government teacher training centre in 1952. Serving grade 2 teachers attend this 1-year course and then teach domestic science in girls' middle schools.

Courses of training as handicraft specialists or as agricultural instructors are available for serving men teachers.

Legal basis

The principal laws and regulations concerning education are contained in the Education African Ordinance and Non-Native Education Ordinance. No laws or regulations have been made which govern or bear on secondary education specifically. The following provisions refer to all schools, including secondary.

No school may be established or maintained unless (a) it is registered under the provisions of the Ordinance; (b) the owner of the school has been approved in that respect by the Minister and such approval has not been withdrawn; (c) the school is conducted either by the owner or by a manager approved in that respect by the Director of Education; (d) all the teachers employed at the school are registered under the provisions of the Ordinance.

Administration

The planning and policy of secondary education are the responsibility (a) for African education, of the Department of Education assisted by the Advisory Committee for African Education; (b) for Indian and European education, of the Indian Education Authority and the European Education Authority respectively; and (c) for other non-native (including Goan) education, of the Department of Education assisted by a representative advisory committee.

The curriculum of the secondary schools is drawn up by specially constituted panels under the guidance of the inspectorate. Considerable freedom is given to the headmasters and headmistresses of both government and voluntary agency secondary schools in their choice of textbooks, other than those actually set for the public examinations.

Supervision and inspection. Inspection of general secondary schools is the responsibility of inspectors attached to headquarters; their main duties are to inspect in secondary schools the teaching of the subjects in which they specialize, to keep under constant review the syllabuses in their subjects and to advise on books and equipment in regard to them. The inspectors are education officers, graduates of British universities and holders of diplomas of education, who have had wide experience of teaching at the secondary level.

The inspection of the teacher training centres is carried out by the Senior Education Officer in charge of Teacher Training, who is also responsible for the co-ordination of the work of teacher training throughout the Territory and for the review of syllabuses connected with it. The holder of this post is a graduate holding a diploma of education, who has had considerable experience of teacher training and of general educational work.

Finance

African education. African education is financed mainly from general revenue, although the native authorities make contributions, which are steadily increasing, towards the cost. In 1958 £2,619,072 was allocated to African education from Territorial Funds and a further £538,496 was made available from the Development Plan Reserve, the Custodian of Enemy Property Funds and the Colonial Development and Welfare Fund. The sum of £864,782 was contributed by native authority revenue.

In the case of the government post-primary schools, an allocation sufficient to cover the estimated expenditure for the year is made available to the headmaster or headmistress at the beginning of each financial year. Details of expenditure are submitted as required and more funds are made available throughout the year if necessary. In the case of voluntary agency schools a grant to cover the cost of provision and maintenance of school equipment and materials is paid by the Director of Education, through the Provincial Education Officer, to the managing agency.

A grant not exceeding 100 per cent of the approved expenditure on buildings and equipment is paid by the Director of Education to the managing agency, provided that the proposed school has been approved by the Director for inclusion in the development programme for that financial year.

Salaries of all teachers in both government and aided schools are paid by the Government.

All secondary schools are boarding establishments and a fee is charged to cover part of the cost of boarding and accommodation. Where payment of this fee would entail hardship for the parents, a remission of the whole or of part of the fee is granted. No fee is charged for tuition or for school equipment and the cost of the transport of pupils to and from school is also met by the Government.

Non-African education. Recurrent expenditure is met from the respective Education Funds (European, Indian, Other Non-Native), each of which derives its revenue from education tax, government school fees and a contribution from the Government.

Capital expenditure on government schools has been met from Custodian of Enemy Property Funds (for Indian schools) or loan funds and capital grants to assisted schools have been met from loan funds on which interest and sinking fund charges have been paid from the respective Education Funds.

Buildings and equipment. All general secondary schools have at least one laboratory which must have a minimum floor space of 1,000 square feet. The two girls' secondary schools have spacious, well-equipped domestic science blocks also. The other buildings for both secondary schools and teacher training centres include classroom blocks, dormitory blocks, a dining hall and kitchens, an administrative block, a library and usually an assembly hall. The buildings are all of a permanent nature usually with

concrete walls and tiled or corrugated iron roofs. The minimum requirements for the buildings are as follows.

The dining hall must allow 8 square feet per pupil, each classroom must be at least 27 feet by 19 feet and each dormitory must have a minimum floor space of 40 square feet per occupant and must allow for a space of 5 feet at least between the centres of each two beds. The area of windows and ventilators must be equivalent to at least 12½ per cent of the floor space.

School welfare services. Nearly all the secondary schools and teacher training centres are within easy reach of a government hospital, and the others are near mission hospitals. Free treatment is given to the students who are taken to the hospital when necessary, for treatment or examination. Many of the schools have a sick bay, and a qualified member of the staff deals with minor ailments. Students needing ophthalmic or dental treatment receive this free of charge from the government specialists.

TYPES OF SECONDARY EDUCATION

The primary schools in Tanganyika provide a 4-year course of instruction in the basic subjects. At the end of this course the children take an examination on the results of which selection is made for all middle schools of the Territory. Children who make satisfactory progress in each of the four standards (standards 5 to 8) of the middle schools, may at the end of their final year there apply to be selected for further training and they then take the General Entrance examination. On the results of this examination, pupils are selected by provincial selection boards for entry to secondary schools or to courses of training as grade 2 teachers, as male nurses or as craftsmen (the latter designation including bricklayer/masons, electrician/wiremen, plumber/pipe fitters, carpenter/joiners, painter/signwriters and engineering mechanics). Selection is also made for direct employment in the Tanganyika Subordinate Service as clerks or as agricultural instructors, or with the Police Force, the Forest Department, the Army, the Navy and the Prisons Department.

After the first two years in the secondary school (standards 9 and 10) selection again takes place, on the results of the Territorial standard 10 examination. A selection board meets and allocates places for standard 11 (in secondary schools), grade 1 teacher training, medical training, veterinary training, the clerical course, the survey course, the meteorological course, the Post Office Training School, the Railway Training School and for the Police-women Training Course. Boys and girls who are not selected for a course of training after standard 10 may apply for direct entry into various government departments, including the Labour Department and the Judiciary.

At the end of standard 12 boys and girls take the Cambridge Oversea School Certificate, and are then given places in the government department courses for further training according to their choice.

A great deal of help and direction is given to the pupils, in their choice of further training, by the headmaster or headmistress of the middle and secondary schools. A pamphlet 'Opportunities for further training, or employment with the Government' is put out each year by the staff of the Department of Education and circulated to all middle and secondary schools.

Very careful consideration is given to the selection of pupils for further training; in 1959 places in courses were found for 847 out of the 912 boys and girls who had been successful in the Territorial standard 10 examination, and every one of the 174 boys and girls who had passed the Cambridge Oversea School Certificate either began a further course of training or found direct employment with the Government or with reputable firms.

Organization of the school year. There are two terms in the school year, each of approximately four and a half months' in length. Subject to the Director of Education's approval, the actual dates are decided by the headmaster, headmistress or principal of the secondary institution concerned.

Lessons are given on five and a half days in each week although usually some time on Saturday morning is devoted to inspections and to recreational activities. Sunday is left free for attendance at church service and for reception of visitors.

General secondary schools

The schools whose principal aim is not to prepare directly for a particular career are known in Tanganyika as secondary schools.

Pupils are selected from standard 8 of the middle schools and are grouped into classes and streams according to ability or aptitude by the headmaster or headmistress.

The following subjects are taught in all secondary schools: English, Swahili, mathematics, science (physics, chemistry, biology), history and civics, geography, agriculture, physical education, handwork and art. At girls' secondary schools domestic science and needlework are also taught.

Achievement tests are carried out regularly but care is taken not to place unwarranted reliance on such assessments. Pupils receive annual reports on their academic progress, character and social value in the school. Promotion is decided by the headmaster or headmistress in consultation with the staff.

The recognized establishment for a single-stream boys' secondary school with standards 9 to 12 is three graduate and three non-graduate teachers; these may be either European or African and should each possess a diploma of education or a teachers' certificate. An instructor in art and handwork or in agriculture should also be attached to the school. Staff for secondary schools is recruited locally or from countries outside Tanganyika.

Vocational and technical schools

Trade training. Two trade schools have been established to provide trade training in the main trades associated with the engineering and building industries. These trade schools are situated respectively at Ifunda in the Southern Highlands Province, and Moshi in the Northern Province. They cater between them for students from the whole of Tanganyika. Each school is fully residential and accommodates 600 trade pupils, the intake in each school being 200 trade pupils per annum who attend for a 3-year course. The

minimum standard of entry is satisfactory completion of standard 8 and a satisfactory result in the General Entrance examination.

Students entering for courses associated with the building industry receive training in general building with specialized work in one of the following groups: carpentry and joinery, bricklaying and masonry, plumbing and pipe fitting, painting and signwriting, electrical installation.

Students recruited for courses associated with the engineering industry all receive a basic training during their first year in the following trades: welding, tinsmithing, blacksmithing, fitting and turning, auto-electrical work. During the second and third years of their training, the major portion of the time is spent in work in connexion with spark ignition and compressed ignition engines. They also study as a subsidiary trade one of the five trades listed above.

Theoretical studies in English, mathematics, technology, science and drawing as ancillaries to their particular trade are studied by all trade pupils. On the satisfactory completion of the trade school course all trade pupils are advised to enter a two-years' period of indentured apprenticeship in industry, during which period they receive further training. On the satisfactory conclusion of this they are awarded a Certificate of Apprenticeship.

In Dar-es-Salaam the first three phases of the Technical Institute are nearing completion. Further phases are planned to complete the institute, in which accommodation for 1,000 students will be available at any one time. If part-time day and evening classes and sandwich courses in addition to full-time courses are considered, it is estimated that some 2,500 students will attend in any one year.

This Technical Institute caters for both sexes of all races and is planned to meet the needs of the country for many years to come in providing facilities for education up to technician level in all branches of engineering, surveying, architecture, building, etc. Other sections will deal with domestic science, commercial subjects, etc.

The Technical Institute is planned to be the link between trade schools on the one hand and the Royal Technical College of East Africa on the other.

Agricultural and forestry. Training for employment in agriculture and in forestry is given at the Natural Resources School, Tengeru.

Boys holding the minimum qualification of the Territorial Standard 10 Certificate are accepted into the agricultural or Forest Department and, after either one or two years' experience in that Department, proceed to the Natural Resources School. Both the agricultural and the forestry courses are of two years' duration. The first year of each course includes instruction in English, mathematics, biology, civics, surveying and soil science, as well as the special subjects which apply to either agriculture or forestry. Practical work in the field is a feature of the course.

Teacher training schools

There are five centres where boys and girls are trained as grade 1 teachers to teach in the middle schools. Grade 2 teachers (for the primary schools) are trained in 23 centres, four of which are in the same institute as the grade 1 centre.

Candidates for grade 2 courses must hold the minimum qualification of a Standard 8 School Leaving Certificate, and for grade 1 must hold the minimum qualification of the Territorial Standard 10 Certificate.

The curriculum includes English, Swahili, general knowledge, general science, mathematics, education and teaching method. Girls' teacher training centres also include needlework in their curriculum.

An internal examination is held in each centre at the end of the first year of the course, and at the end of the second year the students take the Territorial examination, on the results of which Teachers' Certificates are awarded. Emphasis is laid on the great importance of practical teaching. The students have periods of practice in the schools during their course, and must pass in practical teaching, as well as in the written examination, to become eligible for certificates.

Members of the staff of the teacher training centres are graduates and non-graduates who hold a Diploma of Education or a Teachers' Certificate and who have had extensive and varied teaching experience.

Out-of-class activities

In practically all of the secondary (general) schools, the prefect system is in force and the school is organized on a house basis. In many also, the school council composed of representative pupils plays an important part in the school government. Every effort is made to foster in the pupils self-respect, initiative and a sense of responsibility.

Many social activities are organized and conducted by the staff and the prefects; and the pupils of a school, although of very many different tribes with varying cultures, traditions and customs, form a united and happy community.

Similarly in the vocational schools the students usually have class representatives and are encouraged to take an active part in the school government and to develop a sense of responsibility and a mature outlook.

Football is played enthusiastically in every boys' school, as is netball in each of the girls' schools. Hockey, volleyball and tennis are also played in some. Inter-school matches are held and matches against town clubs. Schools not only run their own Sports' Day and join in inter-school sports but also take a prominent part in the district and provincial sports and send competitors to inter-territorial sports meetings.

Other activities commonly found in secondary schools include debating societies, handicraft and art clubs, music and choral societies, school band, dramatic societies, social clubs, school magazine, Boy Scouts and Girl Guides.

TRENDS AND PROBLEMS

There is a decided need for expansion in all branches of secondary education in Tanganyika and this expansion is considered vital to the sound economic, social and political development of the territory. There are openings for more and better educated Africans in every branch of govern-

ment work, as also in industry and commerce. The standard of entry into most posts, as into most courses of training, is gradually being raised as a result of the increase in the number of applicants who can offer standard 10 or higher qualifications. It remains to be ensured that sufficient facilities for secondary education are available for all pupils able to benefit by them. At the present time, secondary school classes are not filled to capacity; but as the quality of children coming forward from the middle schools gradually improves, existing secondary classes will be filled and there will be need for expansion both as regards the number of secondary school places available and with regard to the general upward extension of the course to the Cambridge Oversea School Certificate level. It is hoped that in 1961 the number of streams in both standard 9 and standard 10 will have been raised to 56 and that in that year there will be 20 streams of standard 12, which will provide well over 500 possible candidates for the Cambridge Oversea School Certificate examination.

Higher School Certificate classes have been introduced into four senior secondary schools and it is hoped to make a significant increase in the numbers of these courses available in the future. Entry of government-sponsored candidates to Makerere College should, in the fairly near future, be confined to those who have successfully completed the Higher School Certificate course.

Consideration is also being given to the inclusion in the curriculum of technical and/or commercial subjects in selected secondary schools, up to the Cambridge Oversea School Certificate standard. It is realized that such a development would be of special value to students who wish to proceed to the Royal Technical College in Nairobi on completion of the School Certificate.

STATISTICS

Population (mid-year 1958 estimate): 8,916,000.
Area: 361,800 square miles; 937,061 square kilometres.
Population density: 25 per square mile; 10 per square kilometre.

Summary of school statistics, 1953–57. In 1957 there were about 423,000 pupils in schools at primary and secondary levels representing just under 5 per cent of the total population. In addition there were some 232 students from Tanganyika in institutions of higher education outside the Territory, principally at Makarere College, Uganda. About 94 per cent of pupils were enrolled in African schools, 5 per cent in Indian schools and under 1 per cent in European and other non-native schools. The proportion of girls to total enrolment in African primary schools, grades 1–4, was 32 per cent in 1957 compared with 30 per cent in 1954; in general secondary schools, including African middle schools, grades 5–8, African girls were about 17 per cent of the total enrolment and in teacher training schools 28 per cent. The average pupil-teacher ratio in primary schools was 55 in 1957 compared with 56 in 1953 and the proportion of women primary teachers to the total was about 15 per cent during the period under review. There was an increase in total primary enrolment of 43 per cent between 1953 and 1957 and the number of girls enrolled increased by 55 per cent over the same period.

Total enrolment in general secondary schools increased by 50 per cent between 1953 and 1957 and the number of girls enrolled by 56 per cent over this period. The pupil-teacher ratio in general secondary schools was 21 in 1957 and the proportion of women teachers 18 per cent. In vocational schools enrolment did not increase as steadily as in other fields, but in 1957 was 6 per cent above the level in 1953; girls formed about 7 per cent of the total. Total enrolment in the teacher training centres increased by 21 per cent over the period under review, girls enrolment increasing by 57 per cent. (See Table 1.)

Examination results in secondary education, 1953–57. The number of Africans passing the Cambridge Oversea School Certificate increased from 86 in 1953/54 to 149 in 1957/58 (73 per cent). The number of successful Indian candidates also rose over this period, from 97 in 1953/54 to 229 in 1957/58 (136 per cent). Two European and six Indian candidates were successfully presented for the Cambridge Higher School Certificate in 1957; there are as yet no African candidates. Africans passing the grade 1 and grade 2 teacher training examinations numbered 114 and 867 respectively in 1957/58. The number of grade 2 certificates reached a peak of 1,025 in 1955/56 and has since declined. (See Table 3.)

Educational finance, 1958. Total expenditure on education in the fiscal year commencing January 1958 amounted to

5,953,703 pounds sterling or about £0.7 per inhabitant. Of this amount, 51 per cent was contributed by the Central Government from Territorial revenue, 14 per cent came from native authorities revenue, 3 per cent from tuition fees, 5 per cent from non-native education tax, 16 per cent was derived from various development and loan funds including the Colonial Development and Welfare Fund and the remaining 11 per cent came from voluntary agencies. Capital expenditure amounted to £1,620,021 or 27 per cent of the total spent. (See Table 2.)

UGANDA

The African population of Uganda, making up about 98 per cent of the total, comprises representatives of various ethnic and lingustic groups. The tribes in the centre and south speak Bantu languages, while those in the north speak a series of widely differing languages belonging to the Sudaman, Nilotic and Nilo-Hamitic clusters. The principal non-African communities are the Asians (Indians and Goans) and the Europeans.

The Governor is assisted by an Executive Council and by a Legislative Council which includes representatives of the three main communities. For administrative purposes the protectorate is divided into four Provinces—Buganda, Eastern, Western and Northern—and each Province comprises a number of districts.

THE EDUCATIONAL SYSTEM

Historically the educational system grew up on a racial basis. In 1956 the Protectorate Government decided to develop common schools open to children of all races and denominations, and this policy is now being put into effect. However, for various practical reasons, the majority of the schools will, particularly at primary level, continue for some time to serve the children of the race for which they were built. English is the language of instruction for all junior secondary schools and senior secondary schools. The vernacular is used in the primary schools where English is taught as a foreign language. In the new common schools teaching is in English from the beginning.

The great majority of the schools are provided and managed by religious agencies—the Protestant and Catholic missions and, to a lesser extent, the Uganda Muslim Educational Association. There are also secular private schools. Although local authorities, i.e., the district councils acting through education committees, are taking an increasing part in educational administration and are now responsible for primary education in their respective areas, there are not as yet many local authority schools. The Government also maintains a small number of institutions, mostly at post-primary level—secondary, technical and teacher training schools. The principal contribution of the Central Government in the provision of educational facilities takes the form of granting financial aid to those voluntary agency, local government and private schools which meet prescribed standards. Thus monies spent on education come from five sources: protectorate government funds, local government funds, funds of the voluntary agencies, school fees, and community effort. By far the largest sum comes from the Protectorate Government.

In 1955, when a ministerial system was introduced for certain branches of government, education came under the

Minister of Social Services and later the Ministry of Education and Labour. The Director of Education, who is the head of the Protectorate Education Department, is responsible to the Minister for the administration and control of the educational system. He consults a number of advisory bodies, including an advisory council or committee for each of the racial communities. In addition to his headquarters staff, he is assisted by provincial and district education officers. The system is regulated by the Education Ordinance of 1959.

There is at present no legislation requiring compulsory school attendance.

The basic school system consists of a 6-year primary course leading to junior secondary school or to a farm school or a rural trade or homecraft school. Institutions based on the junior secondary school include senior secondary schools, technical schools, training colleges and vocational training schools run by other government departments. Higher education is provided in the Protectorate at the University College of East Africa (better known as Makerere College) at Kampala, and at institutions outside Uganda, particularly the Royal Technical College of East Africa at Nairobi in Kenya.

THE DEVELOPMENT OF SECONDARY EDUCATION

Secondary education was first started in the Buganda Province. Budo School, established in 1905, offered an advanced course from the beginning and may claim to be the first secondary school in the country, though Namilyango, founded in 1902, is the oldest of the schools now offering a full secondary education. The first training colleges, technical schools, rural trade schools and vocational courses were founded at much the same time. Progress was slower outside Buganda, but Busoga College, Mwiri, in the Eastern Province, originated as a high school in 1911. All these early institutions were provided by the missions. Girls' education lagged behind boys', and the first girls' senior secondary school, at Gayaza, was not opened until 1925. In the Northern and Western Provinces secondary education is of much more recent growth; in some areas it began only after the second world war.

Government participation in the provision and control of education, as distinct from financial assistance, began in the 1920s. A government technical school on Makerere Hill was opened in 1921 and a normal school (the first non-mission training college) in 1927. The Education Department was set up in 1925, following the Phelps-Stokes survey. As secondary schools in the territory developed Makerere College began to concentrate on post-secondary courses, and in 1928 its technical training courses were taken over by the government-owned Kampala technical schools. In 1938 the connexion of the college with the Education Department was severed and its subsequent evolution belongs to the history of higher education.

The first government Indian school was opened in 1932. Up to World War II Indian pupils went to Kenya or India for upper secondary education but there are now six Asian senior secondary schools providing the full School Certificate course.

In 1943, by agreement with the missions concerned, six secondary schools and two teacher training centres became self-governing institutions with boards of governors and received increased financial assistance from the Government. The principle of school management through boards of governors is now being applied as widely as possible. The Schools Government and Management Administrative Instruction of 1957 empowered the Director of Education to set up boards of governors for any school in the country.

In 1951 the East African Study Group, sponsored jointly by the Colonial Office and the Nuffield Foundation, investigated education in the British territories in East and Central Africa. In the following year the Uganda Education Department set up a committee, known as the de Bunsen Committee, to make recommendations for the protectorate in the light of the report of the study group. The committee recommended, *inter alia*, the reorganization and expansion of the system of teacher training, the expansion of secondary education and the improvement of its quality. New institutions included the Kyambogo Teacher Training College and the Domestic Science Training College. As regards senior secondary schools, the policy has been to expand and improve the equipment of existing institutions rather than to build new ones. Following the Harlow Report of 1951 an advisory council on technical education and training was formed, and the sum of £2 million was set aside from the African Development Fund to finance development in this field. Many additional opportunities, both for boys and girls, have been provided at post-primary level, including junior secondary schools, technical schools, rural trade schools, homecraft centres and vocational centres. An important development in technical education was the opening in 1955 of the Kampala Technical Institute.

The only schools in Uganda for European children are primary ones. For other types of education, European children are sent either to Kenya or the United Kingdom. To help parents whose children attend secondary boarding schools outside the territory, there is a system of government subsidies; the system also covers children of primary school age who live beyond the areas served by Uganda primary schools.

Administration. The headquarters of the Education Department is directly responsible for the planning and administration of senior secondary schools, training colleges and technical schools. Junior secondary schools are the responsibility of the provincial officers of the Department and of the voluntary agencies, and other post-primary institutions such as rural trade schools and women's vocational centres are administered by the local (district) education authorities. There is a Teacher Training Committee for the whole Protectorate and a Technical Service Committee. The Advisory Council for Technical Education has two committees, one for technical education and the other on apprenticeship. The former has various subcommittees which advise on courses for the individual trades or for a group of trades.

An important objective of policy is to increase the spirit of partnership in the administration and control of schools and to implement the administrative principle of 'self-governing institutions'. All government secondary schools, training colleges and technical schools, and most grant-aided schools at this level are now in this category. The

Administrative Instructions of 1957 require that the board, which must be representative of all parties concerned with the school, shall conduct the schools in accordance with the educational policies laid down by the Government through the Director of Education. The headmaster of the school normally acts as executive officer of the board; annual estimates have to be presented in the usual way; the accounts of the school have to be properly audited. Grant-aided secondary schools which are not self-governing are administered through the Educational Secretary-General for the Protestant or Catholic Missions.

Officers of the Education Department headquarters inspect the schools for which the central office is directly responsible, viz., senior secondary, technical and teacher training institutions. Inspection of the latter is carried out under the Assistant Director of Education (teacher training) and the Assistant Director of Education (women and girls), who is also a member of the Inspectorate; principals and staff have, however, a large measure of autonomy in organizing their work and assessing students. The central teacher training committees and the provincial committees furnish opportunities for professional co-operation and the exchange of ideas. Junior secondary, rural trade and housecraft schools are inspected by provincial and district education officers. The newly established Inspectorate is at present concentrating on junior secondary schools but will in due course extend its activities into schools at other levels.

The annual income of all government or grant-aided schools at secondary level is made up of capitation grants and school fees. The capitation grants range from £25 per annum for senior secondary boarding schools and training colleges to £2 per annum for a junior secondary day school. School fees are payable in all types of institution except training colleges. In African junior secondary day schools, the fees are about Shs.100/- per annum and in a boarding school Shs.350/- to Shs.400/-; in African senior secondary boarding schools, the fees are between Shs.400/- and Shs.600/-. All Asian secondary schools are day schools; the fees are Shs.252/- for junior and Shs.342/- for senior secondary classes. The Education Department disburses direct the funds available for them to senior secondary and technical schools and to training colleges. For other post-primary schools block subventions are paid to the provincial or local authorities who make the detailed disbursements.

All teachers, whether in government or grant-aided schools, are paid on the same scales and the full salary is paid from public funds, except in Asian grant-aided schools where the grant covers two-thirds of the salary. Regulations governing the employment of teachers have been codified and printed in the form of Teachers' Conditions of Service, together with a teacher's contract.

African secondary schools, training colleges and technical schools are usually built of permanent materials and the cost defrayed from public funds.

As boarding schools play a large role in secondary education, the provision of adequate meals has been a problem, the boarding fees being low in relation to costs. Through the work of the Education Department's adviser on school meals, standards in secondary schools and training colleges have been raised both as regards calorie content and variety of the diet.

TYPES OF SECONDARY EDUCATION

General secondary schools

Junior secondary schools. Children admitted to African junior secondary schools must have completed the 6-year primary course and passed the primary leaving examination. Admission to junior secondary schools is selective.

The junior secondary course aims at bringing as many pupils as possible up to the standard required for entry to teacher training colleges, technical schools and senior secondary schools, and at providing a sound and varied general education for those who will find jobs in industry, business or on the land.

The subjects in the curriculum are religious knowledge, English, mathematics, vernacular language, history, geography, general science, rural science, physical education, art, handicrafts, needlework, home economics, civics, music.

The length of the course is 2 years, though there is provision at some schools for an extra year. At the end of the second year the pupils take the senior secondary entrance examination and junior schools leaving examination. This certificate is a qualification for entry to training colleges, technical schools and the specialized courses run by the government departments.

Normally, the teachers in junior secondary schools have taken the grade 2 training course (see below).

The junior secondary course in the Asian school system was reorganized in 1956 and transferred to primary schools. It is a 2-year course and the aims and curriculum are virtually the same as those in African schools.

Senior secondary schools. Entrance to senior secondary schools is highly selective, and is based not only on the results of the senior secondary entrance examination but on a careful inquiry into the school records, character and academic potentiality of each child. The entrance examination, consisting of papers in English and mathematics, is marked by the staffs of senior secondary schools. A list of marks obtained by the candidates is sent confidentially to the senior secondary schools and final selection is made at a meeting of all senior school principals.

Senior secondary schools offer a 4-year course leading to the Cambridge Oversea School Certificate examination. The curriculum comprises English language, English literature, mathematics, general science, physics with chemistry, biology, history, geography, vernacular language, Latin, art, physical education, music.

The course aims at preparing students for the academic standard required for entrance to university or teacher training college or posts in the civil service, industry and commerce. According to the results obtained in the final examination successful students are awarded a grade 1, grade 2 or grade 3 certificate. Admission to the Makerere University College and the Higher School Certificate courses at selected schools is made on the results of this examination. Successful candidates for these institutions would normally have a grade 1 certificate and a high standard in the relevant faculty subjects. At the end of two years the Makerere students take the University of London Preliminary Examinations, and the school students the Cambridge

Higher School Certificate. Students can qualify for entrance to degree courses at Makerere on either of these examinations.

The aims and curriculum of the senior secondary course in Asian schools are virtually the same as those in African schools. African secondary schools are boarding schools and Asian secondary schools are day schools.

Most of the teachers in senior secondary schools have a university degree or equivalent diploma and professional training. Nearly all of them are from abroad—from the United Kingdom, India or Pakistan.

Vocational and technical schools

Rural trade schools. These provide a 3-year course of post-primary training in simple village crafts or agriculture. A maximum of 25 per cent of school time is spent on classroom instruction in English, arithmetic, drawing, and either the care and use for tools or aspects of crop and animal husbandry depending on the type of school. The village crafts schools concentrate on house building and furniture making, the agricultural schools on the cultivation of small-holdings, the rearing of poultry and cattle, etc. Up to now teachers have been recruited direct from trade courses in the technical schools and given vacation courses in the principles of teaching.

Homecraft centres and vocational centres for girls. Homecraft centres offer a basic 2-year course for girls leaving primary school. The curriculum emphasizes practical training in household management, child care, needlework, dressmaking, etc., but also includes English, arithmetic, religion and physical training. Two of these centres have been expanded into three-year vocational centres which train for the work of school matron and caterer and give more advanced courses in handicrafts and dressmaking.

Technical schools. These schools and the corresponding section of the Kampala Technical Institute offer 3-year courses in the following trades: brickwork, woodwork, motor vehicle maintenance, machine shop engineering, foundry work, plumbing and pipe fitting, electrical installation, boat-building, painting and decorating, shoemaking and tailoring. The educational requirement for entry to a trade course is three years of junior secondary schooling. Boys who have completed only six or seven years of schooling attend a 2-year pre-technical course provided at most of the technical schools; this comprises English, arithmetic, science, history and geography, arts and handicrafts. At the end of the three years' trade training, students sit for the Uganda Junior Technical Certificate, an examination conducted by a Technical Examinations Committee on which are represented the Missions, the Education Department, the Labour Department, the Assistant Establishment Secretary (Training) and the staff of the Technical Institute. Panels of teachers and trade testing officers conduct the practical examinations and also act as assessors. The Uganda Junior Technical Certificate is a school leaving certificate which serves to indicate to future employers the pupil's standard in the various subjects and to help select candidates for senior trade courses or technical teacher training at the institute; it is not a professional diploma. The 3-year trade course is normally followed by two years' apprenticeship, during which employers are required to allow apprentices time off for further technical education.

Kampala Technical Institute. The institute is composed of several schools and sections offering courses of different types and levels. At present these include junior trade courses similar to those described above, but it is hoped that all junior courses will eventually be transferred to the technical schools, so that the institute may undertake senior and advanced trade courses leading to the respective intermediate examinations of the City and Guilds of London Institutes. The following is a résumé of the various branches of the institute and their activities.

The School of Building and Civil Engineering. In addition to junior trade courses in woodworking, bricklaying, plumbing, etc., this school will offer in 1960 a 4- to 5-year course for building technicians. The course will be the 'sandwich' type, i.e., with alternative periods at the institute and in industry.

The Muljibhai Madhvani School of Commerce and Art offers several courses: one leading to the Intermediate Chartered Secretaries' or Cooperation of Secretaries' examinations; one in junior clerical training; courses in commercial arts and crafts, including painting and decorating. The school is also responsbile for the teaching of all the English and other liberal subjects throughout the institute.

The School of Mechanical, Electrical and Automobile Engineering provides 3-year courses in fitting, electrical work, and motor vehicle maintenance and provides training in welding, smithing, sheet metal work, foundry work and pattern making. In addition, it offers a 5-year sandwich course for electrical technicians.

The Science and Mathematics Section handles the teaching of these subjects in all courses. It also provides a 4-year senior secondary technical course leading to the General Certificate of Education at 'ordinary' level in science and technical options. A course for laboratory assistants is planned for 1960.

The Women's Studies Section is at present limited to a 2-year course in dressmaking.

The Technical Teacher Training Section admits students who have completed a junior trade course successfully. The students do one additional year of trade work, followed by nine to twelve months in industry and a final third year of teacher training.

Evening and part-time classes, both at the institute and elsewhere, offer recreational subjects as well as commercial and technical subjects. This branch is steadily expanding and in 1958 there were over 1,000 students attending some 83 classes at the institute alone.

Departmental training schools. Courses at secondary or secondary continuation level include the following:

Forest Department—Nyabyeya Forest School. A 2-year course for School Certificate students, including academic studies as well as practical and research work.

Department of Survey, Lands and Mines. (a) A 5-year course for School Certificate students leading to qualification as Assistant Surveyor or Surveyor. (b) Plane Tabler courses

for Junior Secondary III Certificate students; one year of class instruction leads to a first examination which is followed by two years' practical instruction in the field and a final examination.

Medical Department. (a) Medical assistants' course for Junior Secondary III Certificate students. The full course lasts 3 years; at the end of the second year students qualify as nursing orderlies and the best are selected for further training. Those successful in the final examination qualify as medical assistants. (b) A course for female nurses; three months' preliminary instruction (including English) is followed by three years' professional training. (c) Three-year courses for auxiliary staff—laboratory assistants, dispensers, assistant radiographers, health inspectors; School Certificate is required in all cases. (d) A 2-year course, based on Junior Secondary III Certificate, for hygiene orderlies.

Teacher training schools

Candidates are at present admitted to the teacher training colleges from primary class 6 for a 2-year pre-professional course, followed by professional training lasting two years, which prepares them to teach in primary schools. In one Province in 1958 all students, after eight years' schooling, were admitted for a 4-year course, and the raising of the minimum requirements for admission and the lengthening of the course will extend to other parts of the Protectorate in 1960. There are facilities for producing an annual output of 1,100 primary school teachers a year, and recent outputs have been about 1,000. Two domestic science training colleges, which admit students from junior secondary schools, run a 3-year course for the training of specialist teachers.

Students for the grade 3 course, which trains junior secondary school teachers, are required to pass the School Certificate examination. Most of this training is done at the Government Kyambogo Teacher Training College. The total output of grade 3 teachers is about 120 per year.

The Shimoni Training College prepares teachers for the six classes of the Asian primary school and the two junior secondary classes.

Diploma courses lasting 2 years are conducted at Makerere College for students who have completed two years' preliminary studies after School Certificate.

Senior tutors in training colleges are from abroad. They are on the Education Department establishment and have the rank of education officers; junior tutors are mostly grade 3 teachers. Teachers can rise from one grade to another, and the Department organizes courses and assists teachers to this end.

TRENDS AND PROBLEMS

The expansion of primary classes, with the resultant pressure upon junior secondary schools, has increased the need to provide more facilities at the post-primary stage for pupils who are unsuited for further academic or technical education. The main problem is the expansion and improvement of junior secondary education. The devolution of responsibility for these schools to provincial authorities and the improved quality of teacher training have enabled some progress to be made. At senior secondary level it is hoped to introduce shortly post-School Certificate studies which will dispense with the need for the pre-university course at Makerere College.

On the technical side, the main trends will be development of new technician and trade courses, a reorganization of commercial education, expansion of technical courses for female students, and the development of part-time education.

STATISTICS

Population (mid-year 1958 estimate): 5,779,000.
Area: 93,981 square miles; 243,410 square kilometres.
Population density: 61 per square mile; 24 per square kilometre.

Summary of school statistics, 1953–57. Excluding adult education classes and enrolment in Makerere College, enrolment in educational institutions in 1957 was about 468,000 pupils, representing approximately 8 per cent of the total population. Of the school-going population, 93 per cent were in primary schools, 6 per cent in general secondary schools and just under 1 per cent in vocational and teacher training schools. In addition there were over 900 students attending institutes at a higher educational level (including teacher training colleges and Makerere College), while the number of students in universities abroad was 800 as compared with only 61 in 1953. The proportion of girls in primary schools was 27 per cent in 1957 against 25 per cent in 1953; in general secondary schools 15 per cent against 19 per cent in 1953; in teacher training schools 35 per cent against 34 per cent in 1953. The teaching staff in primary schools numbered over 14,000 in 1957, of whom 21 per cent were women, while in general, vocational and teacher training secondary schools there were nearly 1,700 teachers of whom 17 per cent were women. The average pupil-teacher ratio in primary schools was 31 in 1957

compared with 29 in 1953. Compared with 1953 total enrolment in primary schools had increased by 50 per cent and the enrolment of girls by 60 per cent. Total enrolment in general secondary schools increased by 172 per cent between 1953 and 1957 and enrolment of girls by 115 per cent over the same period. Enrolment in teacher training (secondary level) increased by 42 per cent between 1953 and 1957. The average pupil-teacher ratio in all types of secondary school and including higher teacher training was 22 in 1957 against 16 in 1953. (See Table 2.)

Educational finance, 1956/57. Total public education expenditure in the fiscal year beginning 1 July 1956 was 4,928,404 pounds sterling, or approximately £0.9 per inhabitant. Of the total receipts 60 per cent came from the Central Government, 6 per cent from local authorities, 27 per cent from voluntary agencies and about 6 per cent was contributed by school fees. Capital expenditure amounted to 24 per cent of the total. Excluding expenditure for the central administration (£176,786) 80 per cent of recurring expenditure was spent on African education, 13 per cent on Asian, 6 per cent on European and about 0.55 per cent on Goan. (See Table 1.)

3. The output of teacher training colleges was reduced by reorganization of courses in 1955.

ZANZIBAR AND PEMBA

Zanzibar is a British-protected State under an Arab ruler. Arabs and Africans, amongst whom there has been much intermarriage, make up the bulk of the population; they were estimated at 280,000 out of a total of 299,000 in 1958. The remainder comprises mainly the Indian community, engaged chiefly in trade and commerce. There are also small communities of Goans, Parsees and Comorians.

THE EDUCATIONAL SYSTEM

Education in Zanzibar is largely the responsibility of the Central Government. The Arab and African communities were not attracted to the 'Western' type of education until the beginning of this century, being content with the traditional Koranic education. Christian and Indian communities, who started their own schools, remained outside the government school system and retained their independence to a very great extent. In recent years, however, because of increasing costs, all these schools have become grant-aided and in consequence now run on lines much closer to government schools.

There are few private (as distinct from grant-aided) schools in Zanzibar, the biggest of them being the Comorian School which is run with the help of funds supplied by the French Government. The others are mainly Koranic schools and nursery schools for children under the age of 6 who are too young to attend the government or grant-aided schools. A few secondary classes have been opened by private agencies recently to meet the unsatisfied demand for more secondary education.

The primary school course covers 8 years (standards 1 to 8). Children are admitted to standard 1 at the age of 6. It is therefore possible for the majority of children to finish primary and start secondary education by the age of 14. The various possibilities for secondary education are described below.

Kiswahili is spoken and understood by nearly all the people of the islands; it is the usual language of instruction in the lower classes of non-Indian primary schools. Arabic is spoken by relatively few people, even amongst the Arabs themselves, but it is the language of Islam and hence there is a strong demand, particularly from the Arabs, for the knowledge and use of Arabic to be increased. In order to satisfy this wish, Arabic is taught as a foreign language, with English, in all government non-Indian schools. The Indians speak mainly Gujerati among themselves and this language is used as the medium of instruction in most Indian community schools. English is the medium of instruction in the upper primary classes of all schools, and its use as such in all primary schools, both government and grant-aided, is increasing. All secondary education has always been conducted in English.

THE DEVELOPMENT OF SECONDARY EDUCATION

In 1920 there was one government school, Town Boys' School, which offered an 8-year primary course, with English as the medium of instruction in the last three years. It was considered then that several of the boys from the top standard of this school were suitable candidates for further education.

An education commission was appointed in 1920 to

revise the educational policy. The majority of members considered it too early to attempt any formal secondary education and plans were made instead to start a men's teacher training school, a commercial school and an industrial school for boys.

In 1924 the industrial school was started to provide training for carpenters, mechanics, tailors and bootmakers. Unfortunately the demand for these skills proved to be less than was estimated and the school closed down in 1932. The Public Works Department had already started apprenticeship training for carpenters and mechanics, and as it offered employment to its own apprentices after training boys leaving school were attracted to this scheme.

It was decided to open a secondary school for boys in 1935, replacing the commercial school; the new school provided a 4-year course, leading to the Cambridge Oversea School Certificate. In 1956 a secondary technical school was started to broaden the basis of the secondary education offered.

Girls' education lagged behind that of the boys. The first government girls' primary school was opened in 1927, and though wastage was too high at first to open classes beyond standard 5, an indenture system to train teachers was started in 1933. In 1944 a women's teacher training school was opened to provide a 2-year training course. In 1947 the Government Secondary School for Girls was opened.

The mission schools started post-primary education to suit their own requirements. St. Joseph's Convent School became a full-time co-educational private secondary school in 1947, and started to receive a grant-in-aid in 1954.

The Ismaili Khoja community started private secondary classes in 1940, and these became a full-time private secondary school for boys in 1947. This school (Aga Khan Secondary School) was also given a grant-in-aid from 1954 onwards, and became a co-educational school in 1959.

The provision of Higher School Certificate classes was the next advance. In 1959 classes at this level were opened for boys and girls in the Government Secondary School for Boys. The school moved into new and more commodious buildings in August 1958 and changed its name to the King George VI School in 1959.

Facilities for technical vocational training for boys were again made available when the Institute of Muslim Education was opened in 1950 at Mombasa. However, the cost became prohibitive and the Zanzibar Government decided to decrease the number of students going to Mombasa and to open its own trade school to provide training in the building trades. This school was started in 1956.

A dressmaking course for girls was started in 1953 and this was broadened in 1959 to include other domestic training.

Legal basis

An Education Decree was passed by the Legislative Council in December 1958 but it has not yet been put into force. Control of education, therefore, is by regulation only. Regulations controlling grant-in-aid to schools, primary and secondary, are contained in Sessional Paper No. 4 of 1955.

The Employment of Children, Young Persons and Adolescents Decree, 1958, allows part-time work under certain safeguards from the age of 12; full-time work, also subject to safeguards, from the age of 16. For the purpose of employment a young person becomes an adult at the age of 18 and can then be appointed on permanent pensionable terms.

The Apprentices Decree, 1926, makes provision for a child, with his parents' consent, to be apprenticed to a trade at the age of 9 for a period not exceeding seven years. This has not been a practice, however, for many years; the only boys who have taken out indentures have been over 16 and they have signed on as apprentices for a term not exceeding five years.

Compulsory education is not in force in Zanzibar. The suggestion for compulsory primary education was mooted recently for Zanzibar Town itself but the consequent cost precluded the possibility of that being enacted, even for such a limited area.

Administration

Education planning and policy is the responsibility of the Director of Education. In this he has the help of the Education Advisory Committee, a body composed of senior officers, and members of the public selected not only on their own qualifications but as representing the various interests involved.

Time-tables, syllabuses and choice of textbooks are the responsibility of principals of schools and individual teachers in charge of subjects. The block time-tables are examined by the Department to see that sufficient time is given to subjects not required for examination purposes to ensure that the pupils receive a broad cultural education.

Inspection of all secondary schools is the responsibility of the Assistant Director of Education and the Superintendent of Education for Women and Girls.

Finance. There are no local authority schools. Capital and recurrent expenditure for government secondary schools comes from central government funds, and is operated by the head office of the Department, which therefore is responsible for all accounting. Capital expenditure is derived mainly from both Central Government and Colonial Development and Welfare funds. For some of the larger projects generous public subscription has supplemented these sources.

Grants-in-aid to non-government schools are given in respect of two thirds of teachers' approved salaries, half the cost of passages of expatriate staff, and half the cost of approved alterations and additions to school buildings.

Fees are charged in all secondary schools but are equivalent to only a very small proportion of the total cost. In government schools, the present fees are Shs.300/- per annum, but in proven cases of hardship they are decreased. Boarding fees are charged but they are so low (Shs.120/- per annum) that they are held to be within the means of all but the most indigent and no remission is granted. The Social Welfare Department assists very poor parents with boarding fees if necessary. Fees are higher in the grant-aided schools, and remission may be derived from communal welfare funds.

Buildings and equipment. The standard of the building and equipment of government secondary schools in Zanzibar is high, and satisfies all regulations laid down as regards space, lighting, and sanitation. The classrooms are spacious and well designed for the hot climate, generally opening on to verandahs and balconies. The schools have well-equipped laboratories, well-stocked libraries, and various audio-visual aids.

The grant-aided schools are not so fortunate as regards accommodation; the greatest need is for good laboratories.

School welfare services. Arrangements are made for children in government schools to be medically examined and they are given free medical treatment at the government hospitals or clinics. Dentists visit the schools regularly and give free dental treatment. No special arrangements are made for grant-aided schools. The Welfare Department helps very poor children with uniforms, boarding fees and bus fares, but the numbers it is asked to help are small.

TYPES OF SECONDARY EDUCATION

The post-primary educational facilities can be summarized briefly: general secondary education; trade training in building (masonry and joinery/carpentry); domestic science courses for girls; primary teacher training for men and women; courses in Arabic and religious studies at the Muslim Academy. There are also private institutions which run commercial courses in English, book-keeping, shorthand and typing.

Entrants to all these courses except teacher training are selected from primary school leavers largely on the result of a general competitive examination held towards the end of the year. The examination subjects are English and arithmetic, and the head teachers' assessments and the pupils' school records are also taken into account. Pupils who qualify for places are asked to state their preference, and it is noticeable that secondary education is invariably the first choice; entrants to the vocational courses or to the Muslim Academy, therefore, do not come from the first flight of candidates.

The school year is divided into three terms, averaging 13–14 weeks in length. The daily session is from 7.30 a.m. to 12.45 p.m. on every day of the week except on Friday, the Muslim day of prayer, when classes finish at 12 noon, and on Saturday, when only a half-session is held. Pupils return to school in the afternoons for games and other school activities, and for special lessons when staffing and other factors so dictate.

The closing date of the secondary school year is dependent on the School Certificate examination dates. In arranging the preceding period of approximately 40 teaching weeks, the occurrence of the holy month of Ramadhan has to be taken into account. This moves forward about 10 days each year, and in consequence affects the relative lengths of the school terms. The other conventional vacations are in August and December.

General secondary schools

The government and grant-aided secondary schools all prepare for the Cambridge Oversea School Certificate examination at the end of a 4-year course. As has been mentioned previously, the boys' secondary technical school was established to widen the choice of subjects at secondary level, but although courses are conducted in woodwork, metalwork and technical drawing, the education is to be regarded as being of a general and not a vocational character.

Entry into the secondary schools depends mainly on the results of the competitive examination mentioned above, set by the Department of Education for all pupils who have reached standards 7 and 8 in either government or grant-aided schools. Entry to the examination from standard 7 is restricted to pupils specially selected by the teachers on grounds either of age or achievement. Unsuccessful entrants from standard 8 are allowed to repeat the year's work and make a second attempt provided they are young enough, but are handicapped on their second attempt to the extent of 15 per cent of the total marks. The handicapping is done in this way because children from the rural areas tend to start their formal education later than those in the towns, and because Arabs and Africans are usually at least one year older than the Indians in equivalent standards, having had to attend Koranic classes before starting the primary school course. Entry into the secondary course is restricted in all but very exceptional cases to those who will not have reached the age of 17 on 1 January of their year of entry. In awarding places, notice is also taken of head teachers' reports and pupils' records, and border-line cases are interviewed if it is considered necessary.

At present, about 20 per cent of the students leaving standard 8 annually are selected for secondary education but an increasing number of the specially selected standard 7 students are obtaining places and it is unlikely that the system of allowing second attempts in standard 8 will be continued much longer.

Secondary education in Zanzibar is inter-racial but there is a preponderance of Indians in all schools. In the grant-aided schools 95 per cent of the entry is Indian (including Goans) and in the government schools 47 per cent of the entry. The proportion of Arabs and Africans in all secondary schools amounts to 38 per cent (February 1959).

Curriculum. English, history, geography and mathematics are taught in all schools. Biology and physics-with-chemistry are taught in the two government grammar schools for boys and girls. General science and health science are the two subjects taught in the grant-aided schools, and physics-with-chemistry, but not biology, is offered in the government boys' secondary technical school. Language teaching differs from school to school. The Ismaili community, being a business community, provides teaching in commercial subjects, i.e., shorthand and book-keeping, in their secondary school. Technical drawing, woodwork and metalwork are essential subjects in the curriculum of the secondary technical school. All the schools except the Aga Khan School teach art. The girls' secondary school and the convent school provide domestic science classes.

A great deal of work has been done by the subject teachers of biology and geography to acquaint their pupils with the characteristics of their own local environment. The history syllabus includes a considerable amount of

local history, and historians living in East Africa, with the help of their university colleagues in the United Kingdom, are producing textbooks suitable for the Cambridge Oversea School Certificate course. A great deal of research is also being done on the teaching of English, and educationists in East Africa are working together to produce textbooks suited to East African conditions.

Teaching staff. The staffing of secondary schools is an ever-present problem. The supply of locally-domiciled graduate teachers is increasing slowly, but reliance has to be placed in the meantime on recruitment from the United Kingdom and India. It has not been possible to restrict staffs to graduates only; non-graduates have to be employed to fill certain vacancies. No training of secondary school teachers is carried on in Zanzibar; that is done at Makerere University College, Kampala (Uganda), or in the United Kingdom.

The Muslim Academy

This is a post-primary institution which offers tuition in Arabic and religious studies. It is not vocational, neither can it be termed a secondary school with all that that name implies. It was founded in 1952 in order to give opportunity for further education in Islamic studies to students who had had at least the background of a general primary education, and thus to produce young Muslims who would probably become teachers of and leaders in religion in the Protectorate. From that beginning has grown the proposal to expand the curriculum of the Academy to include more secular subjects such as English, Islamic history, geography, mathematics, so that the students may benefit from a blend of the traditionally Muslim and the more modern ('Western') concept of secondary education. Its courses may eventually be extended to higher studies in Arabic, history, and religion.

Vocational and technical schools

There is no technical school in the Protectorate. The boys' secondary technical school referred to above under 'General secondary schools' offers a course of general education rather than a course of vocational training. Some of those who have shown aptitude in their technical studies will be encouraged to go on to the Royal Technical College, Nairobi, for higher studies, but at the same time they will be eligible, with pupils from the other Protectorate secondary schools, to pursue the Higher School Certificate course in Zanzibar in either arts or science.

The Trade School. Now in its fifth year, the school provides training for the building trades only, and at present the teaching is confined to masonry and joinery. Pupils are selected from standard 8 and follow a 5-year course, which includes two years of training on the job. The course includes English and mathematics as well as the practical and theoretical work of the building instruction. After completing the course students will be employed by either the Public Works Department or by local contractors, or will be helped to set up on their own.

The Domestic Science School. The Domestic Science School has revived the art of joho- and bushti-making. These are very elaborate robes worn by Arabs over a plain white kanzu, and require a great deal of difficult embroidery in pure gold thread. In recent years the demand for these costumes has increased and they are now obtainable from the Domestic Science School only. Since 1959 the school has widened its course to include cookery, housewifery and laundry, and has included child-care and mother-craft as a preparation for marriage.

Technical training outside the Protectorate. For technical training in trades other than building, such as motor and radio mechanics, electricians' courses and welding, students go to technical institutes on the mainland, particularly to the Mombasa Institute of Muslim Education. The students are from standard 8 of the primary course, and normally follow a 4-year course in their respective trade which takes them up to about the level of the City and Guilds of London Institute intermediate examination.

Teacher training schools

There are two primary teaching training colleges, one for men and one for women. Each is admitting about 25 students a year; the students follow a 2-year professional course.

The men's college is residential and entry into the course is at two levels, from standard 10 (that is, after two years of general secondary education) or from standard 12, at the level of the School Certificate. A small but increasing number of students holding the Cambridge Oversea School Certificate is being admitted to the college.

The women's college is mainly a day training college and the entry is now confined to standard 12 students, most of whom have passed the Cambridge Oversea School Certificate. The students are trained to teach throughout the eight classes in the primary schools. They are divided into groups which specialize in either infant and junior teaching or the teaching of older children. The course is made as practical as possible. One day a week is devoted to domestic science training, which includes needlework teaching.

In both colleges all students learn how to make the main kinds of teaching aids. The students spend about six weeks a year on teaching practice.

Out-of-class activities

All secondary schools have a prefect system. Prefects assist with the discipline of the schools and undertake supervisory duties. There are also class monitors. In the boys' schools the house system is in vogue.

The boys' schools play a wide variety of games, and inter-school matches and athletic competitions are arranged.

Girls are handicapped by the purdah system but athletic sports and games are becoming more popular.

The Boy Scout and Girl Guide movements are active in Zanzibar and several companies are attached to schools.

In all schools and colleges there are flourishing debating societies, and clubs for those interested in art, geography, history, science, and natural history. Dramatic work is coming to the fore rapidly.

TRENDS AND PROBLEMS

The outstanding problem in Zanzibar is the usual one in underdeveloped territories of the lack of money to meet the increasing demand for more education. The main pressure at the moment is for secondary education.

The secondary education offered in the Protectorate is mainly of an academic pattern, and a fair proportion of the students admitted find the course quite beyond their ability. What is wanted is a wider selection of courses. Steps in this direction have been the development of the secondary technical school for boys, of domestic science teaching in the girls' secondary school, and the development of the Muslim Academy. One difficult obstacle is the relatively late start in formal education of certain students; many African and Arab students are 16 years old before they can compete for a place in a secondary school. By that time their minds are not as receptive as they were and there is a steady decline in their achievements as they proceed up the school. The Africans are in the minority to a marked degree.

This latter state of affairs was the subject of investigation by a special committee which produced a report in 1955 on the position of Africans in the education system of the Protectorate. The main conclusion of the report was that the dearth of Africans in secondary schools was evidently due to a combination of factors, mainly economic in character, which mitigated against the majority's staying the course in the primary school and, in the case of those who had done so, against their being able to compete on equal terms with others. This was held in some quarters to call for special concessions for Africans' education but this proposal was not accepted; it was not favoured by the Africans themselves. The eventual solution was considered to be the steady improvement of the Africans' standard of living and economic status, the basis of the physical and mental well-being of any community.

The expansion of the educational system during the last decade has been rapid, but unfortunately the rising costs thereby incurred have not been supported by a correspondingly buoyant economy. The revenue of the Protectorate, depending so much on the sale of the two native crops, cloves and coconut products, and on indirect taxation, is sensitive to a marked degree to the vagaries of world markets for these commodities. In 1958 a Committee of Education was set up under the chairmanship of the Chief Secretary to investigate the present position of the education services and to report on ways and means of financing them to the best advantage in the future. This resulted in a widespread realization on the part of the public that a more stable foundation to the revenue must be established, which would require wise long-term planning to diversify the economy and increase the output of the population as a whole.

The competition for secondary education has become fierce, for to many it appears the only road to employment with any worth-while remuneration. But secondary education for all who finish the primary course is an impossibility in the foreseeable future unless a drastic change comes over the country's economy. That is realized by all, but that realization does not still the demand for something beyond primary education which, whilst still non-vocational, would afford children unable to attend secondary school the opportunity to apply their newly acquired skills and knowledge and their developed intelligence to problems closely connected with their future lives. To achieve this, it is proposed to strive towards a shortening of the primary course proper, and to give two years of post-primary education of a more practical nature to those not proceeding to any form of secondary education.

From the 1958 census it is calculated that about 26 per cent of the potential primary school population is receiving some form of formal primary education. The percentage is higher, of course, in urban than in rural areas, where a tremendous amount of leeway has to be made up, particularly amongst the girls. Yet faced with the alternative possibilities of a few more primary schools or a small increase in secondary accommodation, public choice, at the present difficult juncture, has fallen on the latter, and the present proposals, over the next quinquennium, are for consolidation of the primary system as it now stands and the establishment of a boarding secondary school, to be run on co-educational lines, in Pemba. This school will probably develop rural science as a special study.

In addition, there has been rapid reaction on the part of the Indian communities to the fact that the secondary school door is not to be opened wider. They are determined that a greater proportion of their children shall have the opportunity of secondary education, and in Zanzibar Town three movements are afoot to establish private secondary classes. Their curriculum will of necessity be relatively limited, but they are endeavouring to provide curricula on as broad a basis as is possible within their limited means. These schools have commercial subjects as their 'pre-vocational studies' in place of the more expensive science studies offered at the government and grant-aided schools.

In the last year or so there has been a noticeable increase in the facilities for teaching in domestic science subjects. As one of the projects of the current education programme, the well-equipped Lady Rankine Domestic Science Centre will be opened this year in Zanzibar. It will not only serve the government girls' secondary school, but will provide classes for adults.

At the Conference on Muslim Education in East Africa, held in Dar-es-Salaam (Tanganyika) in November 1958, there was general agreement that the Muslim Academy should be expanded as an inter-territorial institution, to which students from the East Africa territories could be sent to receive a post-primary education on orthodox Muslim lines, that is, with the emphasis on religion and Arabic. Its students, after their 5-year course, could be a source of teachers-in-training who would subsequently be employed in the Muslim schools of the territories.

Lastly, as regards technical education and trade training, the Protectorate is too small to warrant the setting-up of its own technical institute, and for such training it must continue to look to the mainland centres. The Karimjee Trade School may be expanded to cater for trades other than building, but such developments must await firmer conclusions on the absorptive capacity of the Protectorate and the means of financing such expansion.

STATISTICS

Population (mid-year 1958 estimate): 304,000.
Area: 1,020 square miles; 2,643 square kilometres.
Population density: 298 per square mile; 115 per square kilometre.

Summary of school statistics, 1953–57. In 1957 about 34,700 children and young people or approximately 12 per cent of the total population were receiving some kind of instruction. Of the total enrolment over 96 per cent was in primary schools, including Koranic schools, 2.5 per cent in general secondary schools and about 1 per cent in vocational secondary and teacher training schools, including 36 students at the Mombasa Technical Institute, Kenya.

The proportion of girls to total enrolment was 37 per cent in all primary schools, including Koranic schools, compared with 32 per cent in 1953, and in all secondary schools 29 per cent in 1957 against about 23 per cent in 1953.

There was an increase in enrolment in all primary schools, excluding unaided Koranic schools, of 56 per cent between 1953 and 1957. Teachers in recognized primary (excluding unaided Koranic) schools in 1957 numbered 576, of whom 32 per cent were women. The average pupil-teacher ratio in primary schools was 28 in 1957.

Total enrolment in general secondary schools increased by 70 per cent between 1953 and 1957 and enrolment of girls by 69 per cent over the same period. In teacher training schools in Zanzibar enrolment increased by over 80 per cent between 1953 and 1957 and the number of women students from 12 to 54 (350 per cent). There were in addition 11 teacher trainees, including 5 women, in institutions outside Zanzibar in 1957. The number of teachers in general secondary and teacher training schools was 71 in 1957 and the average pupil-teacher ratio 14. (See Table 3.)

Educational finance, 1957. Total expenditure on education in the fiscal year beginning January 1957 amounted to 415,777 pounds sterling, representing approximately £1.5 per inhabitant. Of this sum 83 per cent (£344,963) came from territorial revenues, 7 per cent (£27,846) from United Kingdom funds and the remaining 10 per cent (£42,968) from voluntary agencies. Capital expenditure was about 15 per cent (£62,883) of the total. The distribution of recurring expenditure by level and type of education is given in Table 1.

3. Not including teachers of the Muslim Academy.
4. In addition the number of male students enrolled in the Mombasa Technical Institute in Kenya was 36 in 1957, 48 in 1956, 74 in 1955, 93 in 1954 and 71 in 1953.
5. In addition 11 (F. 5) students abroad.
6. In addition 4 (F. 1) students abroad.

BASUTOLAND

THE EDUCATIONAL SYSTEM

The school system is based essentially on partnership between the Department of Education and the various voluntary agencies, the Department having the role of co-ordination, fixing standards and supervising the schools. The Department is headed by a director and his deputy, with education officers responsible for each of the four circuits into which the territory is divided; inspection is assured at district level by assistant education officers or school supervisors.

Education is legally controlled by the Education Proclamation and by rules and regulations issued under it. The Government maintains few schools, the principal one being a technical school. A certain number of schools are managed by committees, but the great majority are run by missions. Grants-in-aid are paid to the voluntary agency schools subject to the conditions and standards officially prescribed.

Co-ordination of educational effort is achieved by advisory bodies at various levels. Each district has an advisory committee for dealing with applications for the registration of schools and with plans for future development. The Central Advisory Board on African Education acts in a similar way.

TYPES OF SECONDARY EDUCATION

The primary school course lasts 8 years, and leads to a departmental examination.

Secondary education covers five years, in two cycles 3+2, the lower cycle terminating in the junior certificate examination, and the upper in the matriculation or senior certificate examinations which are set by examining bodies in the Union of South Africa.

General secondary education is provided by junior secondary schools and by high schools with the full course. The curricula are determined to a large extent by examination requirements. The medium of instruction is English, with Sotho taken as a subject. Upon completing the secondary course, students may enrol for higher education at the Pius XII University College at Roma in the Territory.

Technical education is provided in technical and trade schools, where the course parallels the junior secondary; an effort is being made to raise the entrance level to junior certificate. A certain number of vocational subjects, such as commercial courses, are also offered in the high schools. The teacher training centres have courses of two years each at two levels: the primary teachers' course, immediately after primary school, and the primary higher teachers' course, for students who have completed the junior certificate.

STATISTICS

Population (mid-year 1958 estimate): 658,000.
Area: 11,716 square miles; 30,344 square kilometres.
Population density: 56 per square mile; 22 per square kilometre.

Summary of school statistics, 1953–57. In the school year 1957 there were 117,165 pupils enrolled in schools for Africans and Europeans, representing about 18 per cent of the total population; 97 per cent of enrolment was in primary schools where girls made up 63 per cent of the total. In general secondary schools, girls were about 37 per cent of total enrolment; in vocational and teacher training schools, however, they formed over 68 per cent. There were nearly 2,500 teachers in all schools and the pupil-teacher ratio was 49 in primary schools and about 13 in secondary general, vocational and teacher training schools. Compared with 1953 enrolment had increased by 20 per cent in primary, 31 per cent in general secondary and 97 per cent in teacher training schools. (See Table 2.)

Examination results in secondary education, 1955. In the year 1955, the latest year for which data are available, 80 students were awarded teacher training certificates at different grades, 67 students passed the junior secondary certificate and 7 the senior secondary certificate.

Educational finance, 1957/58. Total expenditure on education in the fiscal year beginning April 1957 was 541,055 pounds sterling, or approximately £0.8 per inhabitant. Of this total 7 per cent (£37,406) came from United Kingdom funds, 53 per cent (£284,273) from territorial revenue to the Central Government, 1 per cent (£4,111) from the Basotho Treasury and the remaining 39 per cent (£215,265) from voluntary agencies. Capital expenditure (£172,290) was 32 per cent of the total spent. The distribution of recurring expenditure by level and type of education is given in Table 1.

BECHUANALAND

The Bechuanaland Protectorate is a large, sparsely-populated territory, two-thirds of its area lying within the Kalahari Desert. The Bechuana proper are divided into eight main tribes, each with its own native authority, treasury and tribal boundaries. Other groups, such as the Damara, Makalaka, Mampukushu and Hottentots are either included within the tribal boundaries and are subject to tribal authorities or live in areas specially allocated to them. These groups differ from the Bechuana and from one another in language and customs, but there is only one official vernacular for the Territory, namely Tswana. The European residents number approximately 3,000. There is also a comparatively small Coloured population, a term loosely used to include Eurafricans and people of mixed descent, and an Indian community.

THE EDUCATIONAL SYSTEM

The great majority of the schools are African primary schools provided by the tribal authorities. These schools are financed by the native treasuries and in all matters not strictly professional are controlled by tribal school committees. There are also a few schools run by missions. The Government directly maintains and manages a small number of institutions, including all schools for European

children, and grants financial aid to the mission schools and to Moeng College, a secondary school operating under a special constitution.

The educational system as a whole is regulated by the Education Proclamation of 1938, under which the Resident Commissioner is empowered to frame rules for the establishment and conduct of schools in the Protectorate. There is as yet no question of introducing regulations requiring compulsory school attendance. The Education Department is responsible for administering the system, by preparing legislation and long-term plans, supervising the use of public funds for education and inspecting the work of the schools. It comprises the Director of Education, the Deputy Director, a number of education officers and supervisors, and a translator. The Education Department also maintains contact with the African and European Advisory Councils and is assisted by certain advisory bodies such as the Board of Advice on African Education, the Bechuanaland Protectorate African Teachers' Association, and the Protectorate Languages Board. All other Government Departments co-operative fully when common problems arise, e.g. in consideration of educational needs in relation to territorial development. Money spent on educational services derives from four sources—tribal treasuries, general revenue, the Colonial Development and Welfare Scheme, and mission funds.

African schools. The African primary schools offer a 4-year, 6-year or a full 8-year course (sub-standards A and B and standards 1 to 6). Education to secondary level is provided inside the Protectorate in two secondary schools, three junior secondary schools, the teacher training college and a homecrafts training centre. All schools are co-educational except the homecrafts centre. For other types of education, students attend institutions outside the Protectorate.

Coloured schools are all at primary level.

European schools also remain almost entirely primary. Since 1957 there have been junior secondary classes at the Francistown and Lobatsi schools, but the majority of the children leave at the end of the primary course and attend private or government schools in the Union of South Africa or in Rhodesia. Parents of promising children are encouraged to send them outside the Territory for their secondary education, and those requiring financial assistance are given bursaries. At present the European population is not large enough to warrant the introduction of full differentiated secondary courses.

The rest of this chapter will be concerned with African education only.

THE DEVELOPMENT OF SECONDARY EDUCATION

Before 1948 the only non-primary education in the Protectorate comprised junior secondary classes forming part of the Catholic St. Joseph's College near Gaberones, a homecrafts course conducted by the Dutch Reformed Church at Mochudi, and a small elementary teachers' course run by the Education Department at Kanye. For almost all secondary, vocational and higher education selected pupils attended institutions outside the Territory, notably the London Missionary Society's Institution at Tiger Kloof in the Cape Province (Union of South Africa). In 1948 a free grant was made available from Colonial Development and Welfare Funds for an 8-year educational programme including the erection and equipment of a teacher training college, the development of homecraft and agricultural education, and an increase in bursaries available for study abroad.

Another important event in that year was the beginning of the building of the Bamangwato College, planned as a full secondary boarding school on an agricultural basis. To finance the venture the then acting Chief Tshekedi Khama proposed a special levy on the Bamangwato tribe, and over £100,000 was raised by that means. In 1955 Colonial Development and Welfare Funds contributed funds for a classroom and office block and in 1956, on the unanimous recommendation of the African Advisory Council and with the consent of the Bamangwato, the college became a grant-aided institution serving the whole territory. At the same time it was re-named Moeng College. For parents unable to afford the boarding fees at Moeng College and St. Joseph's College junior secondary day schools were opened by the tribal authorities.

Since 1954, when the Union of South Africa ceased to admit non-European extra-territorial pupils to its secondary and vocational institutions, matriculation classes have been introduced at the two principal schools and arrangements made for admission of Bechuana pupils to trade courses and higher primary teacher training in Basutoland.

In 1956 the government teacher training college was opened at Lobatsi, replacing the former establishment at Kanye. It has accommodation for 120 students.

Administration. Moeng College is governed by a council under the chairmanship of the Deputy Director of Education. In 1956 the Government assumed the responsibility of meeting recurrent financial obligations and the cost of later developments of a capital nature. St. Joseph's College is managed by the Roman Catholic mission and receives grants-in-aid. Both these boarding schools charge fees, but generous bursary (scholarship) assistance is available for needy pupils and no deserving applicants have been refused. The whole bursaries system, including awards for post-secondary and other studies outside the Protectorate, is administered by a bursaries committee which comprises the Deputy Director of Education and two African representatives. The tribal junior secondary day schools are administered direct by district school communities; officers of the Education Department attend meetings of theses committees and their advice is invariably acted upon, subject only to the availability of funds. Each committee administering a tribal junior secondary school received a building grant-in-aid of £2,500 but otherwise the schools are financed by the tribal treasuries. The homecrafts centre run by the Dutch Reformed Church is grant-aided. The teacher training college is entirely maintained by government funds. All schools are inspected by the Department.

TYPES OF SECONDARY EDUCATION

Candidates for admission to the various types of schools at secondary level must have completed the 8-year primary

course and obtained a satisfactory pass in the external standard 6 examination set by the Education Department. The language of instruction at secondary level is English. All schools include religious instruction in the curriculum.

General secondary schools. Moeng College and St. Joseph's College offer academic-type courses leading in three years to the Junior Certificate examination of the University of South Africa and in five years to the South African Matriculation. The syllabus, and to a large extent the choice of textbooks, is determined by requirements of these two examinations. Subjects taught are English, Tswana, mathematics, general science, agriculture, history, geography, Latin and as non-examination subjects religious instruction, physical culture, health and domestic science.

Secondary leavers wishing to continue their studies go either to Pius XII University College in Basutoland, to the University College of Rhodesia and Nyasaland in Salisbury, or to the United Kingdom. For the first the entrance qualification is a good pass in the Matriculation examination of the South African Joint Matriculation Board. Entrance requirements at the University of Rhodesia and Nyasaland are considerably higher, but students wishing to attend there are admitted to a 2-year post-matriculation preparatory course at a government school in Southern Rhodesia. The provision of bursaries is generous. Bechuanaland students will be eligible for admission to the Medical School at the University of Natal up to and including 1961.

The tribal junior secondary day schools provide 3-year courses up to the Junior Certificate level. They offer training for admission to various forms of vocational training including nursing, primary higher teacher training and various trades. Subjects taught are English, Tswana, general science, domestic science, agriculture, arithmetic, history, geography and religious instruction.

Vocational and technical schools. Plans for a trades school, which will at first teach carpentry, building and motor mechanics, have been approved. Commercial courses at St. Joseph's College offer training in book-keeping, commercial arithmetic, typewriting, business methods and English. The homecrafts centre has two courses—a 2-year course for adolescents and a 1-year course for teachers already qualified who wish to specialize in the teaching of homecraft subjects. The 2-year post-primary course gives general training in practical home management and is designed to improve living standards in the villages.

Apart from institutions under the general control of the Education Department, vocational training for apprentices is provided at the Public Works Department Workshops in Gaberones, while the Veterinary Department trains its own employees. Vocational training for Bechuanaland students in schools and institutions in Basutoland and Southern Rhodesia has included agriculture, building, carpentry, commerce, domestic science, dressmaking, nursing and motor mechanics.

Teacher training. The Primary Lower Course, with entry from standard 6 (i.e. complete primary school), is of 3 years' duration. It includes professional and academic work and emphasizes teaching practice. Teachers are trained for work in the lower classes of the primary school. The Primary Higher Course trains teachers, mainly men, for work in standards 3 to 6. The course lasts 2 years, and the entrance qualification is a good pass in the Junior Certificate examination. The syllabus is the same as that followed in institutions in Basutoland.

Teachers. Graduate staff is recruited mainly from the Union of South Africa as not enough professionally qualified graduates are available. The junior secondary day schools employ graduate headmasters with local matriculated and professionally qualified non-graduate teachers. St. Joseph's College employs chiefly European missionary staff.

Out-of-class activities. There are games and athletic sports meetings, and concerts are a regular school activity. In the general secondary schools and the teacher training college corporate life is fostered by the wearing of uniforms and badges. In the secondary boarding schools at the teacher training college the staff is assisted in administration and discipline by a system of prefects whose powers are being gradually extended as experience is acquired and a sense of responsibility developed.

TRENDS AND PROBLEMS

Plans for the development of African education in the Protectorate are limited by the financial and economic resources available, and primary education takes first priority. Nevertheless, the steady improvement of facilities at secondary level is reflected in the rapid decrease in the number of Bechuanaland students attending extra-territorial institutions. Among the more immediate aims is that of establishing full differentiated courses at Moeng College and St. Joseph's College, under suitably qualified staff.

BIBLIOGRAPHY

BECHUANALAND (Protectorate). EDUCATION DEPARTMENT. *Annual report.* Mafeking.

STATISTICS

Population (mid-year 1958 estimate): 334,000.
Area: 275,000 square miles; 712,249 square kilometres.
Population density: 1 per square mile; 0.5 per square kilometre.

Summary of school statistics, 1953–57. In 1957 total enrolment was 29,500, representing approximately 9 per cent of the population. Of these pupils nearly 99 per cent were in primary schools. The proportion of girls enrolled was

about 60 per cent in primary schools, and over 40 per cent in general secondary schools; 49 per cent of the teachers in primary schools were women. The average pupil-teacher ratio was 37 in primary schools and 11 in general secondary schools. Compared with 1953, enrolment had increased by 56 per cent in primary schools and by 120 per cent in general secondary schools. In the teacher training college, the number of students increased from 50 in 1953 to 69 in 1957 of whom 37 were women. Girls enrolled in the homecrafts centre numbered 23 in 1957 compared with 9 in 1953.
